View in the Gardens at Bobahan (vee Supplementary Illastration). - The accompanying illuatration rep:esent one of the many charming bits of acenery to be found round Bushan, the Cornish seat of Mr. Pendagres Vivian, aituated about 6 mile from Fulmouth, on the $H \rightarrow l f$ grd River, and commanding lovely and extensive sea and land viewa. The mansion way completed, and the grounde and gardens laid out in 1887. Tae Gannera manicata here depicted wes a mall nursery plan: five years ago; it now measures 24 feet through, 12 feet high, and average about 8 feet accose the leaves. It is planted adjacent to a pond, and seems to be quite at home, retaining its handsome appearance until quite late into the autumn, and is amply covered over with it own leaves a protection from frost when winter atte in. Amongst the many half-tender plant foand here may be mentioned Eacalpptas globulus (as note the large one to tha left of the illastration). Cordyline aatralis and C. indivins, Embothrium coccineam, and Palme, including Chamærop: Fortanei, C. excolea, and C. humilis, some of which have attained a beight of 10 feet; alio Raphis flabellifurmis, Subal Blackburnians, and Phouiarupicala; these exiat out-ofdoors all the year round, and so far with marked aucceas. In one of the litule glens may be seen a clump of some twent $\bar{j}$-seven Trea Ferns (Dicksonia antarctica), varying from 2 to 10 feet high, which were imported direct from New Z igland , which
year ago, which are now looking as iresh and green as if they were under glass. As bowing the mild nese of the climate, it may be mentioaed that $10^{\circ}$ of frost wa the maximum we had during last winter, which wat elsewhere considered quite an exception. ally hard one. Thomas Crawford.

Mr. Barron's Dismissal.-An the circum. stances connected with the dismisal of Mr. Barror have become known, a feeling has ariven that the Conncil has committed a blunder by appointing, anknown to their own garden committee, a number of private gardeners to visit and report on the condition of a garden, the orjects of which are a different from those of which they have cognizance. That the Council should have taken such a step, and farther that they mould have dismised their Saperintendent aluo without crnsulting the Chiswick Board, shown something more than a want of coarteay. The treatment accorded to Mr. Barron is also felt as a aluron the commanity of which he is so distinguisheds repreaentative. That such a reault should have been, as we believe it was, unintentional, only hows the gravity of the blander. In the meantime the warment sympathy ia felt for Mr. Barron.

We learn that at a meeting of the Fruit Committee held at Chiswick last week, it wu resolved, after diacumion, to invite the memben of the committee to attend a apecial meeting of the body to be held at Chiswick on September 10, to consider the denirability of this body proo moting a special testimonial to Mr. Barron from the membera in recognition of his long and valued services to the committee as it secretary. If is proposed that contribations be restricted to pass and present members of the committee, and that uader no circumstances should the proposed tentimonial conflict with any other originated from the general body of fellows of the Royal Horticultunl Society, A meeting for a aimilar purpose will bo held as the "Windsor Hotel," on Tueaday next, at 3 Pm .

Royal horticultural Society.-The next meeting of the Royal Horticultural Society will bo held on Tuesday, August 27, in the Drill Hall, James Streeb, Victoria Street, Westminster. $\Delta$ 3 o'clock a paper by Mr. C. F. Bause, on "Codians and Dracæaas," will be read.

Great Grimaby Flower Show.-The fint horticultural show at this town was held under the aupices of the Great Grimsby Gardeners' and Amateurs' Mutual Improvement Society, and took place on Thareday, August 8, in the Vicary grounds. The opening ceremony wa performed a 2 p.m by Mra. G. Marshall, who was eupported by Mr. G. Marshall, Mr. and Mrs. Jack Satclifite Councillors H. J. Curry, W. Goodwin, and otheth Mach of the success of the undertaking was due to the untining exertions of the secretariet, Meum. J. L. Robinson and F. Isle. The treaturest at Mearr. J. Norton and W. Williammith. Special features of the show were the group of miccelianeow plants. Cat flower were excellent, eapecisily to 0 Rones sent by Mears. Pennell \& Son, nurnerymen, of Lincoln. Fruit was well, if not very abundandly, shown. There was an open division, which included groups, stove and greenhouse plants, table planth Ferns, Taberoun Begonias, Dahlias, Coleas, Glos. ioias, and Fachaias: cut flowers, under pariout headings of the flowers in season, an Anterth Gladioluy, Marigolds (dearly loved in the North) Carnations, and Picoteen; bonquets of rariol kinds; fruit of almost all kinds; also regetsoled An amateurs' division, in which the more in int meane and appliances of the grower, who in iot "gardener," are talken into account. This dimble included plants, cat flowers, fruit, and regetabe and, finally, there wan the division in which com tager (and, we auppone, allotment-bolders) peted, and which wat open to resideat ite borough oaly. This is a division, the to durib which require considerable extension, 00 sf to the of greater variety of produce being groms

Chiswick - The garden is now looking particalarly well. The collection of Phloxes is a sight to be seen, whilst the beds of Zinniss, Taa $R$ isem Bogonias, and other plants are remarkably good. The fruit crops are generally satisfactory. Some of the houses are fall of Fachsias and Cannas, so that a visit just now will well repay the gardener.
newcastle and District Horticultural Mutual Improvement Society.-The monthly meeting of this society was held at their room, 25, Westgate Road, on Taesday, August 13, Mr. Larke, North Dene, Gaterhead, presiding over a good attendance of members. The secretary, Mr. J. Elliot, Jun., read a paper on the Cyclamen, in which he recommended nowing the seed in Jaly and Angust, or as soon as it was ripe, in preference to the spring. A discussion followed, in which many took part.

Mr. SOWERBY.-Coincident with the retirement of Mr. Barron from Chiswick comes news of the withdrawal of Mr. Sowerby from the management of the garden at the Regent' Park, with which he has so long been connected. Mr. J. B. Sowerby succeeds to the post vacated by his father.

Woburn Experimental Fruit Farm-a party of ferty agricultural stadents attached to the summer college of the Bedfordshire County Council, visited the above farm on Tuesday, August 20, by permiasion of his grace the Dake of Bedford and Spencer Picigeing, Esq. They were conducted over the groundr by the manager, Mr. Castle, and the general scope of the experiments already commenced was explained. Mach interent in the work was evinced by the visitors, who were chiefly achoolmaters engaged in the county, and who are qualifying for teaching classes under the technical education department.

Hardy Plant Collecting. - In the columas of the Garden, Mr. Burbidge advocates the formation of a club or co-operative society for the parpose of defraying the expensea of reaident collectors in various coantries. In this way the services of consuls, missionaries, and traders could be utilised. An organising secretary is needed, and the services of a competent botanist to indicate likely countrie and desirable plants, and to identify them when received are also denirable.

Addition to the lincoln Abboretum.-The formal ceremony of opening the new portion recently added to the Lincoln Arboretum took place on Wedneaday afternoon, August 14. The piece of land, about an acre in extent, was parchased by the late Mr. Nathaniel Clayton, to prevent the building of house overlooking the mansion and grounds known an Eantcliffe, and last year was presented to the Corporation by Mr. N. C. Coceberen, his grandson, on the underatanding that no bailding, unless it be a lodge, should be erected thereon. The land has been handsomely laid out with flower-beds and trees. Inside the entrance-gate is a granite slab setting forth that the land was the gift of Mr. N. C. Cockburn. The cost of the work is about $£ 1000$. At the opening ceremony, Mr. G. H. Pact, chairman of the Arboretum Committee, presented the Mayoress, Mra. A. W. Hall, with a silver-gilt key, which fit the lock to the entrance gate. She then declared the new portion open, and votes of thanks to the donor of the land, to the Mayoress for her servicen, and to Mr. H. E. Milner, of Westminster (who farnished the design), were patsed. The Yorkshire Daily Post.

## Aponogeton digtachyon Var. lagrangel,

 ANDfE-This is a seedling variety, raised at Oallins (Rhone) by M. Lagbangr. It differ from the type in ita larger leaves, parple on the undersurface, and in the floral bracts being of a dull rosecolour. A coloured figure is given in the Revue Horticole for Aogant 16.Rubus Capensis -In the Garden for Aug. 17 is in illutration of this interesting specien from
a photograph received from Mr. Burbank, Santa Rona, Calitornia. The leaf in palmately 5 -lobed and ragone, like a Malberry-leaf. The fruit is parplish and of excellent quality. It is supposed it may be the Rabue of which Stanley speak an growing in places in tropical Africa.

Winter in New South Wales - Briton are apt to think that the right to a peculiar and changeable climate, and the habit of making it the topic of everyday converation, is exclasively their own. Oar correspondence with all parts of the world often pats as in possession of information proving that, in neither particular, are they different from their brethren in what are considered more favoured climes, for everywhere peculiar weather looks in at timen, and those experiencing it think it is fair game to talk or write abont. Writing from New South Wales under date July 8, 1895, our correspondent, "J. H. K" ays: "I think this is the mont severe winter I have experienced in this country during the long time I have been here. Every morning during the past week there have been $8^{\circ}$ to $9^{\circ}$ of frost, and consequently some of our shrabs have auffered, Allamanda neriifolia and the Melastomar in particular. The Bougainvilleas are uninjured. I am surprised to find what a hardy old thing B. apeciosa is, Siveral large pieces growing in my garden have been repeatedly frozen, not only this season, but previously, and come out quite anharmed. My experience is, that the more exposure it gets the freer it blooms.

Peter Lawbon \& Son, Limited.-At the ordinary general meeting of the shareholders of this company, held on Tharsday, Augast 15, within the registered office, No. 1a, George IV. Bridge, Edinburgh, the report as issued to the shareholders was unanimously adopted, recommending a dividend of five per cent. per annum on the paid-ap capital, free of income tax, should be paid on September 2. and that the balance of $£ 46830 \mathrm{~s}, 3 \mathrm{~d}$, be carried forward to next year's account. The retiring directorn, James S Eastes, Eiq., Ashford, Kent, and Andrew Patrrson, Eeq, C.A., Edinburgh, were re-elected.

DIsA arANDIFLORA.-We have had sent for our inapection by Mr. H. Bailey, the gardener at The Briars, Reigate, some flowers of Disa grandiflora which are of an antonishingly large siza, most of them measuring on arrival 5 inches from the tips of the sepals to that of the lip. As cat lowers, these Disas are admirable, lasting in water for quite one week. Mr. Bailey has been waccessfal in flowering these plants for the past twelve yearn.
"Botanical Magazine,"-The Auguat number contains coloured figures and devcriptions of the following plants:-
Prochynanthes Bulliana, Baker, t. 7427.-This is the plant described by Mr. BaEER in our columns in 1834 , ii., 328, as Bravoa Bulliana. As a genus, it is intermediate between Polianthes and Bravoa, having bell-shaped purplish flowers, curiously bent downwards in the middle. It in a native of Maxico, and flowered at $\mathrm{K}_{9}$ w in 1894.

Saccolabium Mooreanum, Rolfe, t. 7428 ,
Spirce bracteata, Sabel, to 7429.-A Japanese apecien, which hat been called in gardens S. media or S. rotundifolia, or S. rotundifolia var, media. We hope the nomenclature may now be conaidered nettlez.

Pyrus sikkimensis. Hook. f.-A Himalayan Crabapple flowering at $\mathrm{K}_{\theta}$, and presumably introduced from Sikkim by Sir Jcesph Hooker.

Pleurothallis Ecapha, Fchb. f., in Gardeners' Chronicle, 1874, vol. ii., 162.

Melon Growing and Artificial Manure.The gardener at Minstead Manor forwards a photograph of a Melon-house under his care, to whow the offict of the Cbelsea Manure. The manure, he says, soon tateseffict, and be was easabled to cut 175 fraita from fifteen plants on which it wss used, the total weight of which was $4 \mathrm{cwt}$.1 qr .2 lb .
M. J. Vesque.-We hear with great concern of the death of M. Julign Vesque, one of the most accomplithed botanists of France. M. Vesque paid great attention to physiological botany ia its application to agriculture and gardening. The relation of minute atructare to fanction and the adaptations to altered conditions were atudied by him with anccess. Oae of his lateat works was a volume of the Suites aus Prodromus, devoted to a Monograph of the Guttiferæ, in which the anatomical structare of the leaves is made use of as a "character" to be utilised with others in the diacrimination and delimitation of apecies. We have no doubt that similar monographe will in future be compiled.

The Supplying of Bulbs to the london Park8.-Mearts. James Cabter \& Co, meed merchante, 237, 238, 246, and 97, High Holbord, London, W.C., have again been honoured with the command of Her Majeaty' Commianioner of Work to supply the balbs for the Royal Parks of London and they have alao received a similar favour from the London County Council for the parke, gardens, and open pacea ander their control.

## BOOK NOTICE.

## A Garden of Pleasure. By E. V. B.

## (Elliot Stock.)

The pleamant articles in our columas descriptive of a Buckinghamshire garden, and reprinted under the title Days and Hours in a Garden, are still held in fresh remembrance. The prement volume is of a nimilar character. Ita records pertain mostly, if not entirely, to the ame gardea, and they are framed in the ame refined, aympathetic, and original way. They are not meant to be criticised, bat merely to be read and enjoyed. Oue or two points we may be permitted to allude to, and firat as to the graciona remembrance of the gardener.

- And now, departing not from the custom which holds with letters as with prefaces, and by which the last word is woat to be the most important, a word must bs said for the Chief Toiler of the garden, in whose hands lies the responsibility of success or failure. Perhaps there masy not be many who success or failure. Perhsps there mach lines as these; not would choose s gardener on such thes candidate into many would, so to speak, tais, the candidato int the garden, and pointing to a Cibsige or a Currant-bush, give the order thus :- Dig a hole and plant diat currant head downwards, and if forthwith the man did as he was
told without a word, engage him on the spot ! Yot I bolieve such imperiousness does exist, and then-is fatal to the garden. We may love dearly our flowers; we may know (or think we know) everythiag about them, and call them all by their names. We may believe wo are Master, and that things being done entirely under our directioas, evergthing will grow, and all will bs well. Yet nevertheless nothing will grow, nothing will be well unless the gardener is also in Will grow, nothiax will a sense, on his sile, master. Oll aff iirs which cums spesially give him a free hand over all aff niry which cumg speciany under his control. Give him a living interest in the garden by letting him exercise his tiste (subject al ways to yours) in planting and in arraggemant of olloscy, \&c., a ad by showing your own constant interest in it; and if the $m a n$ be possessed of grod Intelligence and Experieace, if his heart 18 in his work, if he has it in him to Susseed, suczeed he will. The garden and the gardeaer will grow, as it were, to underatand one another, and you to trust and understand them both, while your content and g'alaess in the garden will increase and grow with the yesra' increase.
"And here a grateful tribute must find placs, for the gardener, Jesse Foute. by whose rare skill this plot grew into a Garden of Pleasure, whose ceaseless csre has maintained its Garden of Pleasure, whose cesseless and who completes the charm for three and twenty summers, and 2nd of May (1895), Thirtieth year of his devoted service oa the 2 2nd of
with which well-omened date I olose my Preface."
With auch reciprocal good feeling all ought to go well, and generally doas go well, in apite of the contrarieties that alwaye will ariee in the bent regalated of gardens, from canser bejond the control of master or man. To one other aubject wo may refer, in the hope that the dathoress may clas the matter up.

With reference to the introduction of the Pineapple to this country, there are some discrepancies. "E. V. B." here tells us that Juha Tradencant lived once at Dorney Court, near Maidenhead : -
"There is some tradition that there be presented his Pineapple to Charles If, and it is not many years since a little warside publichouse near retsinet still the sign of a Pine apple. The [Pine-apple] was the first grown in England. At Dorney Court there is an old engraving which represents Tradescint kneeling bafore the King in a gardea presenting his Pine-apple."

So far "E. V. B." Bat according to Johnuon's Hitory of English Gardening, it was John Rose, gardener to Charlea II., at St. James's Palace, who presented his Majeaty with the firat Pine. "There is a portrait of Rose in oils at Konaington Palace, representing him giving the firat Pine-apple caltirased in Eogland to Charles II., whilat that monarch was on a visit to Ros'a's mistrens, the Dachess of Cleveland, at Dawney (sic) Coart, Backinghamshire." John Evelya savg he saw the firat Pineapple presented to the King ia 1661 , and twentyseven yeara later he was priviluged at the Banquetinghouse to taste a pieca from His Majasty'm owa plate but apparently he was not couttier enough to fall into ecstacies over it.
A copy in water-colours of the pictare in Kensingtor Paince above referred to, was in the library of the Rayal Horticultaral Society even no lately as the time when the Lindley Library was housed in the nearly inaccessible shed at South Kensiagton, but, anfortanately, it has disappeared, and we believe it hat not been seen since the transfer of the booke from South Kenaington to Victoria Street. It may be that this Pine was not grown here, bat in Holland.
In any case, we have Tradescant and Rose, St. Jamen's Palace, Kensington Palace, Durney Court, and the Banqueting-hoase, all mentioned in connection with the first Pine grown in this country. It is not likely that both the gardeners and all the localitien mentioned were concerned in the matter. What, then, is the true version?
It is probable that there is some confusion between the Pine imported from Barbados and elsewhere, and that which was really ripened under an Eaglish sun. It is alao on record that another Charlen, that is Charles V., was offered a Pine-apple, but refused it, and declined to tasto ito Batter authenticated casen of Pines presented for Royal acceptance are that weighing $9 \mathrm{lb}, 40 \mathrm{z}_{\text {, }}$, and pre*anted in June, 1820, to his Majesty Grorge IV. by John Elwards, Evq., of Rheola, Glamorganehire In 1821 another frait of the gamas variety, and weighing 10 lb .8 uz., was grown at Stackpool Court Gardens by Mr. Bachan, gro to Lh. Cawdor, and forwarded by the Royal Horticultural Society to his Majesty. This frait was served up at dessert at the coronation banquet.
Oar suthor's book has rendered un diecarsive. It is perminaible to be no in due eason. Last thuse intereated in gardens who want a plenasat book to stow away in their portmantean for pornasl during
vacation hours not forget this vacation hours not forget this Garden of Pleasure.

## RAVENSCOURT PARK, HAM MERSMITH.

Anonast the maller suburban parks under the control of the Loadon County Council, thier (sbout 35 acter in extent) certainly ranks as one of the prettiest and bent kept. The grounds here, when in the posseasion of the late George Scots, Esq., were laid-out by the famous landecape-gardever, Repton, Who made great improvementw. A very fine avenue Of Eime leading to the houre (now converted into a Free Pablic Library) in a fentare of the place. This
way formerly the Manor-houne, and way ealled Ravenseourt, a capital mansion, built in the atyle of the French architect, Manart.
The placz has interesting horticaltaral associations, for opponite to one of the main entrances to the Park once lived Lonis Weltjie, Esqu, at that time a famous grower of Auriculat; his nama is atill perpetuated in Weltjie Rosd. Not a atone's-throw from here lived, too, one who in hia day made himnalf famour by his culture of Dablias and Celeryto wit, the late Charles Lidgard, of the Old Thatched House. Hammerrmith will alwaye be noteworthy
from a horticaltural point of view in connection withen from a horticaltural point of view in connection with
the very old firm of Lise. the very old firm of Lse.
Returning to the Park, it in a great boon an an open apace to the inhabituate of Hacruenonith, with
itr beatiful flower bodf, stately trees, wisding
walks, und sequentered eeats, and lake. Several
improvement have recently been carried out. An addition to the lake has been made by carrying the water round some large trees, forming an island which has greatly improved ita appearance, and will give increased facilities for akating.
The roagh piece of ground adjoining the main road has been laid out in beds and shrubberies, the bare places between the newly-planted shruba being filled up with a good selection of Canterbury Balls, Carnations, and varions bedding plantes, edged with Violas, making quite a bright and pleasing display. Oae long border was very gay with an edging of Viola picturata, a profuse bloomer. The effect produced by these mixed borders is far preferable to the formal lines so often seen. A great advantage possessed by the mixed aystem is, that as the plants go ont of fower they can be replenished without much tronble from the remerve-ground, not necessitating the taking up whole lines of plants.
Pelargoniums are not used in any $\mathrm{o}^{5}$ the beds, but in the mized borders Fachaias were largely used for beds, and dotted on the grass; how effective and graceful they are used in the latter way! A very large acroll-bed (of which we give a sketch, fig. 44) was an effective feature, being done in a free-hand design, representing a trailing stem with leaves. The main stem or scroll was composed of Alternanthera versicolor, the large leaves were done with $\mathrm{A}_{\text {. }}$ magnifica, small leaves with A. aurea, the groundwork being Sedum glancam.
Several beds were edged with a very profuse blooming dwarf white Alyssum, which $\Upsilon$ have not seen before. The rockery here is getting established, and is a source of interest when its various occapants are in flower. It should be mentioned that the park is well managed by Mr. W. B. Gingell, who has effected several mach-appreciated improvements aince he took charge some five years since.
Other plants nsed in the design are Kleinia repens for the larger leaf-veina, Alternanthera aurea for the maller onen, Echeveria secunda glanca for the edging; whilst Herniaria glabra, green Sempervivum and Mesembryanthemum cordifoliam variegatum are also ased in places which the limited size of our illastration does not permit as to indicate specially. J. $B$.

## home Correspondenoe.

A NEW VARIETY OF GOOBEBERRY,-I have ment you a few Gooseberries for your inspection, which I have named White Warrington, the reault of a sport. Never having zeen any myaelf before, nor anyone about here, I think they will be a great acquisition, as evary gardener knows the good qualities of the Rod Warrington. I have two nice bushes, and have had them for six years, and they alway: keep the same. Pleane let me know if you have ever meen or heard of any before. L Dow, Newbyth, Prestonkirk, N.B. [It is identical in shape of berry, hairyness, and flavour to the Rad Warrington, and is likely to become as great a favourite as a demert variety as that one. The sin is fairly tough, as in the red Eariety, and the berry should be se good a kreper.

PREAERVING FRUIT.-In reply to the variona queries of Mr. D. T. Fibh in the Gardeners' Chronicle of August 17, p. 180, upon the sabject of preserviag fruit, I beg to submit the following replien: -1 . The time for the development of the maximum propertien of the gelatinising of fruit in the process of preserving them should not exceed one hour. The time mut of necesaity vary according to the juicynews of the frait, 2. The maximum time for the developInent of fruit jelly should not exceed twenty minutfs. Pariscusion which followed the delivery of Mins Parios's lecture, she repeated her remarks about pectine, to impress apon the mind of the audience the fact that much cooking of frut in making jelly tands to impair the quality of the jully; and that in many casen the product in not jolly, bacause that principle in the fruit had been expelled by the cooking, leaving a thick syrupy fuid. 3. With regard to the a of Lemon jaice to keep frnit white after paring, it would appear that the acid form: an organic compound on the outsides of the fruit which prevente the discolouring. 4. It is most probable Eaglish housewives. J. J. Willis, Harpendes deaied to

SLUGS AND WORM8.-The animal which Mr. Robert Warner mentions in your issue of the 17 th inst. under the name of the "earth-alug" is evidently a Teatacella, which is the only Britioh genus of sluge which have an external ahell (which is aituated at the end of the tail), and which feed on live worms. The large black alag, Arion ater, is reported to eat worms, but my observations during more than fifty years incline me to the belief that Arion ater want somebody to catch and kill a worm before he could make a meal of it. W. Tr Bishopsteignton.

8LUGS DE8CENDING BY A LINE OF SLIME.-The several commanications in your lat two number are very interesting, bat only confirm what has long been known to tudents of British mollasca. If Mr, De B. Crawshay will kindly send mo the next specimen he may find alive, I shall be plersed to identify it for him. I saspect it mey prove to be Limax arborum, as I have caught this species coming down from a tree in Knole Park, Sevenoaks, within a mile of Mr. Crawshay's house. Ojher aluga known to descend and climb, are L. agrestie, which is creamy or pale grey, and about 1 inch long; and $L$, Sowerbii (formerly kanwn as L. carinatus), which is chocolatecoloured, has an orange keel down the middle of the back, and is 2 inches long. Both these pecies are common at Sevenoaks. W. Thomson, Bishopsteignton, South Devon.

FAILURE OF PLANTS OF SUMMER.FLOWERING ASTERS. - I send herewith two or three Asters which have gone to the bad. Can you tell me in your next isane the cause, and, if possible, the remedy? I have only lost about a dozen plants in this way. They are perfectly healthy one day, and next morning they look as if the leather grab had been doing his worst, but I have not been able to find the calprit. I am told that a gentleman in Spalding, whom I know very well, paid no less than £8 this year for Aster seed and plants. He has a very extensive garden, and I have bat a mall one; notwithstanding this, however, I have at the present moment perhaps the finest show of Asters in the diatrict. It is very annoying to have your planta go off just as they are coming into bloom, and I hear that his plants have served him the same trick. Any information or advice will be thankfully received by Rohert King. [An expert to whom we sent the plants writer:- " The plants are perfectly free from all forms of fangoid disease, and I cannot suggent any cause for their pecaliar behaviour. G. M." ED.]
bedding arrangements in st. james's PARK.-On entering the park from the entrance on the western side of the Horse Guarda Parade-ground, on the left will be seen some groaps of plants on the grast, consissing of Dracæna, mixed Fachsias, and Heliotropes, which now look very well. Going furtber west, we come to a mixed border of Fuchais, Heliotropen, Canass, Marguerites, Nicotiana afinis, Pentotemoza, \&c., farniahiog a krand appearance. Here are also five beds (three circles and two oblongs) ; the oblong becls are planted with Iryleaved Polargoniuma Ryecroft Sarpriep, with a carpet of mixed Violae. Three circlen:- The ceatre bed is Fuchaia Marinka, having a carpet of Alteraanthers major; the two end bed lnoking very good, being planted with Fuchsia Mrs. Rundell, having a carpet of Alternanthera major, and nome dot planta of Abutilon Boule de Neige. As the rear of thete beds is a large circuiar bed, planted with mixed sub-tropical planta, which are doing well. Still further wat il a dell haviog plant of Muas Eacole and Palma, planged in the grase, and preseatiog quite a tropical apparance. Most of the bordert in the park have their margin planted with the unall ammer bedding plants. Bold masive groapl of Iris, Pulygonum, and other plantis at the edgo ornamental the ornamantal water give the park quite a naique and effective tinish. In the equare near the Hoace of Parliament there are some beds which at the present time are doing well; they are planted witu Fachsias, Pelargoniams, Cannas, and Eacalyptare Considering that they are sarrounded by dasty ronds and other anfaroarable conditions, is amply demon trater what can be done ia a gadening was
may be called the heart of Condon. J. $B$.

THE DOUBLE ROCKET.-Of this old inhabitatit of our gardens there are three variaties, as far st in own knowledge goen-riz., the trae doable whe which one fiads in Lancashire, Yorkshire, and the norti, which doss not appear to do well in ingthern courtiov; the talter and more robuter the)
are become tinted with pale lilac; and the double parple, which in inferior as a decorative plant to either of the foregoing. A fourth might be addedthe double yellow-Alowered Barbarea valgaris, which is known in ome localitiss as the doable yellow locket. The firt threo appesw to be getting scarce planta, they were acarce fifty years ago, and it mometime does badly, and hence it appears to be worn out. I do not believe that the plant is worn out; any lone of vigoar may, I think, be owing to improper calture or neglect. The double Rocket is a plant that decline in health an moon as it is neglected, and there is no dou'st but that the fine specimen ometimes met with in cottage garden are petted plants, and therefore well looked after. Of method of propagation, that by means of catting is preferable to diviaion of the roots in September. The adrantage of propagating by cattings is that the plants have more time to establish themelves before inclement weather sets in. Cattinge should be taken When the shoots are 10 to 12 inches in leagth, dividing them into three joints in length, the
ome flattering noter I msde last year of the fine trees seen in the Bournemouth Cemetery. These were pictores of health, verdare and beauty, with no trace of the rusting or dying off the lower branchet that so often mars the symmetry and beaty of Arsucarisn. The lines along each side of the msin walk were in robust health, and apecially green and flourishing. It seeme a mistake to call any number of lines of Chili Pines avenues, as most of associate the name with lines of overarching verdure and bearty, and it would be impossible for Araucarias to form such avenues, however high or wide they might grow. Neverthelens, regular linea or ranka of atately Araucarias, or groups or masen of them, where they do as well as around Bournemontb, Bicton, and a few other places, have a striking and a very original appearence. Possibly. Mr. Ward is right about the soil being somewhat light mandy peat about B uarnemouth. Tae common Scotch and other Firs thrive well in it, and oo doen the Araucaris. And yat I have seen the Chili Pine do well on loam: of various textare. Provided the latter is well drained, fairly dry, a moist genial atmonphere has
that were in water on the counter, viz.. Lottie Eck ford, Emily Henderson, and Princens Beatrice. The firnt being white tipped with blue, the necond a well-known white, and the third a deep pink. H, did what he andertook to do, although the thower wer changed into other glases, and correctly naming each of the three varietien by it fragrance only. The manner in which the teating was done is given in the words of an onlooker, and is too long for un to insert. ED] I do not give this through egotism to the readers of the Gardeners' Chronicle as being anything wonderful, but venture to angent that colour in flowern may bave something to do with perfume. In Rosep, for inatance, the rich crimson are always the richent in odour. [How about Marechal Niel? ED]; and I think Rosegrowern may, blindfolded, be abie to do with Rosen what I did with Sweet Peas. Certainly the one called Cardinal, in scarlet, is to my mind, slmost the finet in perfurne, excepting Princes Beatrice, a rich pink. The variety Emily Henderson is the weakest. but the best of whites. What say your readers? Wm. Baylor Hartland, Ard Cairn, Cork.

terminal bud being taken out, otherwise it may become a blooming thoot. A bed for the reception of the cutting ahould be prepared uader a wall, or better atill, in a small frams; and a compost for them to be inserted in, made up by mixing threeparts of goud mellow loam with one of sharp esand, taking care the latter is in quantity near the aurface. The cuttiage shoald be iaserted with two eyes or buds below the surface; a good uprinkling is then given, the light placed on the frame, and the cuttings shaded from the gnn, water being afforded as may be required. When treated in this way, cutting rarely fail to roat. An old gardener, who was very accossful with the culture of the double Rocket, staten:- "Where it is wished to grow this plant in a high state of perfection, care should be taken that no manure whatever forms a part of the soil in which they are planted, an it will cause a strong exaberant growth, and materially diminish the chances of propagation, either by cattings or divivion." The doable Rocket does well in a good fresh loam, with which a little leaf-ioil may be mixed if thought to be too heavy; in anch the plants will grow atocky, they will throw up many otems, and bloom in thick dense spiken 1 foot or mo in length. Soms of the old growers who made a pet of thit plant would allow their plante to bloom bat twics only, considering they had reached their higheat stage of perfection when they flowered the second time. A few cuttings whould therefore be atruck every year, so that a axccemion of plante may be assured. $A$. D.
araucaria imbaicata at bournemouth Mr. H. W. Ward'e remarks sboat the fine Chili Pines at B-ankeme Daan Park. Alderbury Vicarage, in the Gardeners' Chronicle for Jaly 20, reminds me of
probsbly more to do with ite verdure and health than any particalar moil. At Catile Keanedy in Scotland, as well as in other genial places throughout the Uaited Kingdom, fine Arancarias may be met with. Bat in Eat Anglia, the climate seems too dry for it, I had, however, a fine specimen under my care for tome years at Glevering Hall near Woodbridge: this was said to be one of the earliest imported. Fur many yearn it continued a picture of health and beanty. No surface care, however, nor top-dressing could stop the bottom branches from rasting off. This fine apecimen, however, was on heavy losm. Other on lighter oils, however, followed ita example after a time, and the majority of the Chili Piaes in many moist localitien. Even at Bicton in Devon, under the skilfal cultare and planting of the late Mo. Jamea Burnen, so distinguished for hir cultivation of this and other hardy and semi-hardy treen and shrubr, and where the Araucaria grew so freely, and coned so well, that not a few began to see in it a future source of food grown in the ine inde, not a few of the fine atately, trees became more or leas ragged. And Mr. Barnes' bold venture of growing and ripening Pine-apples in the open air is about as likely to be realised as the saccesaful cultare of the Chili Pine to the higheat perfection of aymmetry and verdure. D. T. F.
colour and perfume in sweet pear.-Have any of gour reader obsprved how different are the perfomes of Sweet Paas? Some of them have that of the Rone, all more or less quite distinct from each other. The white varintie are particularly weal in odour, while the scarlets and pinki are very strong. To-day I ventared to maggent to a few friends, and my warehoune assistante, that I could blind-folded tell the names and coloure of three very distinct varieties

## Law Notes.

THE NATIVE GUANO CO. $v$. HIBBERD.
Is the City of London Court, before Mr. Commisaioner Kerr, the cane of the Native Ganno Co. Lid. $v$. Hibberd was heard, in which the plaintiff company, of 29 , New Bridge Street, E.C., nought to recover from the defendant, Mr. Henry Hibberd, gardener, Grange View, Batley, Hants, the anm of £3 for guano aupplied. Mr. Jame Welfare appeared for the plaintiff company. The defendant said the reason he declined to pay for the gano was because the material which wan sant to him tarned out to be different to what it was represented he should have. He had to give it a trial before he knew what it wae like, and so he had broken into it. $A$ soon at he found out what it was really like he wrote to the plaintiff company and diapzted bis liability. Mr. Commisnioner Kerr mid it might be useful to the defendant and other to know that when be received good which were not according to the reprenentation he ahould at once return them, and on no account keep them on his premiset. He had been telling people for a long time, but they did not seem to pay attention to what he told them. The defendant might bring an action for damagea if he liked, but in future he must see that he received the right suff. For thirty yeara he had been warning people againot the advertised ataff which were continually sold. Tone only thing be could do was to find for the plaintiff for the amount claimed, and give them the costs of the litiggtion.

A Question in the Seed Trade.
Mesmra. Toogood \& Sons, reedımen, were sum moned before the Southampton magistrates on Tues day for selling weeds improperly described. Mr. E.J Trustram proeccated, and Mr. Page defended. The question raised was whether the seed trade generally was allowed to sell a particalar kind of seed which hat been named after the original prodacer, or whether the inference should be gathered that in consequence of that seed having a particalar producer's name, it must necessarily have been produced by him. Mr. Shephard, seedaman, of Stockbridge stated that after many yeara' trial he had produced Shephard's Kale, which was registered as a trade-mark, and which he aupplied to farmers only, and not wholeale. He had never applied any to Mencra. Toogood, and the seed sold by them was inferior to his. He claimed that there had been an infringement of his trade-mark, and that when a personal name was put to a seed it was supposed to be grown by that perion. He would not owear as to the cautom of the trade, bat only as to Kale. After formal evidence of purchase, it was agreed to adjourn the cave until September 11, counsel stating that the case was so important that it might go to the Hoase of Lords. It was intimated there was a perfect defence, and that the defendanta had only followed the cuitom of the trade. Times.

## LOW'S GROUND-COMPASSES.

As the ground season will soon be apon as, when many will be basy renovating old and laying out new gardena, permit me to direct the attention of your readers to thic usefal patent of Mr. Low, for many yeara the gardener to the Dake of Grafton at Eanton Park. In this position Mr. Low has had much experience, not only in the farnishing of the flower-gardeas, but has likewise had mach practice in remodelling and making the major portion of them on new and more gracefal linen. The character of the garden, at well ac of the manaion, almont necesuitated formal or geometrical treatment, and all who have had any experience in anch work know what material help may be derived in the laying-out of flower-beds and borders from reliable compasses 4 feet long with a radius of 6 feet to 6 inches or less. Than necessity as uenal became the mother of this most usefal invention, which I have found to do readily and well all the work promised for it, and more than in promised in Mr. Low's prospectus. They are saperior to any others I have used for landecape-work, in their neatness, fixity, certainty, and durability. As seen at a glance by the woodeat (6g. 45, p. 219), the staff shows the patent compases at rest, posing or reposing. A sight-staff for the forming of perpendicalara, b, shows them at work with the left leg reating on a solid base, and the right fixed to any given radian by the slender connectiograil, secared in position through the small thambcerew on the opposite or dencribing leg; the compasees aloo secure fixity of depth and certainty of rudiuf. The square block, pushed into the ground, with its brass-furnished hole, for the atable leg, secariag the first, and the connecting-ppline and thamb-acrew the necond. What these two conditions are, and how much they mean, can only be thoroughly underatood by thoue who have had to lay out difficult and delicate denigue with common companses.

As to darability, both lege are shod with branf, and the wood is of the beat, and thoroughly seamoned. For setting out small holdings, allotments of frait, flower, or vegetable gardens, walkp, measuring the distances between frait trees and bushes, or other crops, setting out amalle, thene compasses form the handiest of all measuring-rod. D. T. F.

## SOCIETIES.

## ROFAL HORTICULTURAL.

 Scientific Committee.Avgost 13 -Present: Dr, M. T. Msuters, in the chair; with M-. MeLechlan, Mr. Bayber, in tha
Weathere, and Kat. G. H-ailow, Hon. Sec.

Black Currant $\times$ Gooseberry, $-A$ fruiting specimen of this hybrid was sent by Mr. CuLFERWELL. It was previously received and described in the minnutes of the Scientifc a very
mittee for Jone, 1890 . The fruits are emall, and have a very mittee for Jone, 1890. The fruits are email, and have a very slight tate of the Black Currant, The bark reveals thlancular
more distinctly, while the skin of the fruit has the glandula more distinctly, while the skin of the fruit has the glandular
hairs of the latter mixed with the ordinary hairs of the Gooseberry.
Lilies Diseased.-Specimens of the foliage of L. Lowi and L. nepalense were received from Messrs. W LlLace, of Col cheoter, attac ked by apparently the too common "Lily disease"
fungus. Bordeaur Mixture is suggested as the best remody fungus. Bordeaux Mixture is suggested as the best remody. He observed that the disease in his garden only attacks the
Lilies received from Burmab. It was formerly thought that burning was the only means of extermination; but experience bas shown that the bulbs may not be at all injured, and that as the disease may be very prevalent one year and very scarce the next, it will be better in future to
destroying the aerial portions attacked.
Lime and Bees.-A spray of a Lime tree was received from Mr. F. EMock of 21, Manor Gardens, Hollovay, to be named. It proved to be Tilia petiolaris, D.C. He also observed that numerous dead bees were found under the tree, suggesting that the honey might be of a poisonous nature. In a com munication from Kew, whither the specimen had been sent, it is observed:- "We have long noticed at Kew that bees are lilled after visiting the flowers, and quite a circle of dead bodies are found under the branches every summer." Mr. McLacslan remarked that this occurrence has been long Knowa to entomologists, and by the watching of the trees by Mr. E. Saunders he found that the death of the bees was caused by the
Lettuces attacked by Aphides.-Plants received from the Chiswick Gardens showed the roots to be badly infested by these insects. They were
for further eramination.

Potatos Diseased.-A communication was received from Mr. Ashley, Elmeroft, Staines, stating that "the leaves appear to be spotted with brown, where holes appear; the leaves subsequently curl up. The disease occurs in patches, and gradually epreads. It is not confined to one sort of Potato alone. I noticed the same disease on some early Potatios about two months ago, and washed the leaves with very weak paraffin and water. TThis seemed to stop it."
Having been forwarded to Kew for examination, the report is as follows:-"The young leaves are in the first instance punctured by an insect; the wounds made are the points afterwarde attacked by a microscopic faugus-Macrosporium Solani-which completely destroys the tissue, hence the holes in the leaves. Spraying with Bordeeux Mixture will destroy both insect and fungus; but if a solution of very weak paraffin has proved effectual it woull be wise to continue its use The great point in spraying, whatever solution is used, is to thoroughly wet toe lesves., A little soft-soap mixed with the liquid assists in doing this.
Weataers exhibited Deodara Struck by Lightning. - Mr August 12. It represented a Deodara which was shattered by lightning on the night of August 10. The main trunk is cleft in twain almost to the base, while large splinters and branches are scattered abjut. The wood is perfectly sound, and shows no signs of charring. The tree was abjut 30 feet tn height.
Custanea vescx, Female replacing Male Flowers. - Me. HENSLOW exhibited specimens of this exchange of sex, as
being particularly abundant on a Cnestaut-tree this season; a probable result of the climate, as it is well known that external conditions often decide which sex shall pedominate when a plant is naturally bi-semual. He alluded to experiments by Mr. Meehan, Hoffama, and his Own, in which seeds of bi-sexual plants gave rise to various proportions of males and femkles, according as they are sown very thickly or thinly.

## Fruit Committee.

Adgust 16-Present, at Chiawick, were H. Bisderaon, Eiq., in the chair; and Menart. J. Willard, G. Wythen, J. Hadson, Mr. Fife, A. Dean, W. Farr, J. Chenl, and J. Sxith. The committee's attention was first drawn to the Tomatos in pote, of which there is in various houses a very large and well-grown collection; very few, however, are really new, and none seemed to show anything apecislly meritorious beyond what can be aeen on eatablished varieties. The following had pravious awarde of three marks or of certificates, granted at the Drill Hall, confirmed:-
Golden Princess, fine deep galden fruits, very handsome and prolific; Temis Bul, fruits freely produced in grod clustera, medium-size, round, rich colour, and pretty; Comet, large, handsome, smooth, rouad red iruits; Sutton's Dessert, smallish fruite, borne in clustera, scaclat; and sutton' Golden Nuggat. a counterpart of the previous one, fruite rich yellow, buth abuadant fruiters as dessert variesies; Fragmore selected, a large hindsome free-fruiting variety, searlet colour; Duke of York, recentily certifi ated at the Drill Hall, also having fine scarlet fruits; Chemin, a will-mowa scarlet-fruitel variety, and the bstter known Conference. Two sorts not previounly noted, were Sutton's Early Jaly, an improved open-air, and the cherry-bhaped, a very old sort, fruit sca sh, round, scarlot, and borne in raserses, specially mentioned for its high flavour a deseert variety. Each had three marka awarded.
Rumner Beans next came under notice, those of British stock boing generally excellent; whilst Continental varie-
ties seem to have suffered from the cold rains. of the Scarlet or rough Ranner types, Sutton's Prize-winner, splendid long green Bean; Sutton's A.l, also good; Leviathan Capp's White Runner, a fine and very prolific white flowered variety, had each three marks awarded. Of smooth rumens the only ones regarded as worthy of special notice were Sutton's Tender-end-True, and Veitch's Climbing French Beans, previous awards being confirmed; the committee, however, seeing these two Beans growing here together under precisely aimilar conditions, came to the important conclusion that they are absolutely identical, they all the same leave to others to determine under which of the above names the rariety shall henceforth be recognised.
The adjoining trial of Cabbages was then inspected, there being a first-rate growth on all. Of the dwarf early varieties, the best stocks were Improved Nonpareil, from Messps,
Nutting \& Sons, and Messrs. J. Veitce \& Sons, both of which received three mark3. A better dwarf Cabbage could hardly be found anywhere. Of succession varieties, the best were Sutton's Earliest, Barr's B sat of All, Vilmorin's Express, and Les Etampes, all of which the committee reparded as of the same stock, and a first-rate one. This is probably the best mid-season Cabbage in cultivation.

Red Cabbages were also noted, the stocks of Benary, Vilmorin, and Sutton's Dwarf being the best, also very dwat, early, and compact. A final deoision as to the merits of these
will be given at a later meeting, when the Potatos will have to be examined. Of these there is a large trial, but, like Potatos everywhere, the growth is excessively strong. $A$ few early Turnips ware also examined, but were regarded as of no special merit

## CHARLWOOD AND DISTRICT Horticultural

Augus 7.-Charlwood in a village lying near to Crawley, on the vergy of the boundary of Sarrey and Sussex, and near to the frait nurseries of Mesmr. Cheal \& Sonn. For several years past a mall cottagers' show has been held, this year it took the form of a district show, extending its operations over a wider range, and prize were offered for the firt time for gentlemen's gardeners' competition. So good was the exhibition that it promises well for the future, and with Mr. Joseph Cheal as general director, there is a aseful futare opraing betore the Society. A large number of counary people came to see it, despite the threatening weather.
Tables of plante, occupying a space of 12 feet superficiala faature obviously copied from the Brighton shows-were an excellent feature. Mr. Thos. Spapkes, gro to A. A. Dorotr, Esq.. taking the 18t prize; the and going to Mr. Daney, gr. to means of education for young gardeners. Some useful table planto were shown. Mr. Davis, gr. to J. Covelle Esqu, talking the 1st prize, though all shown were rather too large; he also had the leading prize for six quarter-spocimen Ferns, well-grown, and very healthy. One often sees in country districts something of exceptional quality, and it was the case in the class for aix Coleus in which spacial prizes were offered by the grown and coloured bushes of distinct varieties, that were a great deal better than anything we saw at Leicester on the previous day ; some rather larger plants, also well grown, cook the 2 nd prize, but the exbibitor's name did not transpire. Mr. N. Tanner, ge. to Mrs. Brougetur Stirling. Lovall Heath Lodge, had six very good double fiswered Begoniser which took the lit prize. Plants were also shown by amateuri. Cut flowers formed a stronk point. With twelve varieties, Mr. K. Brown, gr. to M. W. Morris, Esq a young gardenef who promises well as an exhibitor, had African Marigidds, Chrysanthemums, Coreopsis coroasta, Picotees, Bugonias, \&c.. all in good character; Mr. Davis was placed 2ad.
The special prizes offered by C. G. Sloane, Ext , for twelre bunches of Cactus and decorative Dahlias bevught a good competition, and MP. E. Brows, who has already made hit mast at the Orystal Pdace Dablia show, was placsd lot with escol lent blooms of Delicata, Gloriosa, Mrs. Peart, Lady Penzace: R. Cannell, Mistchless, Borth 3 Mswley, Juarezii, \&ef, ; Mr. 6 Dasce came ind, haviag rather more of the decorativa varieties. With sis buaches Me. Brown was agaia 18t, haviak in good charactar Mrs. Douglas, Matchles3, R. Cannell, Lsd Penzanco, Delicata, and Besuty of Wilts; Mp. Dancy wim 2nd, his best bunches being R. Cannell, Bertha Mawley, Min Peart, and Keynerith.
Asters were ssoce what sparingly rapresentsd, the westbet having told upon the blooms.
Fruit was invitod by apecial prizes from Mra. Bhot gitor Stirking: for sir dishes, Mr. Davis taking the 1st prize with Blact Grapes, Peaches, Pluns, Melons, \&c. Mr. DAv hat the bast two buaches of Black Gripes; Mr. Sparis 2ad. Me, Daxcy had a very fine lot of twalve Tountoen Davis was p'aced 2nd.
That vegetables are well gro wa bereaboate was conclusivil ehown in the high quality of not a few which were stagein Mr. Browir took the lst in Measro. CeEeal \& Sor's sped he prizes for six dishes of vegetables of their own stock, and and had very fine Cauliflowers, Carrots, Potat
Scarlet Runners ; Mr. Sp4Rks was 2nd.
carlet Runners: Mr. Spaliks was 2ad.
G. O. M. Herrox, Req. also offored special pries Mor dishos, sho wa by amateues. Mr. PETERS was 1st, and Mo Greenfield 2nd.
In the amateurs division, Mr. W. Greevfieco walst with a plate of Potatos, and also with aix varieties of fruit.

In the way of miscellaneous exhibits, Messrs. J. Cheal \& Sos pat up a large collection of hardy cut flowers, pretty Violas in bunches, Cactuz, Pompon and single Dahlias, Gladioli, \&:, with Begonias in pots, Palma and Ferns at the Gladioli, $\mathbb{\prime}$,', with Begonias in pots, Palma and Ferns at the
back, a very fine feature. Mr. F. Frank Hudson, Gunback, a very fine feature. Mr. F. FRaNk HuDSOX, Gun-
nersbury House, set up three charming Epergues, arranged nersbury House, set up three charming Epergues, arranged
with fine good taste, some of the new hardy water Lilies with fine good taste, some of the new hardy water Lilias
from America being specially attractive; and Mr. Spinks, florist, Horley, had a collection of cut blooms of various types of cut Dahlias, all of which were highly commended.

## STOEE POGES FLOWER SHOW

Adgust 7.-This show was beld in the grounde of H. Howard-Vjse, Esq. Stoke Piace, near Slough, on the above date. Tae horticultaral society of this place was started in quite a mall way, but it has now attained considerable importance. On thin occaion the groups of plants arranged for effect were very good, and with a few other exhibits, filled a large tent.
The groups were of semi circular form, to cover 10 feet square, and tre 1st p:ize was well won by Mr. Page, gr. to H. Howard-V yse, Esi. ; he had a centre Palm, a Kentia, with beatifully-coloured Crotons and Eulalias, Francoa ramosa, Oncidiuna flexuosum, and Lilies, with a groundwork of Adiantum and Caladium argerites. Mr. E. Johnson, gro to A. Gililit, Esq., was a gooi 2nd; and he had some very fine White Campanulas, in his group, good Glorinias and Lilies, and Francos ramosa, with a ground worl of Midenhair, edged with Panicum variegatum. 3rd, Mr. Capp, gro to Sir C. Piggott, Wexham Park, whose plants were good, but the arrangement rather heavy.
For six kinds of fruit, Mr. Jounsor was 1st; and in the For six kinds of fruit, Mr. Jounsor was 1st; and in the
vegetable classes this exhibitor held the same position both for vegetable classes this exht and six kinds. with splendid produce.
Mr. Kemp, gr. to W. Bryant, Raq., Stoke Park, arranged a fine group of plants, not for competition, his Pancratiums being especially fine; and Mr. TURNER, Slough, had a good display of cat Roses and herbaceous flowers.

## SEVENOAK8 HORTICULTURAL.

August 7. - The twenty-eighth show of this society was held in favourable weather on the above date in Knole Park, and was of the usaal character, nothing apparently being of especial merit or out of the ordinary ran.
There were plant-groups in which Mr. Gibson, gardener at Halstead Place, was the winner of the 1st prize; a specimenplant class with Mr. Sutton, gardoner at Chevening Park, as the best man; Mr. Hastron took the lead in a miscellaneous collection of plants, and one of Ferns.
Roses, Asters, cut flowers of the stove, greenhouse, and open border were shown. Mr. Snow was the lucky exhibitor of the best six dishes of fuut in as many kinds; and Mr. Tayleen, of Forest Hill, S.E., had the finest Black Grapes; and Mr. Osman, Chertsey, the best white ones.
Vegetables, table decorations, \&c., and special prizes, including Messrs. H. Cannell \& Sows" "Star of Honour" for the cluding Messrs. H. CANNELL SoNs' "Star of Honour" for the
beat twelve distinct dishes of Vegetables, and a box of cut beat twelve distinct dishes of Vegetables, and a flowers, was won by Mr. R. EDWA
complete the more important exhitits.

## WILTS HORTICULTURAL.

Adaust 14 - With fine weather, and in the place for holding the show, the Wilta Horticaltaral Society's annual exhibition was enpecially favoured this year. The site of the show was located in the ground of the Bishop's Palace at Salisbary ; and the Committee and the Hon. Secretary, Mr. C. G. Wyatt, are to be congratalated upon the well-merited maccen attending the thow.
As usual, Mr. OyPEER secured the higher awards, including that for twelve atove and greenhouse plants. His very fine plants consisted of Stephanotis floribunda, Ixora Williamsii, Erica Austiniana, Clerodendron Thomsonianum var. Balfourii, Statice profusa, Phueuocoma prolifera Barnesii, two grandlyflowered plants; Codireums Sunset and angustifolium, beautifully coloured: Kentias Fosteriana and australie, Cycas circinalis, and Latania borbonica. Mr. Thomas Wilkins, gr. to Lady Tezodora Gurst, Inwood House, Henstridge, and Mr. Wilis, Shirley, securing 2nd and 3rd prizes respectively.
The 1st and 2nd prizes for nine stove and greenhouse plants, five to be foliage and four in bloom, went to Mr. W. Peel, gro. to Miss Todd, Shirley, and Mr. Wilhs; Codiwum Queen Victoria and C. Johannis, Kentia Fosteriana, and Izora Williamsii bsing the more noteworthy exhibits.
The competition between Mr. WILKINs and Mr. Hall, gr. to Loursa Lady ashburtur, Melchet Court, Romsey, in the class for six distinct exotic Feras, was severe, the prives, after a considerable amount of time had been spent conबidering the plants and the awards to be made, were at last given in the order in which wa place the names. Divallia fijiensis plumosa, D. Mooreana, and Adiantuma cuseatum were the beat in Mr. Winkins' lot.
Six Tubsrous-rooted Begonias, shown by Mr. A. Bobey, gr. to Captain H. Greevwood. Haraham Clift, Salisbury, wert a long way in adrasce of those ataged in that class, this being the sixth year in suecesmion that Mr. Robey's Begonias have
taken 1st prize at the Wilts Horticultural Society's Show These plants consisted of well-grown and finely-flowered double and single-flowered varieties, the foliage being ample, and the flowers large and fine in every respect. Mr. BEDFORD Harnham Nurseries, Salisbury, came into the 2nd place with Harnham Nurseries, Salisbury, came into the 2nd place wit
fairly gooi plants. The last-mentioned ezhibitor was far in fairly gooi plants. The last-mentioner exhibitor was far in
advance of other competitors in the class for six Fuchsias, advance of other competitors in the class for six Fuchsias,
staging sized pyramidally-trained plants, fresh-looking, in staging sized pyramidally-trained plan
regard to the foliage, and well-flowered.
Groups of miscellaneous plants, arranged fse effect, form an important feature in most shows of any standing. The groups arranged this year at Salisbury fairly eclipsed all previous endeavours in this direction; they were light, and quite devoid of formality in most cases. Of the groups arranged in the open and gentlemen's gardeners' classes central plants consisted of Palms, backed up with maller ones-Codirams, Dracenns, Tuberoser, Bridal Wreath, Francoa ramosa, Caladium argyrites, Cattleyas, Oncidium incurvum, ec., being advantageously employed in most of the winning groups, on a groundwork of Maidenhair Fern, the whole being. as a rule, edged with Panicum variegatum, and small piants of Maidenhair Ferns; plants of irregular heights arranged with telling effect by Mr. Wills: Mr. Carr, gro to W. A. GIllett, Esq., Bishopstoke; and Mr. A. Rober, in the open class, and by Mr. Cabr, Mr. Peelo and Mr. Rober, in the gentlemen's gardeners' class, and (wh) took the prizes

Fig. 45.-Low's ground COMPASSES. (SEE P. 218.)
in the order in which their names appear in both of the classes. Mr. Bedrond had also creditable groups, which in both classes covered a semicircle of 14 feet radius. A nice flowering plant of Dendrobium formosum giganteuu ahowed off to advantage in Mr. Robey's group.
In the priacipal clase confined to amateurs, Mr. Pearce. High Street, Salinbury, won the Fiveguinea Cup given by the Mayo: of Salisbury, in a fiirly g od competition; the plants arranged in a semicircle of 10 feet radius, had been carefully selected and judiciously arranged. Mr. Scammell, gr. to G. R. Kendal, Eaq, Witton, tool let place in a smaller group class.

## Fbuts.

On the whole, fruit made a good show. Mr. H. W. WABD Longford Castle, Salisbury, secured the let place for a colleo tion of eight kinds, with goal full bunches of Mradresfield Court and Mascat of Alesandris Crapes, good in berry, and of exoellent colour; Hero of Lockingo Melon, Prince of Wales Peach, fine in size and colour; Brunswick Figa, Apricots. Ceapp, Farourto Peap and medium lized Pitmaston Orange Clapp's Favounto Peap, and medium-bized Pitmaston
Nectarine. Mr. Inglefield, gr. to Sir Joikw Kexa, Barto, Tedworth, Marlborounh, 2nd, had very fine Late Admirable Peaches. worth, Mariborough, 2ad, had very fine Lize Adminabie of Black Pine-apple Nectarives, and medium-sized bunches of Black Pine apples were not extensively shown, Messpr. W 1 RD and Hall taking 1st and and prizes in the order of their names. the former showiag a good-sinad fruit of 8mooth-lesved Cayenne, and the lacter s medium-sized fruit of the Queen. Grapes, especially Black Hamburghs, were well represented. Three large solid bunches of Muscat of alexaddria from Longford, fine in berry and colour, easily secured the 1st place. Black Hamburgh Grapes that were grod in buncts, berry, nd finieh, gained lst poaitiou for Mro J. Chall. gr. to G.

READ, Esq., Weatwood, Ealisbury, and he was elowely followed by Mr. Mitchell, Chilwell Manor, Romsey, who had budchen slightly smaller, but more compact, otherwise fin in all M.dre

Mudresfield Court Grapes were excellently shown by Mr. Smith, gro. The Palace, Salisbury; by Mr. Ward, and Mr, Warden, gr. to Sir F. H. Batilt Rist, Bart., Clarendon Park, Salisbuy. Three bunches of Mrs. Pearson, of fine size and
handsome outline, but requiring a month or air weeks to make perfect, secured the lot place for Mr. Gardener, kr. to Col. H. S. Bates, Twford, Winchester, in the chass for any other white Grape than Buckland $\$$ weetwater and Foster's Seedling.
Plums made a good class. A dozen fine fruits of Guthrie's Late Gage, perfectly ripe, ahowa by Mr. W $\angle R D$, took lst prize, while grand fruits of Late Admirable Peach gained a like distinction for Mr. Inglefiekd ; and a dísh of Elruge Neotarines, staged by Mr. Solmar, Pyt House, Lisbury, gained a similar a ward.
Apples were well represented. W. Falford, gr. to Karl Nelsoy, Trafalgar Park, Salisbury, who was lut for thre
dishes of dessert varieties, atagiog grandly coloured fruits of Beauty of Bath. Early Harvest, and Red ABtrachan; while fine fruits of The Queen, Toddington Seedling, and Lord Suffield gained chief honours for Mr. Smity.
Collections of Vegetables, consisting of twelvo linds, made a good show. Mr. Wilkins was list for an admirable collec tion. Mr. R. West, Northlands, Salisbury, was the most successful exhibitor in the cut flower classe8, which for the most part were well filled with generally first-rate exhibits. Non-competitive Exh:bits were contributed by Memrs, Keynes \& Co., who arranged a grand lot of Dahlias, \&ce. Mr. LADEAMs, Shirley, had a collection of herbaceous Howers Mr. Bedford had miccellaueous plants.

## BISHOP'S STORTFORD HORTICOL TURAT

August 14.-The annual exhibition of this Society was held in the grounde of the Grange, Binhop's Siortford, by permiseion of J. Barker, Enq. The schedule is a very comprehensive one, the classe were well filled, and the gronpa of planta here, an elsewhere, formed an interesting feature. Altogether it was an excellent show.
There were five groups, and tha best was from the gardens of Sir Jas. Blytir, Batt., Wood HJuse, Stansted ( $\mathrm{g} \%$, Mr.
J. Richardson); cJntpicuout as a back ground to the group of Adiantums. Group; of siagle and doable-flowered Begonias are always a nice festura at this show, and one tent was set apart for them.
C. Gold, Eaq. Jan. (gro, Mr. D. Patmura), was lat ; and W. Smite, Esq. (gr., Mr. R. W. Kent), 2nd. Other classes were aet apart for Bagoaias in bloom, Mr. D. Patarobe winning mostiof the prizes. Of the four groups of six foliage plants, the best one cams from sir JıMres BLyTE's gurden. The the best one came from sir of six Ferns were from the gardeas of Colozel $\mathbf{G}$. $\mathbb{B}$. ARCEE \& Houblow, J.P. (groo Mr. B. Calvert). The beat ARCHES Houblozizos, fine in size of bloom wape from W. Holland, Esq.o Plantation House (gro, Mr. W. A. Duanage).
The best siogle and doable zoasl Pelargoniums were from U. TAYLor, Esq., and were handsone, well-grown specionens. Mr. D. Pataoge exhibite well.grown Fachsias. The groups of autuma-floweriog Chrysanthemums deserved a specia! notice. Tae wioning collestion consisted of fice dwarf plants, with large and handsocae flowers. Mr. B. Calvert was 2nd, with a ve:y commendab.e lot. Ia the Rev. J. Menet's collection (ge., Mr. T. Lodge), the varieties were Madama Desgranges and its yellow and primeose sport.
Table decorations were of the usual standard of excellence. No fewer than twents-six tables were set out in competition for one set of prizes. Miss Jessie Canying wou the lst prize with an arraugement of Poppies, a few spikes of Gladiolus The Bride, with fmall flowers of a siagle variety of Helianthue; 2 ;d, Miss Bailey, with an arrangement consisting entirely of monthly Roses; 3rd, Mrs. Rourlisder with a table of $S$ weet Peas.

Fruit, etc.
The bast black Grapes ware from the garden of Colonel Arceer Houblow: and the bess white from those of Sir James Blyte, Bart. Colonel Arcier Houbloy's gr. had also the best collection of fruit; and Sir James Blyte's gr. the hest Pesches. Tue best Nectarines were from sir Javes Blytidy garden. Apples, Pears, Plums, Cherries, and small fruits were generally fine fruits in overy point. though some wase not ripe.
Quantities of cut flowers were exhibited, eepscially fine beiog Phox Drummondii, from E. H. Warrs, Euq.'s estrden; sionle and double Zunal Pelargoniam traswes were very creditible, the beat were from C. GoLd. Exq., who also had aplendid French Marigolds, but even these were surpassed by wonderful Africsa Marigolde. Phlozes, Asters, Hollyhocks, Violas, Roses, and other flowers were very attractive.
Collections of vegetables.-Salads, Tomator, \&c., were very fine, showing that the gardens at Bishop's Stortford are not one whit behind their brethrea in the county of Kent.
The cottagers' produce filled a good-sized tent, and was well worth clons inspection, Potatos, Carrots, Peas, Beans, \& \& ., were abuodantly and well exhibited,
Mesars. Vertce of Chelsen exhibited a group of choice plants, in which $\mathrm{D} \pm \mathrm{ad}$ robium Dearei, and the distinct-colarred D. giomeratun were conspicuous; Mr. Rumgey of Waltham Crose had fiae Roses; and Messts. Paul \& Sox of the Old Narseries, choice herbacs, us placts.

## WESTON-SUPER-MARE.

Avgest 15.-The Waton-anper-Mare and Ext Somerset Horticultaral Society held its eighteeath annual thow of plants, fraits, flowers, and vegetables, in the Grove Park and Glebe Field, on the abovementioned date. The exhibition was, on the whote, a good representative one, and redounded to the credit of the Honorary Secretaries, Measra. Thomas \& Webb, and the inhabitants of this pretty sea-side resort.

## Plants.

In this section Mr. J. CTpres's plants formed the chief attrection, and secured for the vetoran cultivator six lat prizes in the reapective clastes for twelve stove and greenhouse
plants, in as many varieties, six flowering plants, and six plants, in as many varieties, six flowering plants, and bix toliage plants, distinct varieties to be shown in each case.
Specimen foliage (etove), and specimen flowering (greenhouse). Specimen foliage (otove), and specimen flowering (greenhouse). and for the best spe imenergrown and finely-coloured plant of Codiseam Roidit. The more or less prominent plants in Mr. Cxpier's exhibits were Kentias Fosteriana and Belmoreana; Intanta bosbonica, Codiseums Queen Victoria and San. ret; Stephanotis floribanda, Bougainvillsa Sanderi, and Izora Pilgrimii (iacluded in the twelve stove and greenhouse exhibit), Erica oblsta purpurea, E. Marnockiana, Rondeletia speciosa, and Clerodendron Thompoonianum var. Balfouri, being the most conspicuous among his six flowering plants; while the most prominent in the half-dozen foliage plants were repressonted by good apecimens of Codiseum Johannis, of fine size and good colour; C. Baron Rothschild. Cycas revoluta, and Latania borboaica. Next to Mr. Crpier came Mr. W. Rewland, gr. to W. Brock. Esq. Parker's Well Hou'e, Exet-r. a succeseful exhibitor in the plant classes, who beat Mr. Cxphes in the class for a sp
plant, whe Stephanotis floribunda.
FRUTT formel an important far'ure in the show, the twenty classes devoted to it ceiog pretty well contested, and the exhibite genemlly were of great merit. Mr. H. W. Ward, gr. to the Eirl of Radnor, Longford Castle, Salisbury, being the most successful exhibitor, he taking six lata (for collection of most uuccessful exhibitor, he kinds, viz., Pineapple. Madresfield Court Grapee, eight kinde, viz., a Pineapple, Madresfield Court Grapeo,
Peaches. Figs, and Pears, Clapp's Favourite), and two 2ads, with excelleat all-round produce. Mr. Lloyd, Langport, and Mr. Crossman. Yeovil, were also succesaful competitors, and bith showed well. The awards wore not quite so satisfactory in the clasees for Black Hemburgh and Muscat o Alewandria Grapes as they were in other eighteen clasees.
Tue cut flowern and vegetables wore fairly woll pepresented, but the individand exbibits call for no apecial notice here, lurther toan to sey, that Mr. GABAWAY, Bath, took two 1sts, including one for a collection of eight hinds, and Mr. CrossMaN, four lats for vegetables. The Onions of the latter were
the finewt in the show, but they were, unfortunately, over the finemt in the sho
looked by the judgee.

## MAIDENHEAD.

Adgust 15.-The snnual exhibition, held on the above date, was in every sense an unqualified anccess. Although in a manner it is a local show, s much larger area is embraced than obtaing in most inatances. The competition throughout wae very keen. no fewer than twelvo competitcrs entering for the Merirs. Sutrusis prizes for collections of vegetables, and nine or ten for the large collection of frait, other clases ${ }^{\text {b }}$ being particularly well filled under these heads ; whilst for groups, there were ten entries in the two clases, and five for Taberous Begonias. This apeaks well for the enthusiasm displayed in horticaltare around Maidenhead, the Society being evidently a popular one with exhibitors. The execative deterve every anpport for the sdmirable manner in which the varied details are earried out.

## Flaxts, *c.

In the lerge group clas the competition was exceedingly keen between Mr. Aitken, gr, to Col. Mrexrme, and
Mr. Phillipe, wr. to H. Gown, Foq.. realting in an equal Mr. Phillipe, wr. to H. Gown, Feq-. revulting in an equal cahibita are rarely ever men, this boing largely mosounted for by the fact that the last-named gardener wan for some time ramose, Lulium lancifolium vars, and Campanula pramidal albu were to be seen in each, whilst in the firstwanad there were Pancratiums in addition, and fa the latter Celsia cretica. bth being emplayed to good offect; Well-coloured Crotons were very telling in each eases. Mr. Wood. gr. to Lord Bostox, Hedsor, followed in this clas with a bright group.
In the smaller group-class the competition was also leen,
Mr. Ereswell, gr. to A. Gold, Esq, being placed lat with a light and well-balanced exhibit; Mr. Riehardson, gr. to G. Heramige. Esq, who followed, had also a good group, very nesk to the first, the colours being well blended.
For twelve fine folisge planta in 8 -inch pots (a mont sensible and useful elasg) the competition was again Keen, Mr. AITKBM variety, Acalypha Macafeemeny plants in grod colour and Johennis, Ficus elnatica eemnos told well. as did Codiæum Mr. Gillies, fr, to Sir B wariegata, sed Diefionbachia Bausei. Mr. Gilfes, EF. to Sir B. G. Harvex, whe a mear 2nd, his best being Codireum Prince of Wales, very bright, Dreceens BiapCiati, and Cocon Wedelliams.
For six stove and greenhouse plonts.-M- AITEEX wat
eas Iy lst, his best being Allamanda Hendersoni, Clerodendron Balfouriaoum, and Codieum Queen Victorid. The last-named Was also lst for a specimea-plant in flower, with a beautiful men with Codirum Queen Victorid, an immense bush. Mr J. Smita. Clewer Nurseries, being a good 2nd in the former instance with Stephanotis floribunda, very fresh; and Mr. GILures in the lattor, with an enormous example of Alocasia gigantea.
gigantea.
Mr. Goodman, gro to Misa Hummersfey, was 1st with large, healthy, and well-flowered tuburous Begonias; and Mr. ricelardson 2nd, with plants nearly as gojd. Another good exhibit in this class of the choicest kinds, with large blooms, but the plants much
F. D. Lambert, Eeq. exhbit of gix Fuchaias, and was awarded the 1st prize, Mrs. Rundle and Charming being two of the beat.
From Mr. PHILLIPS came a grand half-dozen zonal Pelargoulums, the plauts quite a connterpart of each other iu bize s ze. The varieties were White Perfection, double; Mrs. Gordon, deep acarlet with white eye; Neila, deep pink; Hermia, deep cerise; Lady Chesterfield, bright salmon; and Uivia, dark cerise. The plants measured fully $4 \frac{1}{2}$ feet through. The best set of table plants were from Mr. AICKEN, dwarf, and in good character ; Mr. J. W. Richardson following.
Cockscombs, froca Mr. Hopkins, were very fresh and fully developed. The Gloxinias showa hy Mr. J. Fulford were well-flowered and fresh, the plants of med.um size. A class was provided for Streptecarpus, the first occasion oo which we have noted this introsuction; one collection only, and these but of medium merit, was sent oy Mr. C. Young.
The class for another favourite one, and some exceedingly bright and well-grown plants were staged, these being chiefly
tall pyramids, the best came from Mr. T. GRESWELL, who had tall pyramids, the best came from Mr. T. Greswell, wha had capital varieties.
Cus Fiowers. - This section is dividel into two distinct diviions, one for the trade only, and the other for private growers. In the former of these the best box of Roses, bright and fresh,
wat sent by Mr. F. J. Fletcerer, Lowbrook, Bray ; Mr. J. Wa, seat by Mr. F. J. Fletceer, Low
WHLEE, Thame, following a good 2nd.
With Dahlias, Mr. WALKER was lst, showing blooms quite up to exhibition standard, fresh and bright; in this instance Mr.J.R. Tranter was 2nd, he, too, showing well.
Zinnias are always showe well at this exhibition. Mr. Walker again winning, with Mr. Tranter 2ad; the positions being reversed for Anters, which were extra good

In the latter or amateur's division, the leset box of Roses came from Mise B. Destor, Winkfield; two other good stands being present from Mr. Paxtor and Mr. Fulford. Dahlias were scarcely enough advanced. Mr. MUNT, of Slough, had the best twelve show hinds, and Mr. H. Diddame, gr. to J. C. Wootron, Euq., the best dozen Cactus varieties. The Asters on the other hand in this division were remarkably good, several stands being put up. Mr. C. YOUNG was lst and Mr.
J. Hanch, gr. to J. B. Weatrer, Esq., 2nd. Zinnias were J. Hanch, gr. to J. B. Wrather, Esq., 2nd. Zinnias were
specially fine here, better than in the trade class, the two best stands being very close in point of merit. Mr. C. Mums, Windsor, wae 1st; and Mr.C. Yourg, 2nd.

## Eruit.

There was an abundant competition in this division, and the standard of excellence ruled very high, Mr. AIIKar was lst for six dishes, showing first rate Muscat Grapes, fine Royal George Peaches, Counteme Melon, and Lord Napier Nectarines. Mr. GOodmax came a close 2ad, but was weaker in Grapes, having, however, very fine Souvenir du Conglès Peare, Brown Turkey Figs, and Dagraar Peaches. Mr. Mowbray, gr. to Hon. H. C. LeGGE, also staged well for the 3rd prize.
For four dishes, there was also an abundant competition, Mr. D. Paxton being lat, Peaches, Nectarinea, and a good Melon being the best divhes. Mr. Y. Cole, gr, to Bir G. RUsselin, was well up for 2nd place.

With four dishes grown in the open air, Mr. D. Pixtor again won, showing fruit well ripened and of high colour, Brown Turkey Figs, Jefferson Plums, Strawberry Pippin Apple, and Moor Park Apricot being his choice. Mr. GoodMast, who followed closely again, had very fine Old Windeor Pears, and Red Astrachan Apples.
Black Hamburgh Grapes were a atrong clase, Mr. F. Core winning with large, well-coloured bunches, carrying a dense bloom: Mr. G. Hopkurs was 2ad, with smaller, but wellfiniehed bunchen.

Mr. F. Cons wou again with any other black, Alicante being his choce, the bunches again of extra size, with a dense blcom (Madresfield Court at this season is a decidedly better Grape in such a olaes) ; Mr. Oeman, ge. to S. J. B^ker, Eeq., was 2nd, he also showing a late Grape.
With Muscat of Alexandria, Mr. Mowseny won handsomely with very fine large tapering bunches, well ripened; Mr. F. COLE in this instance having to be content with ind place.
For any other white, Mr. Mowbray was again to the front with Foster's Seedling; the same kind from Mr, Goodman being 2nd. An exhibit of Mr. Pearsox in this clas was staged too late, otherwise it would have been a formidable one With six Peaches, Mr. Johnston, gr, to A. Griliat, Esq., Was lot. the variety being Bellegnrde, highly coloured; Mr. ATMEN taking 2nd with Royal George.
The best Nectannes were Hambolnt, shown by Mr. $\mathbf{H}_{\text {. }}$ CAWTR, KP, Ot Okley Court, handsome fruit; and the 2nd
best, Lord Napier, from Mr. Arkre best, Lord Napier, from Mr. AITLeM.
A strong competition in the class for one Melon, resulted in Mr. Goodmax being placed lat with Pine-apple; Mr. Jas, Woon was 2 nd , having Beauty of Sion.
The fine at Plums were a dish of Jeffernon, from Mr. Good.
man; whilst one of Kirke's. by Mr. Hopkins, was 2nd; both of these exhibits combined good appearance with quality. Dessert Apples were showu best by Mr. Goodmano who hat Red Astrachan, fully ripened; Mr. JoHNSM, was 2ad, with Culinary Apples were well advanced, the best being Pea good's Nonsuch, from Mr. Davis, gr. to H. ADAMs, E:q.; Iord Suffield, very good, was placed next in point of merit, from Mr. E. Johnstone.
Cherries (Morellos) were well shown, the 1ut prize going to
Mr. OSMAM ; and the 2nd to Mr. CAWTE.

## Vegetables.

Amongst several exhibits of Cucumbers, the best brace wn found in Royal Windsor from Mr. J. Wood; and the beat Onions in Ailsa Craig, from Mr. Goodman, whilst Perfection, as an exhibition variet
having the finest dish.
It was, howe dish.
Cotables where the the special class for a collection of vegotables where the greatest feature in this division was to
be seen, the prizes being offere 1 by Messrs. Sution \& Bors, Mr. G. Goodman won the list place in an highly creditable manner with good produce, staged effoctively, his casica being Autumn Mammoth Cauliflowers, large, but firm; Pe:fection Tomatos, good; new larga Intermediate Carrots, very clean ; Satisfaction Potatos, excellent samples; Lemon Roces Onions, large; and Autocrat Peas, a fine sample. Mr. G. Line, gr. to Miss Ridge, was very close for 2ad place, with similarly good ctoice ; and Mr. G. Worsfold, an excellent ${ }^{3}{ }^{2}$.
For the special prizes for six distinct kinds offered by Messrs. Webs \& Soxs in the next class, Mr. G. Storkit, Onions being his two best dishes; the bad staging of this exhibit detracted in a measure from its good appearance. Mr. D. Paxton was 2nd in this class with good dishes.
Messrs. J. Carter \& Sons also offered special prizes for sis dishes; here Mr. C. Young. gr. to Rev. J. Coney, was lat in another close competition (a few marks only separating the
1st and 2nd exhibits); his best dishes were Perfection lst and 2nd exhibits); his best dishes were Perfection
Tomatos, Ailaa Craig Onions, extra fiae; Autumn Mamaoth Cauliflower, Autocrat Peas, and Satisfaction Potat)s ; Mr. R. Cawte, who came 2nd, had a very even exhibit.
In other special vegetable classes, wherein the prizes were offered respectively by Mr. Broughron and Mr. W. H. Timp the two best lots were shown by Mr. R. HERBERT and Mr. J. Knight.
In a special class for tuberons Begonias, wherein the award was a Medal offered by Mr. R. Owen, the best exhibit cum from Mr. J. W. Richardsor, the plants dwarf and stocky.
Table Decorations, \&c. -The best set of decorations wa pat up by Mry. Herring Dropmore Gardens, very light and artistic; the 2nd best by Mrs. Becketr, in which harily enough material had been employed.
Mrs. BhougTon was 1st with a bonquet, the arrangement ercellent. The beat aingle epergne was that arranged by Mrs. Thompson
Miscellaneous exhibits came from Messrs. J. Laing \& \$ons, Begonias and plants; Mr. Fletcher, fruit and flowers; Mr. Such, cut flowers ; Mr. Fhippen, wreaths, \&c., very tasieful arrangements; Mr. Brovertow, plants and flowers; and Mr. Chas. Turner, Dahlias and Roses, a First-class Cenifo cate being awarded to Cactus Dahlia Beatrice, of very distinet colour, a deep pink. J. $H$.

## TROWBRIDGE HORTICULTURAL AND

 FLORAL.August 21.-This was the forty-nixth annus exhibition of what is probably the oldeet hortical. tural society in the west of England-one which for nearly hall a century has held an annual extibition at Trowbridge. It was, as unal, held in the townit field adjoining the railway atation. Owing to the season, the show displayed a little falling-off in a few respects ; the Fachaias were neither so numervou nor fine ae posaible, but any deficit in this respeci was compensated for in the clastes for stove and greenhones plants, which were very fine; the Begonias also, the collections of Ferns,
frait and vegetables were very good iadeed.

Plants, \&C.
In the open-to-all division, the best nise store and areere house plants in flower came from Mr. H. Matthew, ${ }^{\text {fo }}$ Sir W. R. Brown, Bart., Trowbridge, who had very examples of Ixopa coccinea and Pilgrimii, Allamandas alegan dersoni and nobilis, Ericas Austinasna, Ewerians, and retorta major: Dipladenia amabilis, and kod W. P. apeciooa major. 2nd, Mr. G. Tucluer, gr. to Major ditcos Chark, Trowbridge, whose best plants were Allszandarial Stephanotia floribunds, and Erica Turnbulli.

In the amateurs' clase for sir specimens, Mr. H. Martirwim was again lot, having very good examples of Diplodenis Brearleyana and amoena, Stephanotia floribunda, and, yrt Go nobilis, Ixora amabiliz, and Erica Turnbulli; 2nd ally Tuceer, his leading plants being B
manda nobilis, and Statice profusa.

With three plants, Mr. Tucker came 1st, having Lappassitis rosea, a the piece of Eucharis amnzonica, and Ronder Bon speciosa major; Mr. Pocock,
Trowbridge, was 2nd.
We have said there was a falling off in Fuchinan with some have said there was a falling off in rucrulind bin
bect six specimens; they were dark varietiee, Doge's Favouite, very fine-a grand old variety. Final, and Charming light, Arabella, Marginata, and Harriet Lye. Mr. H Pocock was 2nd
With four plants, Mr. Tucker was again lst, having Final,
Bountiful, and Charming, durz; and Arabella, light. Mr. 4. Pocock was again 2nd.

The best apocimen plant was a finely-grown and bloomed Allamanda Hendersoni, from Mr. \&. Bishop, gr. to F. APpleatE, Efq., Bradford-on-Avon; Mr. H. MstTREWS coming and, with a piece of Vanda coerulea, having eight or so fine flowers.
The best six Achimenes, nicely grown and bloomed, came from Mr. G. Pgmmo gro, to Mrso Gouldsmith, Trowbridge: Mr. Tuoker was 2nd. With six Gloziniae, Mr. Tucker was
det and Mr, O. Richman, gr. to G. L. Palmer, Ebq., Trowret ; and Mr. O. Richman, gr. to G. L. Palmer, keq., Trow-
bridge, 3 nd . Begonias made a fine feature, with six plants of bridge, $3 \mathrm{nd}$. . Begonias made a fine feature, with sir plants of
singlo, Mf. G. TUCKER was IBt; and MF. G. PYMM, 2nd. With six doubleflo wered varieties, Mr. C. Richman was placed 1st, having really £uperb specimens, finely grown and bloomed.
The best group of plants to fill a space of 50 superficial feet came from Mr. G. PyMM, arranged'with remarkably'good taste; Crotons, Liliee, Orchids, and other flowering plants made up charming arrangement, with a mixture of foliaged subjects; Mr. A. Strugnell,
Ashton, was 2nd.
some excellent specimens of zonsl Pelargoniums werestaged some excellent specimens of zonal Pelargoniums werestaged by Mr . $\boldsymbol{Q}$. TUCRER, and others; they
remarkably well shown by cottagers.
remarkably well shown by cottagers.
Mr. G. PYMM had the best four Orchids; the genus Pha? opsis was well represented.
The best new plant was Cypripe lium Cbamberlainianum, from Mr. H. Matthews; Mr. C. Richans being 2nd with C. Charlesworthii; a nice plant of Browallia speciosa major was also shown.
Of foliaged plants, the best mine came from Mr. H. MaTTHEWs, who had very good specimens of Crotons Weismanni, Reidii, and Baron James de Rothschild, Pandanus Veitohii, Asparagus plumosus, Dracsena Cowperi, and others; Mr. G. PrMM came 2nd, his leading plants being Oroton mirabilis, Acalypha tricolor, and Cissus discolor.
The best fifteen epecimens of Ferns and mones came from Me, Geo. Tucker, who bad excellent examples of Gymnogramma sulphurea and G. peruviana argyrophylla, Adiantums concinnum, peruvianum and gracillimum, Dicksoaia miarctica, Gloichenis rupestris. Davallia Mooreana, and Selagivella Wildenovi, 2nd, Mr. H. Pocock, whose best specimens were Alsophila excelsa, Ggmnogramma chrysophylla, Ad
Coleus are always well grownat Trowbridge, the best six came from Mr. H. Matthews, who had in very fine character, Mra. C. Hart, Lady Dacre, Beckwith's Gem, and Mrs. Sheriff. 2dd, Mr. Jas. Hiscox, Ere $^{2}$ to E. B. Rodway, Rsq., Trowbridge.
Out Flowers were, as usual, a strong point, Roses taking the lead. With twelve trebles Mr. J. Mattock, narseryman, Oxford, was lst, having excellent blooms of Ernest Metz, Souvenir d'Elise Vardon, Mrs. J. Laing, Hon. Eaith Gifford, Catherine Mermet, The Bride, and Charle Lefebvre, with others. 2nd, Messri. Geo. Cooling \& Sons, nurserymen, Bath, also with good blooms.
With twenty-four varietiea, Messrs. J. TOWNSEND \& Ions, nurserymen, Worcester, were lst, having capital examples of Urich Brunner, Fisher Holmes, Devonienais, Mrs. J. Laing, Madame de Watterille, François Krager, Lady Sheffield, and Duke of Edinburgh: Dr. Budd, Bath, was 2nd.
With twelve trebles in the Amateur division Dr. Budd was 1st ; and Mr. A. H. Gray, Bath, 2nd. With twelve blooms the positions were reversed, Mr. Gray was 1st, and Dr. Budd and. Mr. H. MATTHEWs had the best twenty-four bunches of cut flowers, chief among them were Valotta purpurea, Allamands Hendersani, Bougainvillea ghabrn, Foinciana pulcherrims, Aristolochia elegans. \&c.; 2nd, Mr. G. shelton, ET. to W. K. Wait, Eeq., Clifton.

Messrs, Keynes, Wiblians \& Co., Saliebury, had the best twenty-four Dahlias, and Mr. GEo. Humprarze. Chippenham, was ind. both haviag very good blooms indeed; and the same exhibitors were severally lat and 2ad with twelve fancies.
With twelve blooms, Mr. GKO, CooPER, Chippenham, was let, and Messrs. J. Cray o Co.. nurserymen, Frome, 2nd. The only exhibitor of twelve bunches of single Dahlias was Mr. T. smith, gr. to Thos. Carr, Esq., Tiverton, who was placed 1st with excellent varieties well-staged. With twelve Pompons in bunches there was a capital competition; Messrs. J. Cray \& Co. were 1st, and Mesars. Keynes \& Co, 2nd.

With twelve bunches of Cactus varieties, Messrs. Cray \& Co. were a pain lat; thes had Mrs. Peart, Dalicata, and Lady Penzance, very good; Mr. T. Casir was 2nd also with a good selection.
Quilled and fiat-petalled Astern ware very good, the fine Comet varieties taking a prominent position. Gladiolua spiles were shown in twelves; Mf. F. Hoprias, Bath, was 1st, and Mr. J. J. Younc. Wilton, 3nd. Pansies, Carnations, and Plicotees were very creditable for the senson; Hollyboeks better than we have been accustomed to see them.
Bunches of hardy annuals made a fine feature, Salpiglossis, white Sweet Pea, purple Jacoboes, Malope grandifiora, and a few others being very fine. Mr. Geo. Garratuy took the Ist prize. Epergnes. Bouquets, those of wild flowers, especially wreaths, Ace., were a very pleasing feature.

## Frut.

The best twelve dishes came from Mr. G. PYMM, who had Black Hamburgh and Muscat of Alezandria Grapes Roysl George and Exquisite Peaches; Lord Napier and Humboldt Nectarines; Apricots, Bon Chrétlen; Pears and "Telons, all very goed; Mricots, Bon Chrétion; Peare and

Black and White Grapes, Dinmond and Bellegarde Peachea, Humboldt and Downton Nectarines, Fige, \&e.
With six diehes, Mr. H. W. WARD, The Gardens, Longford Caetle, Salisbury, was 1st, having Black Hamburghand Foster's Seedling Grapee, Sea Eagle Peach, Moor Park Apricot, Figs, and Melons: 2nd, Mr. T. Erry, gr. to Captain Spex, Chippenham.
The best two bunches of Black Grapes were Eamburghs, from Mr. J. Gibson, gr. to Earl Cowley, Chippenham; Mr. J. Wright. gr. to H.O. Wills, Esq., Bath, Was 2nd.

The best two bunches of white Grapes other than Muscats were Buckland Sweetwater, from Mr. ATwELL; and Mr. WARD was 2nd with the same. The best two bunches of black Muscats were well-finished Madresfield Court, from Mr. black Muscats were well-finished Madresferme.
Mr. W. Carponter, gr. to A. R. Bailey, Eeq.. Frome, had the best two bunches of white Muscats; Mr. T. Bodges, Gr. to J. Forth, Eeq., Bath, was 2nd. There were plenty of Melons. Apricots were represented by fine Moor Park. Plums, green and red, were very good. The best two dirhes of dessert App!eg were Beauty of Bath and one unnamed, from
Mr. G. Garraway ; Mr. R. O. Hall was 2nd, with Beauty of Bath and Kerry Pippin.
The best two dishes of culinary Apples were Peasgood's Nonsuch and Warners King, from Mr. Strugnell; Mr. A. H. Suffield. There was a very largood's Nonsuch, and Lord bearing testimony to the fact that there are some very fine fruit in this district.
Messry. Geo. Buny $\triangle$ RD \& Co., Maidetone, had a large collection of culinary and dessert Apples, chief among them Pott's Seedling, Frogmore Prolific, New Hawthornden,
Warner's King, The Queen, Northern Dumpling, Yortshir Warner's King, The Queen, Northern Dumpling, Yorlishire Beauty, Transparent, Stirling Oastle, Domino, Lady Sudeley, Red Quarrenden, Cardinal, Irish Peach, Williama' Favourite Duchess of Gloucester, Worcester Pearmain, Beanty of Bath Early Julien, Kerry Pippin; a special Certificate boing given in recognition of their high quality.
Mr. W. New MaN, Bath, had the best oentre piece of flowers and fruit ; Mr. J. Atwell, gr, to J. B. Braiv, Eaq., Clifton, was 2nd.

## SHROPSHIRE HORTICULTURAL.

Augost 21.-This Society held its annual great show in the Qaarry, on the above date, in semitropical weather, and once more it is our pleasing duty to congratulate the committee and the able Hon. Secm, Memara, Adnitt and Naanton, upon the result of their combined efforts to make the twenty-firt annual show aperior to all shows of the kind hitherto held by the Society. The show was one of such magnitude and the individual exhibite so uniformly good, that with the apace at our command we cannot do more than mention the more important exhibits, with the renult that many deverving exhibits cannot herein be referred to.

## Plamts.

We may here remark that the twenty-eight scentod-leaved Pelargoniams exhibited by our clever correspondent, Mr James Hudson, gr. to Mr. Leopold de Rotischild, Gunnerabury House, Acton, London, excited a good deal of attention from visitors, all the more so owing to the fact that the plants were stagod with admirable effect in the open, having one of the largest tents for a background. Bearing in mind the attention the exhibit com mander, it may be of intorest to the readors flat-trained, and about O feet in width; filicifolium odoratum, a fine plant; Quercifoliam Mrs. Douglas, Q. minor, Lady Plymouth, FumsQuercifoliam Mrs. Dougtas mariety not often mith; Pheasant's foot, a fine plant; Mrs. Kingobury, Rollison's Unique, extre-fine; crisplant; Mrs. Kingebury, Rolizon's Unique, extredine; criso
pum, Fair Ellen, Aurora, Preety Polly, extra good; Lothario, pum, Fair Ellen, Aurora, Pretty Polly, extra good; Couterio, Devon, denticulatum minor, a variety that deserves to be more extentively grown; denticulatum, a fine plant: Blandfordiense, Lady Mary, Little Gem, a good plant, Fragrance, of fine size: Scarlet Unique, extra large; Major Ularke, Shottesham Pet, and tomentooum, a really fine lot, which richly merited the Gold Medal which was awarded to the cillection.
Prizes amounting to $\mathfrak{e 2 5}$ and $\mathfrak{L 3 0}$ were offered for twenty stove and greenhouse plants in bloom or foliage. Mr. Cypier Cheltenham, was lat for a good all-round lot of large, well grown plants, the most prominent being Statice protusa, Izora
Williamsii, Rondeletia apeciosa major, Rrion obbita purpurea, Williamsii, Rondeletia apeciosa major, Rrich obbita purpurea, Bongaiavillea ganderi, Crotons Sunset and Qieen Victoria,
Ec.; Mr. Fiach, gr. to Jas. MAnriotr, Eeq., Coventry, was ac. : Mr. Finch.
Mr. CYPHER was also lot for four Crotons, showing fite plants of Thompsoni, Sunset, Queen Victoria, and Chelsoni Mr. Frwce boing 2nd. The lant-mentioned exhibitor was 1 s for six flowering plants, showing good plants of Erics MarMr. CypRER was 2nd.
Menars. James Vgitcr \& Sons, Cheloen, showed a grand lot of Caladiums and Pftcher-plants, and a Gold Medal was awarded to them.

## Groups.

As urual, these formed a feature in this show. severnl good arrangements being put up for the liberal prives nfered, E20, e16. S14, and 212. Mr. OYpHers was a decided lat, his exhibit consisted of aseries of mounds having otnhal planto of
brightly-coloured Crotons, Calndiumes, and Orchide, iecluding several nice piecer of Deadrobinms. Phalenopais schroderians. and Cattleyas; the central middle arrengement partakian of an effectively-construoted arch. Mr. EDWARDS. Bestwood Lodge, Notts, was 2ad; and Mr, Finci was a creditible srd.
Mr. JOHM Cowfe, Liverpool, hed a fine proup of dwarf Roses in pots, mostly Teas, which attracted a good deal of attention, and well deserved the Bilver Medal which wis a warded to it. Mears. Pritceard \& Bors had an eztoasive a Gold Medal was properly enough awarded.
Mr. Edwin Murrell. Portiand Nursery, Shrewobury, was awarded a Silver Medal for Bogonias ; as also was Mr. Davis, of Yeovil, who as usual had a fine array of cut bloome of the newer donble and single flowered tuberons-rooted Begonias.
 sive collection of Ferns of decorative size and height: Mewrs. Smith. Worcester, obtained a Silver Medal in recognition of their exhibit, as alno did Messes. Myrrs, Shrewabury: Mesrm. Brinnife \& Co. receiving a aimilar award; an alwo did Mestre. Hewitt, Solihull, Edgbeton. Mr. Eckforn. Wom, rained a like distinction for a grand collection of Sweet Peac, of varied and beautiful shades of colours.
Mesars. Cutbush \& Sons. Hiphgate, had a grand and varies Sows, of Altrincham, had a good asoortment of herbacoous flowers, and an extensive display of Cactuses, including good Gasteria Crouchri and Echinocactus Leeandi; the Mesers. Dicksons also contributed good collections of decorative plant and cut blooms, and herbaceous flowers. Mr. JaMis CxpHer secured premier position for six Orchids in flower, distinct, secured premier position-flowered species.

## Cut Flowers

Theee made a grand display in themelves. Mr. EDWIN Murrell, Portland Nursery, Shrewsbury, bad a grand exhib tion of Roses arranged in various ways-stawdards, arches, \&c. to which a 2nd prize was awarded; Mr. Baly Cnosshing taking lat for a good arrangement in this claes.
Dahlias were etaged in large quantities, the quality being also of a high order. Memis. Kernes, Williams a Co. Salisbury, were easily lat for a grand lot of blooms, including all the leading varieties.
Ball bouquets and bridal bouquets, Messrs. Jones \& Sons, Shrewsbury, were lst for grand exhibits, composed mostly of Orchide, and well arranged; Messrs. Perkins, Coventry taking 2nd in a good class. The last-mentioned firm secured premier position in the class for a display of floral arrange ment on a space 12 feet by 5 feet. This exhibit contained variety of good designs, and choice Orchids were employed the several arrangements. Mesars, Jowes \& \&on and Mr J. R. Cenard taking 2nd and 3rd.

## Fruit.

The Society having attained ita mojority this year, opecial prizes were offared in the sehedule for a collection of twentyLycopodiuens, and other trailing plants; Terns and foliege being permitted to be ured for effect: 1et prize, e20; 2nd, £15; 3nd, el0; 4th, 25. Your good ints were staged, each exhibitortaking a prize. Mr. GOODACRE, gr, to tho Earl of harregton, E/vaton Castro, Darby, was a good 1st, etaging good full bunches of Gros Maroc, Muscat of Alexandria, wolid. well-coloured bunches; Barbarossa, good in aize, and benutifully coloured; and Foster's Seedling Grapes, Royal George, Princess of Wales, and Barrington Peaches, large, even, well coloured fruits of each variety being shown; Moorpart and Hemskirk Apricole, Victoria Pine-apple and Klruge Nectarines, of grand size and colour: Washington and Kirk Plums, Jargonelle Pears, Lady Budeley Apples, two fine fruits of Hero of Lockinge and Countess Melone, medium-sized Queen and Cajenne Pines, and Eon Chrétien Peart, all boing arranged to the best advantage in a groundwork of mone backed up with small Palms, Ferms, variegated stasses, and fringed with variogated Euooymus and Sarilax. Mr. Mcindoe was a creditable 2ad, his collection including fice dishes of Clapp's Favoarite, and Souvenir du Congres Pears, Magnum Boanu Plums, Brunswick and Negro Largo Figs, Stirling Cantle (highly coloured), and Violette Hative Peacher, and graudly-coloure S Spenser Nectarines. W Edwards, gr. to the Duke of 8 T . ALbans, Bestwood Lodge was a good 3rd; and Mr. H. PITT, Abergavenny, was a fans 4th. It is to be hoped that the society moy see its way to offer these liberal prizes annually, and to insist upon fewer planta being employed in the arrangement, 80 as no. to detract from the appearance of good fruit.
In the class for eight dishes, Mr. McIndot secured promier position with a good all-round lot of fruit. Hi lot ineluded pood Cros Maroc and Muscat of Alexandris Grapon sud a grand fruit of Mulon, Mammoth EMrugo Nectarima, and Stirling Osutle Fach, Ernad Negro Largo Migs, and souveair
da Congres Pears ; and Mr. Goopacas whe a good 2nd-wever lots were staged.
In the clan confined to Salop, five food lotn were staged, ine dishes, Sir C. H. Hovx, Boughtoo, Ludlow, taking lit, bis callection containing suod Black Hamburgh and Buckland avetwater Grapes, and Pine-applo Nectarines.
Grapes.-Three huodred and mineteen bunches of bigh quality were staged in the various classes. In the class for six buncher of black Grapen, in three varieties, seven good lote were put up. Mr. Craven, rr. to I Grant Morris. Rs j.. Liverpool, was placed lat for Madresfleld Court, Black Hamburgh, and Black Alicante; Mr. J. W. Raines, Rock Ferry, was 2ad, his half-dozen brucbes including fine specimens of Mrs. Pince, large ia bunch and berry, and fine in colour for the variety; Mr. Lambert, Ef. to Lord Hamiect, wan pleced 3rd for really fine exhibitt.

Mr．MoImpor secured Mearb．Pearson＇s prize，oftered for the mont meritorions exhibit grown with the aid of their manure，showing sood examples of Gros Maroc．
Eight lots of Black Eamburgh，three bunches of each，were hown，chief honours going to Mr．F．M．Prankliw，Cam bridge，with large full bunches，fine in berry and finish．Thi was a fine clase，all the exhibits being of $a$ high order．
In the clase for any other black，six good standa were staged the lat going to Mr．Ranwes．for good specimens of Madres field Court．Right boards of four bunchas，two varieties，of white Grapes，were ataged．Mr．Craven taking 1st，with good bunches of Muscat of Alexandria and Buckladd 8 weet good bine in rery reapect，the last－named exhibitor also had Whe be 1 O the best three buncher of Muscat ol Alozand aia．in a good clase ahowing good solid bunches，large in berry，and well－coloured In the any other white Grape claes，Mr
good lot，with fine banches of Mrs．Pearso
In the classes confined to the county of Salop，Mr．Alderrion Oswestry，was a good 1st，for two fine bunches of Black Hamburgh．Several good lota were shown in this class，
Mr．Lambert was a capital 1st in the any other black Grape class，with grand bunches of Madresfield．The same exbibitor was also well ahead for two bunches of Museats．
Melons were well shown．Carter＇s Blenhoim Orange，shown by Mr．Craver，was the bent scarlet－fleshed variety；and the Countess，shown by Mr．Goorsore，was lat in the class for green－fleshed．
Peaches made a good show，Mr．Harris，gr．to Lady Henry Somerset，Eastaor Castle，Ledbury，was a good lot with Barrington．
Eighteen dishes of Nectarines were put up．Mr．Ingwood gr．to T．F．Kinerley，Esq．，Tronbridge，was a capital 1st， with grand fruits of Pineapple，beautifully coloured

## Vegetables

The classes devoted to prodace from the kitchen garden， though of the usual character and possessing no novel charac－ teristics，were very repreeentative，and the exhibite usually were of the highest quality．Judging from the produce on the tables，little injury has resulted to garden crops froma the drought experienced during the early part of the season．

## Collections．

There were five competitors for the principal collection，in which twelve linds were to be included．A capital exhibit from Lady Theodora Gudst，Henstridge（gr．，Mr．T．Wilkins） won，and was closely followed by one from the Earl of Carnarvon，Highclere，Newbury（gr．，Mr．W．Pope）
In the first collection the Carrota，Cauliflowers，Onions， neans，Peas，Celery，Potatos，Leelks，and Beans，were of the highest quality；and the various dishes from the Karl of Cakialin can only be described in similari terms；Mis Tılbot，Panrice Castle，Swansea（gr．，Mr．Milner），was 3 rd．

A similar class，open only to the county of Salop，was won by Mrs．Watking，Shotton Hall（gr．，J．Birch），and this exhibit，together with several others，was evidence that vegetable growing in Salop is not in the least neglected．
Potatos were good in quality and clean．In the class for six dishes，there were a very great number of exhibitors，and the winner of the lst prize was the Earl of Carkarvon，Highclere Castle（gr，Mr．W．Pope）．His varieties were Supreme， Readiag Russet，Prizetaker，Windsor Castle，Satisfaction， White Kidney；2ad，Earl Lathom，Ormekirk（gro，Mr． Hathaway）；and 3rd，Mr．F．Dobsor，Keele，Staffordshire， exhibits were again very numerons．In the claes for three dishes，the Earl of Carvarvoragain being 1st；and the Earl of Lathom， 2 nd ．
Lady Theodors Guest was lst for one dish，with Gold－ finder；and the Rarl of Latroy was 2nd
Tomatos．－The besh dish of Tomatos whe one of six medinm－ izod good fruits of Webb＇s Senaation，exhibited by J． Grant Morris，Req．，Liverpool（gr．，Mr，J．J．Craven）；Lady Theodora Guest was 2nd．
Pods were not specially good，many of the pods being badly filled．There were，many dishes shown，however，and G．F．C． Byortist，Eoq．．Broseley（gr．，J．Jones），was 1st；and Bears，The Esq．，Tanybwich（gr．，Mr．J．Robertson），2nd． Waite，gr．to the Hon．W．P．TALBot，Reher，Surrey；and quility，the extibits ware was 2nd．Though not of extra henne ware oxhribit ware satisfactory．Excellent Runner Mr．F．Walter）；Lord Trevoin，Chirk（gr，Mr．F．Bible），（gr．， Cucumbers．
Lamley），had two Rery Darley，Haschurch（gr．，Mr．R Lawley），had two very pretty Cucumbers；and Col．B．T Lloyd，Oswestry（gr．，Mr．R．C．Townsend），was 2nd．
Cauliflowers were well shown，and the three heads from Mr， （ill Hr．，Mr．J．Birch）， and good quality，1st ；A．M．Biddulph，Eeq．，Chirs Castle Celery W．F．Roderick），was and
Celery，on the whole，was not of exceptional quality，but there were three very cood sticks of a white variety from Mr． ．Guxse，Hadaall（gro．，Mr．J．Abbott）
Parmipz，Carrots，Turnips，je．－The best Parsaips，among a very good collection，were some from Sr．J．Hazellding， Ksq，Woodlands，Shrewabury（gr．，M（f．Edwards）；and Mrs．Warkiss，Shottoa Hall，was 3nd．Mre．Watrivs had capital Clarrots，and won among many good exhibitu；the The beat six bunind
Owwetry；and Lady Treoporis Guser Cai．R，T，Lioyd， oown Onions，amon Treopoli Gurest was ht for untume GREATOBEX，Req．，Mytton very antiafictory exhibith，J．R Greatonex，fuccesul，Mytton Hall（gr．，Mr．W．Leith），was the wore several olay in the class for apring－sown Onions．There and Pess，aporaseny to amateurs．

## specint Prizes．

Numerous exhibits were staged in competition for prizes offered by Messrs．Webr \＆Soss，Stourbridge；Suttor \＆ Sons，Beading ；Pbitchard \＆Sons，8hrewsbury ；Mr．Crews， Banbury；Mr．H．Deverill，Banbuty；Mesers．W．Clibran Banbury；Mr．H．Devercle．BYDENHAM，Birmingham ；and Mr．E．Murrecle．Shrewsbury．
Is Messrs．Whebr＇s class for a collection of vegetables，inclu－ ding eight kinds，the lat prize was taken by Lady Theodora Guest，and the Earl of Carnarton was zud，whilst Messrs Sutror \＆Sox＇s principal class was won by the Earl of Lathom，who was followed by the Earl of Carnarvom
Messrs．Carter＇s class for four dishes of saladings was well contested，the 1st prize going to Mr．W．J．Empson，gr，to Mrs．Wingrield．Ampthill．The other seedsmon＇s classes Mrought together some satisfactory exhibits，including ex celleat Onions．
Cottagers had a considerable number of classes devoted to themselves，and the produce from these lesser exhibitors was by no means of inferior merit or quality．

## A CHILDREN＇S FLOWER SHOW AT ST．MARY＇S，WHITECHAPEL．

Floriculturn is reprementative of several useful societies of the kind now in operation in the east of London．They are formed in connection with the Day and Sunday Schools，the object being to interest the children in the calture of flowers in their homes．
St．Mary＇s is a red－brick built church on the right hand side of the Mile End Road，a half mile or so east of Aldgate，and early in the year a number of plants are bought－a selection being made of those which it is thought probable the children can cultivato with something like sucoess，and they are sold to the children at a merely nominal cost；a record is lept of each plant so supplied，and two or three months afterwards the children are required to exhibit them at a flower show held in the evening，when the parents of the children can attend．Some small money prizes are aw arded，the disused churchyard in which the show is held is dressed out with flags， a band composed of some of the young men connected with the church performs，and quite a tête is thus held．But this is not all the hon，sec．，Mr．F．A．Pasty，who is a post－offioe official，and an indefatigable worker，as well as an enthusiastic amateu gardener in Stepney，provides soil，leaf－mould，sand，cocoa－ fibre，\＆c．，and gives the children object lessons as to how to pot plants，and also elementary addresses dealing with the managersent of plants in windows and homes，all the more necessary，because many of the childran reside in courts and alleys，where the atmospheric conditions are by no means favourable to satisfactory culture．The ohildren are sncou－ raged to cultivate bulbous plants，such as the Hyacinth，Tulip， raged to cultivate bubbus，plants，such as the Hyacinth，Tulip，
Crocue，Snowdrop，Scilla，Narcissue．\＆co，and these are sup－ plied at a rate that may be said to place bulbs in the reach of all．On the occasion of the summer show on July 19，some 132 children entered for competition，and out of 345 plants supplied，more than 201 were brought to the show．The best－ managed plants are Zonal Pelargoniums，Fuchsias，Creeping Jennies，Lobelias，Calceolaria，Aspidistra，Campanula，\＆c and not a few of them show that gr ＇at attention has been and not a few of them show that Rr at attention has been derived from the sale of plants and flowers to visitors，by gate money，and it is satisfactory to know the sum of $\mathcal{E l} 1 \mathrm{~s} .6 \mathrm{~d}$ was taken in the form of admissions；the sale of refreshmenta brings in something，and a few donations，make up an income of between six and seven pounds，and the expenditure being something less．A satisfactory balance is carried forward Surely much good is gained by interesting the children in the culture of plants．

## MARKET8

## COVENT GARDEN，August 22．

［We cannot acoept any responsibility for the subjoined reporta．They are farnished to us regularly every caleemen，who revise the list，end al of the principal for the quotations．It munt be remembered that these quotations do not represent the prices on any particular day，bat only the general averages for the weel preceding the date of our report．The prices depend upon the quality of the samples，the supply in the market，and the demand；and they may fluctuate，not only from day to day，but often sereral timem in one dar．ED． 1

## THEPA\&T WEEK

THe following summary record of the weather throughout the British Islands for the week ending August 1\%, is furnished from the Meteorological Office:-

The wather continued unsettled and rainy in all parts of the Kingdom during the earlier half of the period, with occasional thunderstorms over England. Towards the middle of the period, however, \& gradual improvemont set in, and et its close the weather was fine and bright in nearly all places.
"The temperature was sllghtis above the menn in most dietricts, but only just equalled it in ' England, E., S., and S.W., as well as in the "Channel Islands.' Daring the greater part of the weak the daily maxima were considerably below the normal for the time of year, but on the 17 th the thermometer pose to between $77^{\circ}$ and $79^{\circ}$ over ' England,' $73^{\circ}$ and $78^{\circ}$ in Scotland,' and $71^{\circ}$ and $74^{\circ}$ over 'Ingland,' $73^{\circ}$ and $78^{\circ}$ in scotiand," and $71^{\circ}$ and $74^{\circ}$ in "Ireland.' The lowest of the anged from $36^{\circ}$ in "Scothand, E.' and $38^{\circ}$ in the "Midland Anged from $30^{\circ}$ in 'gcotland, E.' and $38^{\circ}$ in the 'Midland
Conatien' to $50^{\circ}$ in ' Bingland, N.W." and $53^{\circ}$ in the 'Ohannel
lan ds.'
"The raiafoll waried a good deal in ditferent parts of the Kinglom, the amounta owceeding the mean $2 n$ "Bcotisnd

England, E. and S., and Ireland, $\mathrm{N}_{\text {, }}$ and being somewhat below it in the other diatricte.
'The bright sunshine was deficient over the Kingdom as a whole, but exceeded the mean in 'England, S. and S.W. and in the Channel tslands." The percentage of the possible duration ranged from 69 in the "Channel Islands.' and 38 in England, S.W.,' to between 18 and 24 in "Ireland,' and to between 16 and 26 in 'Scotland.

** Owing to the large increase in our circulation, toe are reluctantly under the necessity of going to prus some hours carlier. Out contributors, who well know what this impliss, with dindly aid us by sending their communioations as carly, in the wednesday.

* Plants, Fruits, etc., to be Named.-Correspondents sending plante or fruits to be named, or asking questions dsmanding time and research for their solution, musi not expect o obtain an answer to their enquiries in the current wsek Specimens should be good ones, carsfully packed and numbered, and not more than six should be sent at one time
A Month's Warning: G. S. Domestic and Menial Servants, with regard to these, there is a wellknown rule, founded on custom, that their contract of envice may be determined at any time by giving a month's warning, or paying a month' wages, and this, although they be hired at moch a jear. A head gardener at $£ 100$ a year wagen, who renided in a detached house belonging to his master, has been held to be a menial eervant, and entitled to a month' warning only. Nolan $v$. Ablett, 1835. 'This case was argued before four judgen in Banco, and is reported as a leading case. They decided that as the gardener remided in a detached house intra menia he was a menial or domentic.
A New Vink-Border: Gardener. The chief constituent is good turfy loam freshly cat, and any of the ingredients you name in moderate proportions may be mixed with it. The bones should be broken finely - say, half-inch, and may be employed at the rate of one-ninth of the whole of the loam, that is, 3 cubic feet out of the 27 cubic feet constituting a cubic yard (one-horme cartload). Charcoal and lime-rubbish hould be used in smaller proportions. The border should be afforded ample drainage, and the outlet drains given a rapid fall, $s 0$ an to clear themselven rapidly. The border ahould not be more than 2 feet deep, and at the first not more that 6 feet wide.
Bulbs Left in the Ground: $D, T$. $H$. They ought to have been liffed when ripe, eny Jane and July. They have now made growth, and would be injared, but not killed, by removal.
Carnations: J. Cobban go Son. The coloura are an good and clear an any that we have noticed this year, bat in size the blooms have often been exceeded by others sent for our inspection.
Cori for Catrimyas, Lerlias, and Dendrobiums Amateur. Not so aitable as pots or pans for the firt or second; but they would grow fairly well if you can secure some lampa of a proper kind of Orchid peat and Sphagnam-mosa about them, 10 that their roots do not suffer from rapid fluctuations of mointure and aridity. The Dendrobiams if properly aecured with Sphagaum-mose bould grow satiffactorily.
Correction.- Northampton Horticultural Show Report, August 10. Inatead of par. beginnirg "Some well-grown Ferna," p. 164, read "The bett six Ferns were taged by Mr. W. Pearce, gr, to Sydney Loder, Esq., Floore House, Weedon, who was awarded 1; Mr. Copann, gr. to Mri. Phippis, Colliagtree Grange, 2; Mr. J. B. Palmer, gr. to R. Tarner, Eiq.. Cliftonville, Northampton, 3."Re "Eruit at Glewaton," p. 180, fifth and aixth lines from bottom, it should read "The trees are 9 to 10 feet high, and being the ame in diameter, they occupy the whole of the ground."
Cepripedium Ueruality: A Subscriber. It is diffcult to ay what carses the brown and unhealthy appearance seen on the leaf of Cypripedium tent. It appears to be of atunted growth, and it may probably have been kept in a too dry and unny fituation. To better itt condition you mast arrange for a freer growth in futare. Plants in uch condition may often be brought round by being turned out of their pois, wathed top and root, the
latter free from all the old potting material. Then re-pot in amall pote, using equal parts of lommfibre, peat, and aphagnum. Place in a healthy growing house, and water reasonably with rainwater.
Dredrobiuk Lear Turning Brown: Amatour. The effect of too mach heat and moisture and a close sirless house. Under these conditions mont Orchid grow weak and delicate, and fall a prey to both animal and vegetable parasites. Afford more air, lew whade, and let the house get dry at least once a day for a few hourn.
Gas Lime: Constant Reader. Use about an much at will cover the land from night. You may use more of it if the land is going to remain uncropped till the spring.
Hardy Annoals: D. T. H. Sow now seede of all those you mention excepting the Canary Creeper, the hardiness of which, even in your county, is doubtful, and Sweet William, which is best sown in early mommer to fower the next year. Sweet Williams raised from seed sown at this date would flower in the height of summer, and would lant but a short time.
Horticultural Examination Syllabus: J. W. W. Apply to the Secretary of the Royal Horticultural Society, 117, Victoria Street, Weatminster.
Insects on Rosm-bush: T. A. The caterpillar is that of Amphidacys betularia, commonly known at the "Pepper-moth." It feed on a variety of trees and hrubs, bat is seldom so abandant as to be considered an "injurious inaect."Jones, The mase consinta of the cocoons of a minute Hymenopteroun insect, the larva of which to the number of several handreds, had fed in the interior of the body of a caterpillar of 10 me Lind. which it is impossible now to recognise. $R, M c L$.
Ivy Cotrinas: Constant Reader. The cuttinga, half ripened hoote, may now and later, be pat into moiat, andy, manured toil, in partial shade. The variegated varieties strike bent ander hand-glasses. Kew Bolletin": J.M.T. Any bookseller, or from Eyre \& Spottiswoode, Esst Harding Street, Fleet Street, at $4 d$. a part. Tha post-office nearent the main entrance is that on Kow Green ; but there are others!
Lilies : L. C. L, Hamboldtii, L. Parryi, and in warm situations, L. longiflornm, are hardy with slight protection. L. Harrivi is greenhouse plant reverting to L. longiforum, L. Krameri is rarely kept long uader any nytem, $H, J, E$.
Lobila rbinua Cuftingas: D. T. $H$. They will strike at this seman in a clone frame, sither planted in pots or on a bed of loamy soil covered with a lajer of aand. If a alight bottom-heat can be afforded, the triking woald be quick. The length of a cutting 2 to 3 inchea.
Mignonette: $D . T . B$. Gather any of the capaules when the seed is seen to be either dark brown or black. Do not pluck the entire risp of aeedvesaels, as there are aure to be many unripe seeds therein. Look over the planter every third day for ripe seed. Dry in the shade.
Names of Fruits: W.J. Holmes. Peat: Rousselet de Stattgart.-R. Hughes. 1 and 5, Dachens of Oldenburgh; 3 and 6, Red Aatrachan; 2 and 4, not recognised.-R. McDougall. Specimen sent not yet developed, $s 0$ cannot determine with afety. No. 1 and 2 may be Cellini ; others not recognised.-G. Albert James. 20, not nufficiently developed; 21, Cox's Orange Pippin; 22, Lord Gronvenor.-Carlton. 1 and 3. not recoqaieed; 2, Waitham Abbey Seedling; 4 and 5, Dachees of Oldenbargh; 6, Rosemary Runet.-Biddles. Small Ponr, not recognined; worthlens.
Names of Plasts: Correppondente not answerdil in this isme are requested to comoult the next mumber.C. Pyrut foribunda, Nicholeon (Malu* floribunde, Sieb.), Japan.-G. G, S 1, Alstromeria pititaciaa, 2, Lythrum malicaria; 3, Lysimachia valgaris ; 4, Asclepias sp.;5. Linaria purpurea; 6, Hyoscjamus niger; 7. Calcoolaria.-R.T. $\boldsymbol{H}, 1$, Stuartia pentagyna; 2. Larus Sassafras; 3 Acer creticam.Alpha. 1, Catalpa syringzfolia; 2, Oncidium Ciurdneri, Lindl., Gardeners ' Chronicle, xvi., p. $86^{\circ}$; 3, Eupatoriam (Conoclinium) ianthinum. $-R$. . I, Zebrias pendals, greenhouse; 2, 3, Zobrina pendula var, tricolor, tove; 4, Panicum variegatom; 5, leaf only; 7, Centaurea monchata. bardy annual; 8, Scabione atroparpuren, hardy, Why and wretched crape, badly packed and nam-
bered? - H. May. We should refer both to Inula Hookeri.-H. M. E. Mentha aquatica. The Secretary to the Garde ner''Orphan Fund is Mr, Archibald F. Barron, Royal Horticaltaral Society's Garden. Chiswick, W.-J. C. Linaria reticulata var. aureo-purpurea.-G. S. R chea falcata.-A. Brothers. Statice latifolia.-A. L. Amorphophallos bulbitry. -W. K. L. 1, Radbeckia laciniata, L.; 2 Radbeckia californica, A. Grayo - Fo. P. Dendrobium chrysanthum. - Constant Reader. 1 and 2, Not found; 3, Dandrobium chryannthum; 4, Dendrobium formosam, very good; 5, Dendrobiam Findlayanam; 6, Pholidota imbricata; 7. Polypodinm valgare var. cam-
 L. B. G. Stanhopea tricornin, Maxillaria Mackayi var.
Oncerids: S. H. 1. The cause of black spots on the Leaves of Epidendrum vitellinum is probably owing to its being grown in a too airy and zanoy boane. Although not wanting a high temperatare, it likes a genial warmth, tolerable shade, and plenty of water when growing. Afterwards, any greenbouse will do until the next growths begin. 2, The Peristeria asperaa (fresh imported) may bloom at any time. We zaw it in flower about five wetks ago. 3. The appearance you mention in Dendrobium thyraiforam reems to indicate weak growth not grown rapidly enough at the proper time, and then rested. Hence the new growth pushes forth before the previons one is fully made.
Pest: Amateur. It in not the right kind for Orchid culture, but would suit Heaths. Get Peat for your Orchids that has a ailky pleasant feel, and little or no wand in it, but which has plenty of decaying roote of Ferns, \&c. It should be in a partially decajed state when uned.
Ratise: Montanc. Glasehouses in which frait. flowers, and vegetables are grown for sale, are to be rated at only one-fourth value. See Parser $v$. The Worthing Local Board, in Gardeners' Chronicle, vol. i., 1887, p. 422.
Raubarb: H. L. Certainiy Rhabarb in not a cultivated torm of the common Dock.
To Drive awat Ants: G.T.C. and G. A. Find their neste, and pour carbolic acid diluted with swelve times ite balk of water into them. Petroleum, aulphur, goano, gas-tar, lime-water, are all effectan in driving them out of their haunts. More than one application may bs necessary.
Thopmolus Sred : D. T. H. The fleshy covering is always fresh aud green when the seed falls, bat it soon dries ap, and may then be rabbed off and the seed stored in paper-bags in a cool, dry place.
Tonatos Diges sed: W.W. The aporea of the fungua were floating in the air, and conditions of warmth and moiature being favoarable, they attached themselves to your plants. These sorts of enemies of plant-life aboand everywhere, and the gardener cannot do better than apply preventive remedies before an attack occura. See our inaue for Auguat 10, and many others this year.
Wiek Berry: W. T. T. Rabus phcenicolaniue.

WONDERS WILL NEVER CEASE, we are told ; but it cannot be denied that HokLowsy's pILLS are the greateat wooder of modern times. They cor-
rect bile, prevent flatulency, cleanse the liver, and purny the rect bile, prevent flatulency, cleanse the liver, and purity the
systema, strengthen the stomich, increase the appetice, invigorate the nerven, promote health, and reinstate the weak to an ardour of feeling never bafore experienced. The sale of these
Pills throughout the glutie astonitheas everybody convincing the most sceptical that there is no medicune ecyal convincing WAY's PILLS for remoring the complaints incidental to the human race. They are indeed a cleasing to the afflicted the a boon to those who suffer from disorders, internal or eted, and Thonsands of pensons have testified that by their nsa alone they have been restored to health, after other remediee had proved unsuccessful.

# ORCHIDS, 

AN IMPORTATION OF THE BEST EAST INDIAN SPECIES

Has just reached me in Fine Condition, anongst which are the following fine Orchids-

## AERIDES LAWRENCEE.

This epecie and A. Sanderianum rank ao the two most lovely of the family, the long drooping racemes are noted for their brightners of colour, ine size of flowers and delicious odour. Roceived First-clase Certificate, September 9, 1884.

## AERIDES SANDERIANUM.

"T. L." in the Gardeners' Chronicle (August 24, 1895), mays: prove, were it needed, that this genus is well worth taking pains with.

## The plants offered are in grand conditioa.

## VANDA SANDERIANA.

A very limited importation of this NOBLR ORCBID, which is admitted to be one of the finest in cultivation. Nearly all the plants were established before being shipped; Consequently,
there will be minimam of uncertain plante. Many of the plants are in pots, and root-action is evident in many cases. All the plante are well furnished with foliage.
A GIGANTIC SPECIMEN,
THE LARGEST IN EUROPE,
is among the importation of this Vanda. It is in fine health, and WILL BE ON BHOW st the Nureery during the ooming weok.

## VANDA LOWII. <br> A fow plants of this lovely Vande.

PHALENOPSIS SCHILLERIANA.
Some fice sound plants, practically established, and sure to

## CYPRIPEDIUM STONEII.

Collected by an experienced man, who saw many fine forms in flower.

## GRAMMATOPHYLLUM MEASURESIANUM.

In fine masses. This handsome Orchid should be extensively grown. It received : First-clasa Certificate in May, 1801.

## DENDROBIUM DEAREII.

A fine in
Dendrobe.
DENDROBIUM BICIBBUM.
Many of these plants were sesn in flower by the Olliector, who writes that there are exceptionally good varieties.

## AERIDES QUINQUEVOLNERUM. <br> DENDROBIUM UNDULATUM.

With tremendous peeudobulbs.
A FINE NEW PALM,
CYRTOSTACHYS LAGCA.
A. Plant of graceful hatit, with stems and leat potioles of bright red colotu; it fa known by the natives as
"THE SEALING-WAX PALM."
Six of these Pinnte have arrived, and are, of course, wall eatablished healthy Plants.

This is entirely NEW TO COMMERCE, and is RARE.

Fuller particulars and quotations from-

(35 minutes from Waterloo.)

SATURDAF. AUGUST 31. 189\%.

## CHISWICK

A VISIT to the Garden after the recent storms enabled as to jadge of its condi-tion-and what did we find? Cleanliness in every part, walks firm and well rolled, although the marks of the storm of Tharsday evening, Aug. 22, showed themselves in a saturated soil, and a little silt acoumulated at the margin of the turf; the lawns vividly green, showing plainly that if the mown grass was taken away, something was added in winter or spring to maintain the fertility of the soil. That was quite as it should be. In the glasshouses also were found capital orops of Grapes, and Fig-trees whioh had borne good orops, but were now going ont of fruit for the sesson.
But perhaps it will be better to take the glasshonses seriatim, beginning with the more modern one near the entrance to what may be oalled the reserve-garden. Last year, and for several previous years, we believe, this house, originally planted with Vines, ohiefly Musoat of Alexandria, has aocommodated during the summer months trisls of Tomatos, and enormous orops have been gathered enoh year, and sold to defray in part the expense of up-keep. Now, the Vines demand the whole of the space, and no more Tomatos are grown therein. This is the first year in which the Vines have carried s full crop. The number of the bunches is about 600 , and the weight 900 lb . ; and those who know the market prices for fine Muscats, can calculate their value when fally ripe, say in about a fortnight from the present time. The Vines, from reasons of economy, were trained on wires under the central part of the vinery, and a oane is being oarried from each Vine down the two slopes of the roof, so that every part of the roof will be atilized. Nothing could be better devised in oulture than the Vines in this house. The older corridor vinery held equally well-oropped Vines, but owing to the Vines being trained against the back wall, and upright glass front, one could not take in the whole crop at a glanoe. The colour and finish of the Grapes in this oase will be oapital.

In what some consider the white elephant of the Society-the big vinery-there is a welldistributed crop on the forty-four-year-old Vinen, not in any point differing in appearance from former years. To soocunt for the good oondition of these Vines, the border must have beon made with great judgment and a oareful seleotion of materials, or else the roots must have wandered into the adjeoent well-manured ground. Some of the gardeners, it being a showery day with dull skies, were employed in searohing for decnying berries, and easing the berries where orowded. It was all right here, bat it is a matter for regret that the resouroes of an experimental garden should be devoted to the oultivation of Grapes to be sold as in a commercial undertaking; but having the vinery, perhaps no
better ase oan be found for it than to produce Grapes. At any rate, it is money-prodacing, and that may be a suffioient exouse, although experimentally it has now little value.
Having inspected the state of the Vineries, always considered the oruoial point in a gardener's management, and a test of his abilities, we found everything looking as well if not better than in some former years; other houses were visited, viz, the Peaoh-house in the inner quadrangle. Here the trees had furnished an early crop of fruit, and we saw nothing bat healthy vigorous plants whioh were being gradually matured by sun and air. Standing outside was a lot of young Peaches, Neotarines, Plams, \&o., whioh having done their work for the season, were being ripened off, the house they had stood in being furnished with Tomato plants with fruit approaohing ripeness. Most accommodating plant this-if you do not know what to do to fill the house, put some Tomato plants in it; and if you cannot consume the fruits, you can always find purchasers for them. There is no waste of gard ${ }^{\circ}$ n appliances and oonveniences at Chiswick, but every house is put to some kind of aseful parpose.
In one house only American varieties of the Tomato are growing, and but few differences were noted between these and those nanally grown in English gardens. The house in which these varietien are placed is a Memrn. Skinner, Board \& Co.' patent, with a curvilinear roof of amall apan, galvanised iron ribs fixed at very wide distances apart, the glass panes resting on strained wiren, and secured by metal clips. It reemed to need faller ventilation when the doors were cloued; but it suits the Tomato, which is a heat and run-loving plant.
The houses net apart for flowering planta wers the Canns-house-well furnished with thene beactifal, combined flower-foliage subjects. They were quite amall stuff when received in the apring, and bave had to apend their energiea in making leaver and roota, and, a a conaequence, there is not quite so much flower on them as older roots would have thrown. The selection is a choice one, and well worth an inapection. The side bencher are furnithed with varieties of Pelargonium peltatum (Ivyleaf), now past their beat, but which have been particularly beautiful this meason.
In another house was found a collection of pro-fusely-bloomed Fachsias, including good new varietien and old favourites. Another honee containa Balame, Celosias, Cockucombs, and Bouvardias; some pits are filled with zonal Pelargoniams for flowering in the winter, benides a quantity of miscellaneous plants of small value, for diatribution amongut the fellows -much of it dear as a gift. Its propagation and culture seems to take up a good deal of time and labour which might be more unefally employed. It is the fly in the amber.
Let ne now turn to the fruit treen on the walls. To ne, thene have always neemed to be the weak point at Chiswick, and eepecially wat this the caes daring the years of mivery, when the resourcos of the Society were expended in that children's playground at Kenuington Gore. The trees were then starved of the needfal manure and loam, althoagh the superintendent was too good a gardener to neglect the cuatomary vinter and ammer pruning. Since better times have set in, in the Society's affairs, the trees have improved, and excellent crops of Plums, Peaches, and Nectarines; a fair one in the majority of casen of Pearn, and some very heary crope on certain varietios that uanally can be depended upon to crop well, viz,, Williams' Bon Chrósien, Souvenir du Congrèt, Loaise Bonne, Madame Treyve, and Bellimime d'Hiver.

The Apple crop generally in a henvy one, especially on the lemeer praved standard and half-atandard trees, and on the restricted bushes on Donein and Paradius atocka. It is needleas to opecify varieties where nearly all have cropped well -atill, mention
must be made of a row of treen of Blenheim Orange Pippia, planted twenty yeare ago, and worked on every known kind of atock, which have a fall crop for the firat time. There is a fact worth knowing in regard to this variety, viz., that no kind of atock will hasten its coming into bearing. The other grand crop is that of Cox's Orange Pippin, which was never finer thas this year. The aged pyramidal Peara are, in numerous instancea, bearing very well ; and of Plame, capital crops of Pond's Seedling were remarked on standard trees. In fact, it is a record year for hardy frait at Chinwick.

There are extensive trials of Cabbagen, Lettaces, Tarnips, Runner and dwarf Kidney Beans, Potator, Endiven, Spinachen, Sweet Peas, Aster: Phloxes, bedding Begonias, inclading the mallflowered effective elegans type; of Dahlian of the no-called "Cactus" forms supplied by the larger growera.
To give the reader an idea of the extensive character of these trials, it may be mentioned that about 500 varieties of Phlox were planted from Eaglish, French, and German growers, the height, colours, time of beginning to bloom, being duly noted. Of Tarnips there are 37 varieties ; Spinach, 20; Cabbage, 76 ; Lettucen, 39; Beana, 74 ; Peas, new and old, 59; Potatoy, 70. The amount of clerical labour entailed in recording all the more essential points in connection with these trials is very great, especially as every report has to be written out three times. One rabs one's ejes on hearing this, and amk whether copying-presses have been invented. The writing of label for seed-beds and plantingu takes up a great amount of time. Thene trials, so far as they go, benefit the purchaser, or at least they are instituted with that intent; but inatead of being published in a form eacily accensible to the owners or cultivators of gardens, they are published long after date in the Societry's Journal, which appeara at ancertain intervale; hence they loae the merit of opportuneness, and become, as a consequence, of relatively mall value.
The out-of-doors floral decoration are well worthy of notice at the present time. They consist chiefly of a serien of bedn, circlen, and parallelograma, of various dimensions, arranged on each side of the long walk which leade to the great vinery. There were beds planted with old stock-plants of Fachsias, flowering abundantly; beds of Fuchsia fulgen, an old inhabitant of our greenhouse, but seldom employed out of doors, although in the warmer parts of the country it grows well and flowerw charmingly.
Begonias, both taberous and other, are planted in numbers, wometimes one variety being aned in a bed, and in other caven several of them are grown together for the make of readily estimating their effecte as bedders, tenting the comparative height of the plants, and various other points which it may be desirable to ancertain. There are bede of the glowing reds, crimsons, sec., of the large-flowered tuberous-rooted rection obtained from the best sources. Beds of Begonia semperforens in red, pink, and white, and very clearly these varieties showed their value as bedders; the varietien, Dacheus of Edinbargh, pink, and Reading Snowflake, white, were admirable. In the care of thene remperforens varieties, the blowsoms are manll, very numerous, and obtained from all parts of the plant, and being of a aniform colour there is no dall aide of the petaln to be seen in dull weather, at is the cane with the large-flowered Begonias. Old planty of Boavardia in variety are turned to good account, being planted ont in mixtures of other plants. They were manees of
flower. Cassia corymbos planted in circulsr beds has a pretty effect, the amoant of bloom on them being considerable. The asme may be said of Plambago capensia, the plents of which are covered with their light blue flowern, wo different in tint from the
other occupante of flower-beds.
It was remarked what a pretty edging plant in Sedum Eweraii, when covered with its namerous dull pink-coloured flowera, Canna indica, in the newer tarieties, was noted in flower; bat, like thone
well this reason. A bed or two of Zinnia eleprots pumila, consisting of a few distinct-coloured varitinn about $\frac{1}{3}$ foot in height were noted. This strain in decidedly better than the usual lanky one neen in
gardena, yet not so dwarf as Zinnia Hagema gardens, yet not so dwarf as Zinnia Haagome
Other beds consisted of Asters in variety, vinglos flowered Petunias, and yellow Margaeritea,
The beds of Tea and Noisette Roses were afiote ing a quantity of bloom, although these were bi very mall plants when put out at a late part of the spring. It was eany to see what the planter were liu before the storm of Thuraday had dashed the Alowern, for a time at least.
It is said, we beliere, that the cost of keeping n Chiswick is out of proportion to the resalta obtion, but that is a point very difficult to gauge, weim the multitude of plants dealt with, and the fe reaching natare of the results of the triale and methods of culture, when at length these have been dribbled out to the horticaltaral pablic.
No comparison institated with a private gurim is possible, except perhaps in such elementery matter: as digging, mowing, tree-nailing, and pruning, and the like mattera, which are the nmein all gardens. At Chiswick, the cost, time and hobour involved in the distribation of plants to the Fellom is very considerable, all manare muat be parchued, coals and coke bought at town prices, water apecillly paid for, raten and taxea are heavy, and labour mon highly paid than in country placen.
In making comparison between the cost of cine ducting Chiswick and a country entablinhmeth, thene are points which ought to receive due consideration. Who but the Saperintendent himulf nud his coadjatore have any notion of the laboar of recond ing the trials above-mentioned? moreover, there in the lons of labour from the garden which every mestigy at the Drill Hall entails; the gathering and patiung up of fruit, flowere, and plantu, for which thers if
nothing to ahow. The Saperiatendent has aloo to y as cicerone to visitorn, foreign and native, and eversone is courteously received, as should be the am, and shown round. Every time an individat il taken away from gardening operations proper, then is a distinct lons to the garden in money and tim, and this cannot but add to the expenves at th present junctare.

## New or Noteworthy Plants,

## CHLOROCODON WHITEI.*

To M. Naudin of Antibes we are indebted for pelo mens of this greenhoase climber (see fig. 48, p. 2 24s), It is an Asclepiad with olender, twining, cylindrimel branches. Leaves petiolate, opposite at diatant interp vals. Petiolen about 3 cent. ( 1 inch) long, alighty puberulous, channelled on the upper anfface. Nindala forming a band connecting the base of the tw petioles, and dividing into several anequal linas blunt lobes. Laaf-blades about 15 to 18 ceattoby 10 to 12 cent. (eny $6+7+3-4$ inches), neratly glabrous, rounded at the bace, oblong entire, startly and abruptly accminate, venation arcaate retien labe areole broadish, irregular, quarish, or oblank Upper surface of the mid-rib provided ness the base with a few linear, lanceolate, memornt deciduoun scales. Inflorencence axillary, shortaf find the leaver, cymosely branched, many-ilom fith pedicels spresding dichotomously, branched lill low minute bracteoles, ultimate pedicele fo milu cals rather horter than the expanded fower. of five apreading, ovate acate, shortiy actis 2 D green segments aboat 5 mill. long. Coroma ${ }^{2}$ im. 25 mill. diameter of five orate oblong, eleby bricate segments free nearly to the becoming buld externally rich violet within, becoming ith the

petals, deltoid acuminate. Filaments broad, waite, membranoun, infolded over the ovary, and adhering to the pentagonal diac-like tigma. Pollen-mases linear, club-ahaped, glandular at the end. Pollen granular. Ovary two-lobed, with a short atyle and large disc-shaped tigma.

We append a translation of Mr. Naudin's letter:"It is now some yeara ago that you sent me nome need of Chlorocodon Whitei. I duly raised them, one plant, growing on a wall, has become very tall, is many feet in height, and at the present time is covered with flowern and will probably prodace need. The heat just now in torrid, and the annahine of Antibes rivala that of Natal or the Cape of Good Hope. I thought that you would be interested in meeing a apecimen of my plant, and send you a piece of it, which I hope will arrive in a fresh condition. In the Botanical Magazine, t. 5898, Chlorocodon in flgared. The flower there are rather different in coloration to those on oar plant, which in atroparpareons, but without the yellow at the tip of the petals. Calorocodon Whitei is a fine decorative plant, is worth cultivating an a climber in any Orange-growing district auch an France and North Africa. Thas, it growe perfectly at Oran, whither I some time ago ment some seed to a plant-lover fond of acclimatising plants. Ch. Naudin."

## Polfpoditm (Phegopteris) Teinidadensis, Jenm.n sp

Stipiten, 6 to 9 inches long, void of vesture, alightly channelled, brownish-green; rachis similar; fronda pinnate, chartaceous, pale green, naked, 1 to 2 feet long, I foot or over wide, not reduced at the base and very alightly at the apex, terminating in a aimple linear-ligulate unlobed pinna, conform to the lateral ones; pinnw apreading horizontally, almost mensile linear-ligulate, 5 to 6 lines, width 9 inches long, finely serrato-acuminate, the base truncate, not widened, alightly contracted in the lower onem, the marging uniformly throughout sharply dentate (or bi-tridentate) ; veins copions, simple, clone, grouped, running to the margin, terminating in the serrations; nori copious, medial on the veing, forming two or three rown, no involucre observable.-Trinidad; communicated by Mr. Hart.
At first sight this might be mistaken for Polypodium flavo-punctatum, Kaulf. (Aapidiam rotandatum, Willd.), a plant very common in Trinidad, but which on comparison is seen to be very distinct. The pinnm are narrower in this, they are uniformly free at the base, alightly narrowed there, with a terminal one to the frond, aimple, only serrated, just like the lateral ones, and the translucent spots are quite absent ; whereas $P$. flavo-punctatum has pinnse twice or thrice as broad, with copious translacent spots, the upper pinna roundly lobed along the margins, freely translucently apotted, the apper twothirds broadly adnate and decurrent on the rachis, pasing gradually into the lobed aper of the frond, there bsing no distinct terminal pinna. Plumier's figure, Fil. $\mathbf{t} .38$, is a very good figure of P. flavopunctatam, and show clearly how diatinct thene two species are. G. ©. Jenman, Demerana, July 30.

## FOOD REQUIREMENTS OH THE TOMAT( CROP.

The Tomatos of present caltivation are all referred to two epecien-Lycopersicum enculentum, ambracing the great mase of varieties; and L. pimpinellifolium, the Currant Tomato. The former has two main typer, var. cerasiformis, the Cherry Tomato, and var, vulgare, embracing the ordinary market Tomato.
A moderate eatimate of the yield of ripe market Tomato per acre when grown out-of-doors in the Uaited States is 10 ton ; with proper management, 15 tons per acre are often secured. If planted 4 feet apart each way, there will be about 2700 vines to the acre, weighing, after the lat picking, somewhere about 8700 lb .
The roote, according to a single obwervation, will weigh about 1350 lb . Taking 10 tonas an average
yield, and "calculating on the basia of the figurea just given, a Tomato crop takee from the woil, in pound per acre:-

|  | In Fruit. | In Vines. | In Roots. | Total. |
| :---: | :---: | :---: | :---: | :---: |
| Nitrogen | ${ }_{28}^{2 b}$ | ${ }_{28}^{1 b_{0}}$ | $\mathrm{Ib}_{3}$ | $\mathrm{lb}$ |
| Phoophoric acid | 11 | 6 | 1 | 18 |
| Potash ... ... | 53 | 4 | 4 | 101 |

Dr. E. H. Jenkins, of the Connecticat Experimental Station in the American Agriculturist of May last, reckona that one-half of what is taken up by the plante from the soil is returned to it again in the vines and roots. That is, taking it for granted that these are returned to the land an manare. These fact furnish a general guide to the proper fertilisation of Tomatos. On the one hand, the aoil mast be expected to sapply a part of the crop's requiremente from it inherent fertility; on the other hand, by no means all of the coluble fertilizers applied will be available to the crop for which it in directly used. It is quite doubtful if more than a half or two-third of the applied fertiliser is taken up by the crop for which it is immediately employed. Lawes and Gilbert in their experiments at Rothamsted, reckon only about 40 per cent. of the manure applied as being recovered in the increase of crop the firnt year of ite application.

Owing to the immense demand during recent years for the Tomato an a market vegetable, the chemical composition of the plant has been thoroughly investigated. It appears that the Tomato is not an exhauating erop an compared with aeveral other garden products, always provided the haulm or it equivalent in manure is returned to the soil.

The percentage composition of ripe Tomato and of the vine after picking, calculated from all American analynev, according to Dr. E. H. Jenkinn, is given below:-

|  |  |  | Ripe Tomatos | Tomato Vines. |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | Per cent. |  |
| Water... ... | ** | $\ldots$ | 94.75 | 836 |
| Organic matter | ..0 | .-. | 480 | 13.40 |
| Mineral matter | .. | ..0 | $0 \cdot 45$ | 3.00 |
| Nitrogen ... | "00 | ... | 0.139 | 0.321 |
| Phosphoric acid | .0 | $\ldots$ | $0-057$ | 0.066 |
| Potash ... | ... | .. | 0.283 | $0 \cdot 69$ |

A asfe rule is in the firat plece to make sare of an excean of available potash in the soil by applying a potash manure liberally, and thil for two reasons. Firat, because the crop requires almost twice as much potash as any other ingredient; and, secondly, because nitrogen, the most expensive element of plant-food, can only have its full effect when available potah and phosphate are present in excess in the soil. Moreover, any excens of potash over the crop requirement will not waste from the soil by drainage, but will be retained in combination by the soil for use in future crops. The Rothameted experiment show that when potash is deficient in the woil, the growing plant, of whatever deacription it may be, becomes mach more senaitive to adverse conditions of aoil or reason, and is more readily attacked by dineane, enpecially mildew and other fangoid growth.

Wood-ashes contain a large percentage of potash, and where obtainable will be found an excellent manure for Tomatos, becanse not only do they correct any acidity in the soil, but they favour nitrification, and they apply carbonate of lime, of which a Tomato crop require at leant 50 lb . per acre. A small amount of available phoaphate will in most case be sufficient for a succensful Tomato crop.

Having made aure of an excean of lime, phosphater, and potash salts in the soil, nitrogen should be used freely, but economically ; a manll quantity given Irequently is mach better than a large dose applied sll at once. Whether Tomato are grown for retail market or otherwiee, it in very desirable to get as
early maturity at posable. Applications of aoluble formn of nitrogen, and particularly of nitrates, weem to increase the gield of frait without retarding maturation, and even hasten it provided there is sufficient heat at command. In various trials it has been found that the are of some quickly acting form of organic nitrogen with the more voluble ammonia or nitrate is anfest.
The New Jerwey Horticultural Station, as the reault of five years' exact experimenta, proposes the following general method of manuring for the Tomato. 1. Where land has been heavily fertilised or manured for the previous crop, apply evenly over the soil from 200 to 300 lb . of nitrate of soda per acre, one-half at time of eetting the plants, and the remainder from three to four week later. 2. Where the land is light and aandy, and has not been heavily manared, apply broadcaut, and harrow into the soil before etting the plants 500 lb . per acre of a mixture made up of two parta of auperphosphate, and one part of mariate of potash, and 150 lb . of nitrate of soda.
It mat be remombered that the foregoing suggestions are for Tomato crope grown out-of-doors, in a much warmer and more annny clime than our own ; they are given, therefore, not by any means as rules for Eaglish gardeners to follow, but as a possible help to the grower who ought to know better than any one elee what his noil needs, and in what it is relatively deficient. J.J. Willis, Harpenden.

## The Herbaceous Border.

## PENTSTEMON BARBATUS.

In point of besuty this plant and its varieties are some of the beat hardy perennials. The tall apiken of flowers of a rich ahade of acarlet are very effective when the planta are grouped together in a bed or border, and they continue flowering profusely for a long time. Indeed, it not infrequently blooms in early summer and in the autumn, and is therefore a good anbject for the flower garden. This remark applies to the beat forme of the plant, and not to the variously dingy-coloured varieties nometimes aeen in gardens. One of the handsomest form is P. barbatus Torreyi, a North American plant, with spikes of acarlet flowers, 4 feet high. Another fine form is $P$. b. antwerpensis, nomewhat taller than the former, also possensing acarlet-coloured bloswoms. A charming bed can be made of these plants and the white-flowered Tigridia grandifora, with a band of golden Viola for an edging, planting the latter amongat the Pentstemons in February or March. Theme Pentetemons are readily increased by divicion early in the year, or by cuttinga in the autumn; the former will generally be afficient for all ordinary uses, and the division aoon make atrong plants. Where large number of plant is needed, the young thoots at the base may be partly covered with soil, into which roote will quickly push. By doing this in the early autumn the plant will be well rooted for dirision the ensaing February; these would flower in the ummer following.

Spiret filifendula, fi-pla
In thia plant we have a perennial of eary culture, dwarf habit, combined with freedom in flowering, and neatness of growth. From a compact cuthion of Fern-like foliage isue a number of pure white flowers, arranged in corymbs, and they continue to push up for aeveral week in succeanion. The plant is well maited for growing in masees where an early summer dieplay is the aim. Though not usually emplojed as a pot-plant, it is neverthelese a very suitable subject, and it may be partly forced into bloom if necessary. Plants required for the latter purpose should, however, be potted-up in Augut or September of the preceding year. In common with other species of Spirea, it should be planted in a moisture-holding soil, and though succeeding fairly well in light soils in sunny spote, it is never quite satisfactory in them. The plant is increased by division performed in the autuma or apring

Plant it firmly in not over-large pieces, and unlest in a moist apot, divide every two years, to maintsin the atock of plante in full vigour.

## Spirifa venusta.

This is a beatifal plant for a moist moil, in which it alone will grow atisfactorily. If the soil of the garden is not naturally moist, this Spires should be planted in rather heavg aoil in a sbady apot. In a bogey situation it growa from 4 to 5 feet higb, and produces very large cymes of bright-coloured flowern, bat is of slower growth than most Spireas. Propagation is by division and seed, but for the former a large specimen is required, and by the latter method lame of the seedlings may be of little value, atill some bright forme may perchance be obtained. These seedlings should be planted, if posible, at the side of a stream or lake, where they woald make quick progrese, and at the same time economise laboar. In anch a position even the inferior varietiea would be denirable planta. J.

The Rosary.
TWO MODES OF MULCHING ROSES.
ThBRE are thone who would object to apply the term" mulch" to any wet anbatance, anch an sewage, manare-water, pond-mud, \&c.; the word uaually carrying the meaning of a coat of some loose, light, porous material placed on the aurface to arrest lose of moiture by evaporation, and heat by radiation a well. Bat in a larger wence we may malch with manare-water as well as litter. Even the residuum of the liquid manares or sewage may form in themnelves, or be made to acquire, mont of the physical properties of mulches through allowing them to accamalate on the surface, or much better still, loomening them up and mixing them with the earth benesth through frequent hoeing. In ite modent meaning, anything applied or done to the aurface with a view of adding to or holding more fast the moisture and food in, and keeping the heat or drought out, is a mulch, the more porous the more potent the mulch. And the efficacy of the liquid mulehes is doubled by atirring the surface with the hoe or acarifier, as soon as the aurface is sufficiently dry to allow treading upon it. I have been so fortunate as to have seen both these methods of mulching in active operation in this centre of the Rose induatry in the coarse of the past few weeks. If asked to asy which was best, I should prefer to answer, both. Few have uaced manare-water of all sorts-house and yard alops sewage-more for Rosep, than I have done, for many years in different counties with various soils, and such prompt-acting surface-mulches have been my chief mimulant for Ronen. There hes been, I trust, not a little mound science, asauredly mach useful nentiment, as well an auccess in thus converting and transferring sach dangerous anbatances into lovely Roses. Hence, on looking in at Mearr. Prior \& Sons' fow week ago, and finding them at the sewage again, I felt something like an old hunter on which I was mounted by the stud-groom in my younger daya by mintike, and which compelled me to follow the hounde for my first and lant ride almost at the head of the hounds, I sniffed the sewage from afar, and have seen and felt-mmelt-its results in the quality -odourr, and prizes received for thene sewaged Roues aiace I maw them get their last feast of savouries for the season a few weeks aince.
The cheapest and perhaps the best of all dry mulches is also in fall swing at Colchester, gangu of men are employed to maintain it in full efficiency. Rosarians have no faith in the robber malches of weeds, so popular among distressed cultivators of various worts. Such mulches live for themeelven alone, making poor sorts poorer, dry soils drier, reredacing the diet which should go to feed aeefal crops into amaller and yet maller returns. Whereas hy keeping the hoe and the searifier in active motion rsber-weede diamppear. The mtrength, mointare and food in the will are huebanded, the aurface proteeted
from cracking andirending, and fresh supplies of food and moistare brought up from lower deptha through uustaining the potent force of capillary attraction. At Colchester and other places the practical result of keeping a loose surface may be seen in ten of thousands of Rones that have withstood the drought without any other help from the cultivator, which look so vigorous and beantiful, as if they had all that the most ambitious Rose could desire.
Strawberries in many districts where the prodace is a record one this year teach the zame lesson. Not a few of the very finest cropn have had no water. But as a penny saved is a penny got-or more, so is every drop saved, conserved throagh surface mulchen, a drop or more saved. Fortunately for the Strawberry crops and plants it is not at all hard to maleh to keep the frait clean, and auch mulches, whether of litter, fibre, mose, atraw, chaff, tell later, and keep the roots cool and moist as well as the fruits clean-thas paying the caltivator compound interest on the labour and money expended on mulches. D. T. Fish.

## ALEXANDRA PARK, MANCHESTER.

This park is situated on the south side of Manchester, and is much freer from amoke and the noxious vapours which the moke canses, than any of the other parks sarrounded by the city. It is much more extensive, too, covering an area of 60 acres, which opens up scope for landecape gardening denign. In this reapect it seems to vie with mont othera in having apacions promenades and drives, cricket, football, and lawn-tennis compartments, surrounded on the margins with plantations of trees and ahrabu, which, when clothed with foliage, completely shat out the rather handsome villa tenements to be neen on two sides of the square. There are, in addition, avenues of trees, with alternate green Hollies between, to brighten up a little the winter aopect; and then the crowds of flowering shrabs, commingled with, and confronting the deciduous trees, together with the patches of annaals that give forth their flowers in summer and autumn, make altogether a very pretty picture.
A apaciour entrance gate, with auitable lodgen, has been erected, and to the right you face an avenue of Limes, something sbout 700 yards long, verging upon a apacions artificial lake, and right in front of you is a raised terrace in which there is ample acope to practice in no end of designs of aummer and carpet bedding. The promenade between this is a apacioas one, asphalted, dressed and arfaced to please the eye, and is of considerable breadtb, to that treading on the grass is teldom, if ever, resorted to. What struck me particularly was the capital order maintained, showing no stint of want of keeping, and the eje liner, whether straight or on the terrace promenade, or of sweeping carvature, as alongside the walke and driven, were anexceptionally pleasing.
The principal trees doing bent here were the Limes, 2 tree which you will hardly see in 2 decent atate of bealth in any of the other parke; the Aoh, of which there is $\approx$ fine avenue here, but being planted too near the Limes, they are andly encroaching one on the other, and thum apoiling both. The Syeamore in doing fairly well, but is subject to rast in its early stages of growth. Other trees, such as the Thorns of sorts, particularly the plain-leaved Thorn, is as good as can be. The Rowana make capital companion low-growing trees, and are now covered with multitudes of their scarlet berries-a great temptation to youngsters, as well as blackbirds and thrushes ; meantime they are loaded, and give a brilliancy mont desirable indeed to the mixed border,
Another capital fellow-tree to the two previouslynamed families is the Service-tree, only in summer its leaves get blackened with moke; in apring, there is no better wind tree, in respect of showing its hoary underneath warface. Young's Weeping Silver Lime is in quantity, and a most beautifal tree it is for individualising in a park; ite great leaven, twice the dimentions of thote of the type, are alno white underneath, and look nicely in the distance
ander the influence of a breeze. Weeping A Ah alto do aplendidly-indeed, all thene pinnated-leaved treen and shrabs help to cast a dash in a sombre landecape
Foremost among trees of a suffruticone character, not often seen aboat towne, is the Samach (Rhu Coriaria). It grand pinnated leaves, like grou Fern fronds, atand out in relief, and how aplendidly it does here planted out among ash-gray rocks! If shoots out in all directions, coming up from the running roots as they meander among the atones, If is much ased, commercially-apeaking, in the dyoing industry; its leaves are collected when growing, then dried and ground. The Sicilian Samach is the bett for dyeing, containing about 20 per cent. of tanner's mation, It nhoots far freer even than Berberis aquifolium, xel a most beautiful patch it makes allowed to take it nataral courae from the main stem. The S apprintendent deposits lots of plants, and nets them dom throughout the mixed tree borders. Robinia pund. Acacia is also doing well in standard. Rhama Frangula, although it requires support, makes a good sabject, becaune of the yellowish-green of ita lesm contrasting well with other decidnoas treen. The Cstalps is doing in sheltered positions, and wo is the Salisbaria adiantifolia, with ite deeply-cut, irrealiaroutlined leaves. Those purple-leaved treef, nechu the Beech and the Plum, do not stand out oner mental throughout the year, and have in early autamn a sombre, dying aspect.
The shrubs that do best are the Rhododendron, firat and foremost among them for border work in Canningham's White. It is as hardy as Couch, and in bristling with buds. All the Ponticama, and may of the earlier pushing hybride have anffered from tho sharp frosts of mid June. The leaves are as if bronnd in the middle, green round the margin-it in jut possible many of them may die off as the vewon ripens growthe up. Wherever they have been planted in exposed positions, the wind and the fork together have played and havoc, always barring Curningham's White. Andromeda floribanda it als indiapenasble town plant, and so is Skimmis oblas Really these two plante seem to defy amoke and frow down towards zero-the lowest reading here was 20 and $3^{\circ}$ of frost; of course, those Azaless which brighten borders with their flowers in apring wad their leaves in autamn, are largely grown, and mall they do. Berberis japonica is worth making ' special note of, it is good looking to begin with and is much hardier than the common Aquifolium.
These mixed borders are composed largely with unch ornamental plants as Snapdragons, Centarres, Sweet Sultan, the Summer-flowering Caryanithemum, the Shirley and Iceland Poppies. The latur are by far the most useful, as they are not al lagbcione as the Shirley, and they keep longer when aith The Helianthun in meveral varieties are usefal, tall wart plants, the aewer forms of them barting outh and flowering freely, although their flowers are ant so large. The largeat one is a capital fellow for tio Japanese Auratum Lily. Tobacco-plante, too, unthe aplendid farnishing for mixed borders, becaute of their elegant habit, and large light-green leaver. 0 ow of the most atriking beds in a dotached ponition os the grasay parterre was one of seedling Antirntio nume. Nothing wes more captivating in the parkin becanse of the great variety of coloure, challengime the rainbow in fact, and the dwarfness and come. pactness of the strain. Pentatemons, too, dealt in this way were effective. Carnations, singular to say, were nearly all killed of last winter; frell relays have been planted. Clematio Jackmanin too, in very prolific of flowers, and makes fine con trasting plante to others; it is always beantifal whin the green grass, and it is green and lovely in wimgo park, too, wo clonely is it clipped with the mom thin machine. The Rosary has been an access then season; the plante do well in the preerm enclosare.
The summer bedding is one blaze. Ose mild condemn it as too formal, but when you nee an variety which we have deacribed sbove, there is ill at for this class of ornamental gardening. If will do to abandon it altogether; the people sboun the
delight in a maes of gandy colours, and then
informed of them look apon gardenere who do not make a thow of this kind in the parka for which they are practically paying the up-keep, at unfit for their work. The great breadth of beautifal greenery as a groundwork here show: up the deaigns to great advantage. It might be aa well to give the names of a few plante and varieties that were doing waperbly -Cryetal Palace Gem Pelargonium was particularly effective and free in habit; Venuvius atill ranke high among bedding carlets; Mre. Fenn is of a fine
is telling among other subjects. Lobelise in wet malest seacont, are apt to run to growth without producing flowers. The velected one here, named Royal Blue, is a gem for ita indigo tinta and for its pro fasion of flowers, this mixed with and surrounded by Centaurea ragusina, Kept the eye on it-the ioftness of the grey and the brilliancy of the blue being quite eye-pleasing. A most effective combination here is the usual Calceolaria and Pelargonium, then a great broad band in front of Gageana splenden variegata
planted out. This abow what a labour proper flowergardening require.

Bat carpet bedding, to do it well, requiren ten times more work, although the material may not generally require the mame winter "coddling." There are some pretty bite, chielly ranged along the promeande, of this sort of work, and the weaving of it together involven akill to begin with, and time to finish. It does not do to make it too quat. The prettiest bit of bedding was where the thistle-looking Chamxpence diacantha was dotted down on a groundwork of golden Lyaimachia, and varied Sedume, with dot plant of Echeveria Peacockii. The Gnaphaliam lanatum, the deep olive-green Herniaria glabra, various Meembryanthemume, Stachys lanata, and the Golden Thyme, were all in use in more or lest designs, and these thing arreat the atiention of the viaitors. If anything, the bed were tso quat; some relief would have been desirable, particularly in the centre of the various designs, with Agaris, Aralias, Centaureas, or sach-like individuals. As it was, it was one sheet of colour from end to end of a parterre quite 500 yard long, bat fortanately the bed were broken in their outline, relieving geometrical outline formality.

Tae bowling-green is largely taken advantage of, and is nicely adorned with sloping banks, their tipa filled with miacellaneous flowering plants, and there are naitable band-atands and abelters, and gymaaticgrounds for boys and girls apart, the whole ander the auperintendence of Mr. Henry Crosm, and in firatrate order of keep. Viator.

## PANDANUS VANDERMEERSCHII.

The accompanying illustration (fig. 46) represent. a plant of the Screw Pine, Pandanus Vandermeerachii, in frait, growing in the lalm stove bere. It in 13 feet high, with two side-branchen each extending to about 8 feet from the main stem. The frait are borne on the side-branchen, and are of a trigono-globone shape, 0 iachen long and 8 inches in diameter at the base. The fruit firat made ita appearance in July, 1894, and as yet shows no signs of ripening. $A s I$ am led to believe that the fruiting of the Pandanus in this country is very rare, perhap this note may prove of interent to your readert. Thos. Wilson, Glamis Cautle Gardens.

## WISTARIAS.

The genua Wintaria is one of a great number showing the close relationship that exista between the flora of North America and that of Northern Ania. Of the species known, one come from the United States, and the rest from China and Japan. The generic name (sometimes erroneously pelt Winteria) wa given in honour of Cappar Wistar, an American acientint, who flourimed about one hundred years ago. The specie vary in habit, from shubs of comparatively dwarf atatare, to atrong-growing climbers large enough to envelop big tree. climber ever introduced has served its purpose better than the common Wistaria, the flower being unsurpansed either in beauty or abundance, and the plant itself being of exceptionally vigorous growth, and quite bardy. It is undoubtedly the fineat of all the Wistarias; bat the other species Hower at a different seamon, and they have afficient merit to make it worth while to pase the genus in review, eopecially as they are but little known in gardena. Botaniat differ in their estimaten of the number of species in the geaur, but there are at least threechinensis, maltijuga, and fratescens-whose idertity is well entablished, although Mr. Hemsley places multijaga ander chinensis. Two othern-brachybotrys and japonica-are figured by Siebold in hie Fhora of Japam, but they are scarcely known in garden, and the latter is now looked opon an a Milletia.
W. chinensis.-This fine pecies was introduced from China abou: the year 1816. There is no hardg climber in English gardena that attain to olarge a wizo at this, specimen being mot ancommon whote
roseate bue; and Henri Jacoby is a large brilliantruis; Master Cariatinp, a telling pint; Violet Hill, aleo, is a fine nosegay Giranium. Among Golden Bronz, there was nothing more-if, indeed, so effective as Mra. Quilter; the habit is dense, and the leaf is the perfection of form, whilst the coloaring beat mont of the older ones. Marshal MacMahon is aneffective bronze. There were many other, but these were the cream of the group.

Among Violap, the bet atanding of the violet colour is undoubtedly Blue Perfection. Moat Violas in dry weather curl up their flowers; thim one in leate affected in that way, and ite colcu:
mixed with the prolific-flowered blue Lobelia and edged with Echeveria. The orange flowers in day time reating in the green and white leaves of the plant, and the blue and the other primary colour told exceedingly well withont being out of colcur and in bad taste. Yellow is an everpleasing coloar, and should be sparingly uaed in all flower garden combinations, the denigner here had evidently his eye apon that point in planniag his arrangements. A few beds of Harrison's Musk atet among parple leafage was highly effective-it would have been more so but the Irealne whe not up in colour, neither were the Alternanthera*, which are lean even than when
branchen have a spread of 200 feet to 300 feet. Its rigour is equalled by it floriferonanem, and a fine specimen in flower is one of the most beatiful fioral picturea an Englinh garden can show in early summer. The leaves are of a pale green colour, and conaist of nine or more leafletm, which have a few flattened hairs scattered over the upper arface, but confined on the lower aide to the veinn. The flowers are borne in racemen, sometimes conniderably over 1 foot long; they are large, papilionaceous, and of a pale bluish-purple, fading off to almont white in parts of the flower. Grown in tubs as a standard, this Wiataria may be ased for spring-forcing in the greenhouse, praning back each year after flowering. Oat-of-doors it may be used in a variety of ways. It is admirably adapted for covering walls, pergolas, arbours, \&c., and may aleo be planted so at to climb over treen that can be spared for the purpone. There are now neveral varietien of thir plant in cultivation. Var. flore-pleno has double flowers; alba is white, and is also represented by a doableflowered form; var. macrobotrya has flowert of a paler shade than the typical form, but its chief dintinction in in the long racemen. There in also a form with variegated leaves; bat, with the exception of the doable-flowered variety, which remains longer in bloom, the typical old plant is the beat. The white-flowered varietie are beautiful, but do not flower so freely.
W. multijuga. - In the Index Kewensis, this plant is referred to an W. ninensis, but from the point of view of horticulture, there can be no doubt as to the desirability of keeping ap the present name-indeed, this is done in the recently-publizhed List of Hardy Trees and Shrubs at Kew. It is not of the same value as $W$. einensis, but it does not come into competition with that apecies, an it flowers two or three weekn later. It was introdaced from Japan about twenty years ago, and being frequently met with there in a cultivated atate, was for long considered indigenoul to that country. It in now thought to be moat probably a native of China or Corea. The character which, besides it later flowering, distinguishes it from W. sinensis, is the extreme length of its racemes. Ordinarily, these are at least 2 feetlong, and the Hon. W. F. D. Smith, at the Temple Show of 1894 ahowed racemen a yard in length, grown in his garden at Henley-on-Thamea. The fower differ also in being more aparsely arranged, in having aborter pedicels, and in being maller. In colour they are most frequently a blend of blae and white, the proportion of each colour varying in different plants; there is one variety, lnown as albs, with flower wholly white. The leave are more nomerously divided than in W. chinensis, and the leafete, which are smaller, are bright green, and glabrons on both surfaces. Ia thi country, at any rate, it doe not fower 0 freely an the better-known speciet, and where apace can only be afforded for one of them, it ahould not have the preference.
W. brachybotrys.-It is doubtful whether this plant can be admitted an a distinct epecies. I have not seen it under cultivation, but judging from the various figures that have been published, it is, mout probably, a form of W. ehinenis, which is now Lnown to be aative of Japan an well as China. Siebold discovered it in Nagasaki, and figured it in the Flora of Japan, t. 45 Is wen introdaced by him to the continent about 1830, and fowning subsequently in the Botanic Garden of the Uaiveraity of Gnent, was figured in the Flore des Serres, t. 880. Although met with occasionally under cultivation in Japan, Siebold observe that he saw it once only in a wild atate, and then in a sot where it covered the whole nide of a hill. The fuwers are produced in April in racemes that are much ahorter than thowe of W. chinensia; they are of a deep purplishblue, and mingled with the tender green of the folinge, are very effective. The folisge is like that of W. chinemais, but the plant in dwarfer.
W. japonicu, yy. Nilletia. - This apecie is scarcely known in this country outwide botanic gardeur. It wan found by the Kew collector, Richard Oidham, in
Nagnenki, Japan, in 1862 , but, had previouly Nagaraki, Japan, in 1862 , bus had previously beon
known to Siebold, who figured it in the Flora of Japan, t. 43. In the accompanying text, he aya "the clustern of white flowerk hanging from the tops of the buahes and trees form a magnificent aight, giving to the vegetation an aapect of wild beauty." In apite of this, however, it can only be described as one of the least ornamental of Wistarias. The racemes are amall, as are also the individual flower compared with those of W. chineasis. It flowera in July and August.
W. frutescens.-This, as before stated, in the one species found out of Asia, being a native of Florida and other sonthern United States. It is a climber like W. chinensis, but is not so strong a grower. The leave are of a rich bright green, with the leaflets not so numerous as in W. multijuga. The under-nurface and the midrib of the leaf, an well as the joung branches, are covered with down. The racemes vary in size from 3 inches to 6 or 8 inches in length, the flowere being a pale bluish-parple. There in, however, a white-flowered vaiiety, and also one named magnifica. The latter has racemes sometimes more than 1 foot long, and an deacribed by American horticalturists, is a mach aperior plant to the typical form. It flowers later, and is, on the whole, well worth cultivation as an ornamental c'imber. In the racemes of $W$. fruteacens the flowern are much more closely packed than in the Asiatic species.

Little need be aid in regard to cultivation. Wiataria are amongat the most amenable of hardy plants, thriving in any soil that is of fairly good sabatance, and moist. In the early stages they may be helped by top-dresning of manure applied in apring. When planted near trees over which they are intended to climb, a large pocket of good loam ahould be provided, and they mould be planted in auch position that light and rain can reach them. Some fine effects are prodaced in Mr. Anthony Waterer't nurwery at Knap Hill, where Wistaria chinensis hae been allowed to clamber over Pine-trees and Laburnums. In the latter case especially, the aimultaneous flowering of the two things, and the intermingling of the yellow and purple racemen, make a beartiful pictare. All the apecie may most readily be propagated by layering-seeds being only produced in years of exceptional brightnem. In 1893, for inatance, W. chinennia ripened a fair quantity of aeed. W. J.B.
BOOK NOTICE.

## Manures and their Appligation.

In no department is the average gardener more deficient than in the knowledge of manare and their proper application; we, therefore, welcome a ureful and cheap little treatise apon thia important subject by Mr. W. Dyke,* which is, in fact, the abatance of a lecture delivered to the Cheshant, Wormley, and Diatrict Horticultural Suciety, May 9, 1895, but revised and given in fuller detail.

Tae suthor does not claik that there in anything new in hin little work, his idea being to give to those whome duty or pleature it is to cultivate the coil tome idem of the different kind of manare in ase, then action when applied to the soil, and the quantity likely to produce the best reaulti generally.

It is wonderfal and inatructive to see to what nice shadinge of adaptation this preparation of food for plants has during recent years been carried. Here is a soil, rich in organic matter, on which we winh to raise a crop of flowers or frait, but because of the very abandance of organic matter, there will be an overgrowth of wond and foliage-a splendid thow of greenery, but little blowom or frait. We ask, throagh the agricaltural chemist, what the trouble is? He thow un that potanh enter largely into the fabric of the wood, and phonphoric acid largely into the formation of the fruit, and it is matnration 10 ware after. S, we give the plant a food containing 10 or 12 per cent. of moluble phomphate, with a

[^15]liberal amount of potash, and the tree or flowering plant gratefully responds to our thoughtful kindnen in asking it what food it needed or preferred.
The pamphlet before us will anaist the practical gardener in his study of manures, as to what they are and what they do. It is divided into two lee tions, ander the heading of "General Manures," thone which contain all the ingredient required by plants for their nutrition; and "Special Manares," thone containing one or more (but not all) of tha necessary constituents of plant-food.
A few corrections in the work are neceasary, to which we should like to call attention. The poisonous element in malphate ammonia is nulpho. cyanate.
The quantity of nitrate of soda recommended to be applied is from $1 \frac{1}{2}$ to 3 cWt . per acre. This wo consider is too mach for most garden producti. From $\frac{1}{2}$ to $\frac{3}{4} \mathrm{Cwt}$. per acre is as mach as the majority of garden planta can take; otherwise quality is acrificed for quantity. The keeping quality of Onion is greatly deteriorated by large dresaings of nitrute soda. Soot in a very variable manure ; it contain bat little nitrogen, and from 1 to 4 per cent, of ammonia.
Blood, after being dried, in a valuable manure ; it contain from 78 to 79 per cent. of organic matter; 7 to 9 per cent. of ash ingredients ; about 12 per cent. of nitrogen; from 1 to $1 \frac{1}{2}$ per cent. of phor phoric acid; and about $\frac{3}{4}$ or 1 per cent. each of potash and lime. From some carefully-condactad experiments in Bulgium by Professor Petermann, it was found that the fertilising power of nitrate of mods war greater than that of dried blood, and expecially so on light land. According to Petermann's resula, by far the best remult with dried blood were obtained on clayey soil., whether the manure wal aned alone or in combination with phoaphater and potanh.
The quantity of nitrate of oda recommended for lawas, 25 per cent. of the mixture, is certainly all excess; if more than 5 to 10 per cent. of nitrate soda is uned in a lawn mixture, the coarter quality of herbage will be found to come too prominently forward; and as the lawn will require under stimu. lating dressings of manare more frequent catting, deterioration and exbastion will the more quickly follow.

OUR POULTRY.
By Harrison Weir.
(Copyright,)
(Continusd trom p. 40)
In my last I note an omission. Speaking of the Langshan, three words have in nome way bees omitted. The sentence ahould read "they are excellent layers, the egge being of fair siz'," \& As stated, the black variety is the most common, though there is no reason whatever why other coloura abould not be produced, though the Langatal Club has, I think, very anwisely given its opinios that any other colour is not desirable, nor can anch be of the true breed. I remember yeart sgo seeing among a lock of Rooks two pure white birds; would the committee of the Langehan Clab have the hardihood to say that these were not true bred Rooke or white Biackbirds, which are not very uli common, were not trae bred ousels. In breediot snimaln or birds, enpecially thone entirely domestic, white or blue ia by no means an unnatural subutitute for black, and therefore to my thinking, it betrigis very narrow-minded conception of the breed of variety of fowls called the "Langehan," when it is asterted that only the black variety are the tree, while the white or blue are decided by the clab to be cront-bred. In this matter, I entirely differ wim the committee of the Langahan Clab, of which I II an honorary member.

Again, I most eriously differ with them when ther atate in their "points of excellence," chat the plamise should be "tight." I have paid great attention to the peculiar style of thene birds ever since they were first imported by Major Croad in 1872, and by otress afterwarde, and I am bound to may that I have seve
seen an imported bird "tight-feathered." So ne have been what is termed close-feathered, which ia a very different thing. The Laggshan Clab also insist on 1 og legu; this is also contrary to my experience of the imported birds, as is also that of being long in the back. Ia fact, the Club hat materially altered the ahape of the Langahan for the worse, both in appearance and atility, the longlegged birds being moch later in coming to maturity than the short, mare, compact, or even medinm-legged breed, of wich I have kept many, bred direct from imported birds; therefore, if any of my reader feel any inclination to keep Langsbana, I would most mbongly advise them not by any means to purchase any of the atork-built sort; melect the short,

They are mont excellent forager when they have the opportunity, and range far and wide, "keeping about" until long after andown. The principal fault is, I think, their being feather-legged, which in rather prejudicial when the grase in long and wet, though they are leas injured in this way than nome of oar Eaglish breed. I am most decidediy of opinion that this breed would have taken a very mach higher position and hold on the pablic eatimation if it had not been for the course taken by the Langaban Clab insisting on the long leg, the long back, and the tight feathering worn, of which points the best imported birds ponsessed; nor can the majority of poultry-keepers be pertuaded that very long-legged bird are either proficable, uneful, beau-

Fig 47 -lelto-cattleya fowlbri: rost-lilac; lip rict cbimson perple.
(sEE P. 192.)
square-built forme, which not only are better table fowls, being finer in the fibre of the breast-meat, but they are also better layers, and the eggs are generally more fertile. I have taken much pains for many years in inupecting the atock of imported and imported-bred bird bolonging to Misis Croad, of Poling, near Arundel, and have found these the mont detirable, in comparison to those recommended as the proper size and form by the Langehan Club. I have noted also those Langahan imported by Mr. Thompson, and of late have ween the stock of Mr. Lambert, also bred from imported birds.
The Langahan, coming as it does from a someWhat cold country, is naturally very hardy, and is a mont excellent winter layer, ${ }^{3}$ o that the chick with proper attention can bo eavily raised in the early part of the year; or, if necesaary, in the latter part, wo as to have carly or apring chickenn of good ize and quality.
tiful, or elegant. As I have aid before, do not have the long-legged, stork-like "election."

There is another Asiatic breed, erroneonsly called the Cochin, inatead of Shanghae, which is it proper name, the breed being unknown in Cochin-China. This is a large, coarse bird, and now far too much bred for feathering, without any reference to usefulnew; snd though such is the care, it must be admired as almost " work of art," so wondrous is the fluffinem, length and lightnean of the plumage, the beautiful baff colour that have been obtained by carefal matching, and for their beanty unsurpassed, while the leg feathering is produced in ach quantity as to almout hide the shape of the lower part of the body; but thi has not been obtained without macrificing some of the mont valuable qualities it previously posseased, not the least of which is its excellence at a winter layer of highly-coloared eggs in quantity, it having been not infrequently alleged
that some of the hens would lay two eqge in one day, or rather three egge in two days. Now after b-ing made a bird of "mostly feathers," the production of egge is by no means equal to that of many other fowl.

Though so beantiful in colour as the "pupas fawn" now is, the fleah is bat of poor quality, and loag in fibre, bat juicy; the akin coarse, thick, and yellow, the fat of a golden yellow and somewhat oily, which is generally found in abundance in the abdomen, tometimes to the weight of three to four pound in very large fowls; the beart is long and thin, and by no means flechy; the wings also are small, while the thigh and lege are of extraordinary eize, and fall of mucle, but by no means dry or sinews; with some the Shanghaes are in favour as large-sized table fowls, while with other they are beld in little or no esteem. Bat this hes not been always the case, for on their firat importation about $184 \%$, column were written in their favour, not only an egg producers, bat as large rich-flavoured juicy table fowls, though the genaine epicare never conld dincover in them anything meritorious in this respect, but predicted that the crossing of these with our Eaglish birds would result in mach deteriorstion, which prophecy hav, unfortunately, proved correct.
(10 be continued.)

## PRESTON MANOR, BRIGHTON.

Witain the memory of the prevent owner, the time was when acsicely a carriage came within Bubt bat which wan bound either for the manor or a neighboaring eatate; now a frequent bus-service passe the gater. At that time, strangers in the neighbourhood were objact of carionity-now the thousand of visitor and excursionist who flock to the fine ground of Preston Park and gardens (once part of Preston Manor), maks stranger a part of the surrounding, at times perhaps too evident, but the $£ 50, C 00$ or 10 which the owners of the Manor House had for the portion forming the beautifal pablic park should afford, at least, some solace for their invaded privacy.
Approached by a short drive beneath atately old treep, the mansion, standing on rising groand, present ite old-fabioned front, which in not remarkable for architectaral beaty. The other face of the bailding, to which a tower has been added, and which is clad with Iry, is very quaint and pretty, and atanding on the terrace a very charming garden-acene presente itself. The whole of the centre of the view in of verdant green lawn, to the left is a terrace with beds of scarlet Pelargoniam edged with blue Lobelias and of other bright flowers, the background being an IVJ-clad wall above which rears the quaint old tower of Preston Charch, which is also covered with Ivy, and fianked by ornamental trees, a bank of Yewe and Eaonymus forming a base to the tower in harmony with it and the other objecte around. At the end of the green-ward rane beds of flowert, and on the right the pretty walled-in gardens, in which are mingled fruits and hardy flowers, after the manuer of gardens in the olden time, and which it is the delight of Mrn. Macdonald to maintain. Here are Apple, Pear, and other fruit treen, some of them perhapm a good deal behind the timen in quality, bat beautiful neverthelese. Beside the grasy or gravel walke which here and there internect the gardens are numerom clampe of Rowes, "ancient and modern "-aingle and double; masses of perennial Sanflowers, eingle and double; Phloxes which must date from the very earlient crosee of the apecies; long atretchen of Lily of the Valley, beantifal and fragrant in their season; and of Violeta and other fragrant flowers, and among them patches of anuuale, which help to make a brilliant display. Among the shrube, Calycanthus prsecox is in bloom, and the Weigelas, sce., very pretty and effective.
In one of the sheltered gardens a large quantity of grand plante of Richardia athiopica (Arum Lily), some of which have ten or twelve crowns, is planted out, and a fine lot of neat plant of Azalea indica are well set with bud.

The glas-house are in keeping with the rest of the garden, bat of them it may be aid that more modern atructares would be an advantage. As it in, in the hands of Mr. H. Naylor, the gardener at Preston Manor (formerly with Mr. Beckett, at Aldenham, and $\mathrm{Mr}_{\mathrm{o}} \mathrm{H} \cdot \mathrm{ll}$, at Lord R thachild's), the best that is is ponsible to malke of them is assured. In one of the vineries is a good show of taberous Begoniar ; in another house a fine dieplay of zonal Polargoniams, the grest bashes of P. Raspail having b:oomed from lati antumn antil now, and are atill good.

A little house of Maidenhair Forna has the walle covered with Ferns, and is a very pretty object; and in other honges and frames are a fine batch of Taberosea jnst coming into bloom, and varioue other thinge for autunn and winter flowering.

Somehow, there is a charm about thene oldfachioned gardens, and an interest in the plants in them, which is lacking in modern, and what are called well-kept gardena.

## CLIMBING PLANTS AT THE abbey park, LeICester.

The caltivation of a general collection of plants under glass is not an objuct at these fine pablic gardens; bat the winter garden, in which are some oplendid ppecimens of Diacæera australit, has a good selection of greenhouse climbers its roof, some or other of which are in bloom all the year round, and are apecially $u$ afofnl in assisting in makiag an effective display when the houne is arranged with the 2000 or so specimens of Chryanthemums which Mr. Bura grows for the purposa every year, and which, with the retting of drooping climbers overhead, and the graceful heada of the Dracænas among them, present a far more beantiful appearance than do mot other arrangementa of Chryasnthemams.

At the time of the grent flower show (Auguat 6), more or less in bloom on the roof and pillare were *everal kinds of Pasaifora; Lonicera wempervirens, Clematia indivisa lobata, Trachelospermum jasminoides, Swainonia galegifolia, and S. g. albz, Tecoma jasminoides, the charming sky-blue Plumbago capensis, and the white P. capensis alba, with large bouquet-lize heads of bloom; Coboes scandens variegata, and the bright-blue Sollya Drammondi, a very pretty old plant, but rarely met with now.

## ABNEY HOUSE, BOURNE END.

TER pretty river-sids renidence of Misa Hammersley, on the banks of the River Thames, about midwas between Maidenhead and Great Marlow, is wall known to frequenters of the district, and the well-kept ground form a noticesble feature to plearare-reekern. The house itself, or, at least, the whole of the south front and roof, has been, until quite recently, covered by a fine apecimen of Ariatolochia Sipho, the handaome foliage in the summer making it an object of great beauty. Alas! it is now dead-from what cause seeme uncertain; but the flooda of November late, which almont reached the plant, and must have saturated the soil about the roote, followed by the mevere winter, weme to be the probable cauce of the loss of this fine specimen.
The pleavare-grounds are not very extensive, and Conifers generally do not flourish, although there are some healthy Sequoia gigantea which seem to like the moist aituation, and are fast growing into good apeciment. Begonias were the mout attractive fantare of the bedding, weveral bedm being filled with diatinct coloura, flowers erect, and one mass of bloom. The atrain is Owen's Ioperial, and it is one that in well adapted for bedding-out purpouen.

The glasthonnes are numerous, the most conmpicuous being a fine orchard-bouse, which really
promptad the writing of thene notee, prompted the writing of there noter, Having reen the excellent dishes of fruit ataged by Mr. Goodman, the gardener, both st the Maidenhesd and Reading atown, in past years, I called recently theuse being quite in the above-named orehardhouse being quite in the locality. It in a seman-
roofed atructure about 120 feet long and $\mathfrak{0} 0$ feet wide, running north and south. Inside there are three beda, one on either side and a central one, with a path running round about 6 feet from the nidea. The treen on the east border are planted out and trained about 12 feet up that side; the remainder in central and went borders are bush trees of Peaches, Nectarines, Pams, and a few Pears growing in pots plunged in the noil of the borders. From there trees abundant crops of fine fruits are annually taken. The pota are perforated ones, mostly of $1 t$ inches in diameter, and the roots are allowed to work through the holes in the aide into the anil. Fur some years past they have been annually lifted bodily (at praning time), nearly all the roote cat away that have passed through the sides and bottom, and replanged, adding a amall quantity of newly-prepared soil around the siden to encourage fresh root-action. They are not taken out of the pote. Great care is alao taken to keep the soil moint at all timer, a mont efficient water-aupply being laid on, and water is earily and quickly applied by means of a hose. Frost is not excladed, and although the house in fitted with two rows of 4 -inch hot-water pipes, the water is run off, and fire-beat is not applied uatil after the trees begin to move in early apring. While the fruite are welling, the trees are occasionslly fed with dilated sewage, used in a perfectly clear state.
Many varieties of the Paach are grown, the earlient to ripen being Alexander and Waterloo, which are followed by Amvden Jane and Halea' Early. Sume very heavily-cropped trees were Dag mar, Condor, Crimson Galande, Dymond, Sea Eagle, Nectarine, Princens of Wales, and Osprey Paches, and of Nectarinep, Lord Napier, Hamboldt, and several of Rivers' Seedlinga; Hamboldt is an enpecial favourite, and pats on a beartiful coloar. Some splendid samples of Plams were ripe: Oallin's Golden Gage wan apperb, also Kirke's Bille de Louvain, Jeffertoon, and Belgian Parple. Some 600 dozens of good densert Peachen and Nectarines have most years been gathered, bevides abundance of Plums, and the whole forms one of the most saccessfal examples of orchard-honse calture to be found in the country, of which Mr. Goodman may well feel proad.
In a greenhouse I noted a fine plant of Buagainvillea glabra trained under the roof and flowering most profunely. It was planted in a box in a mall house adjoining (in which Eucharit plants are grown), and the rods taken through the brick wall into the cool greenhouse, where it annually prodacea an abundance of its bright floral bracts.
The kitchen garden was looking remarkably well, and vegetablea generally are well grown. I noticed mome wonderful amples of Ailsa Craig Oaion, which should find a high place on the exhibition table later on; while Peas, Beans, and Canlitlowera, were well repremented, notwithatanding the drought, an anlimited water sapply at high presure being within reach of all parts of the garden from stand-pipes fixed at regular intervals. $C$. $H$.

## Variorum.

The Cultivation of Bananas - The Banana is becoming a regular article of con. samption in Earopes and large quanticies are now shipped hither, principally from the Aatilles, where this fruit is cultivated on a large scale. It has always been in great request in the Caited Staten, and, judging from the quantitien now to be neen in Eagliuh fruit whops, it will soon win ita way to public favour here in the same way that the Tomato has alresdy done. There is an immenae Banana plantation in Cabs, covering an srea of 00 square miles, and in it 3,500 permona are employed in cultivating and gathering the bunches of truit produced by $2 \frac{1}{2}$ millions of treee, the tranaport of which has necenitated the creation of a fleet of twenty-vix steambosta. From Jamsica, where the Bunana tree has almost entirely taken the place of the sagarcane, Buranas are now exported to the annual value of about £400,000; and at Hondura, Consa Rica, and the Hawsiian Islanda, their cultivation is extending more and more. Ac Conta Rica alone, there are already
about 350 plantations, containing over a million treen, It is a very lacrative industry, and is conducted with a very mall outlay in the way of working expenten, a damp soil and plenty of irrigation being the two principal requirements. Nine monthe after planting the young trees begin to bear, and from that time forward a certain number of bunches may be gathered almost every week, the reproduction of fresh trees going on continually in the mantime by means of numerous shoots and off sets. The cropi are very abundant, and a grove covaring, asy, an ares of 1500 sq sare yards, will yield from 6000 to 8000 banches in one year. some individual banches being worth from $2 s$, to $2 s, 6 d$ a piece. The froit when gathered is carried on rails to the nearest port of shipment, and taken on board steamers of aboat 1000 tons capacity, and each one capable of containing some 20.000 bunchen. Beeides being consumed in its nataral state, however, a very excellent flour is also made from the Banana in many placen, by desiccating the froits after depriving them of their aheath, and 今̂hen redacing them to powder. Thin delicious little comestible, indeed, is the object of a mach more extensive trade than is, perhaps, conceived by occasional consumers of it in this conntry. Western Morning News.

## Tha Waek's Work.

## PRUITH UNDER GLABs.

By Ricia md Parker, Gardenet, Goodwood, Chichester.
PINES - Suckers that were recently potted will be making roots, and care will be required in order to maintain the noil in a fairly moist condition. More water than is necessary is dangerous, as it may caue the base of the sucker to decay. Syringing overhead mast also be done aparingly, to prevent moitture collecting in the centre of the plants. Should bottom-heat decline below $80^{\circ}$, the planging material *hould be rammed together firmly, and freat tan or leaven added to raise the temperature to $85^{\circ}$. Oaly nufficient shade should be afforded at mid-day to prevent the leaves being scorched, reducing it gradually, so that by the middle of next month, when the planta are well rooted, it may be dispented with altogether. It is not too late to put in ancherr if aufficient were not forthcoming previously; in. deed, if more are now pat in, it may cause a better nucceation of ripe frait.
cucumbers - Plants that were recently plantad out to produce a winter supply mast be kept grow. ing freely, stopping the shoots at every other leat, $\mathrm{n}^{n}$ as to have the base of the trellis evenly corered mith healthy ahoota, at the same time remoring all the friit and male blooms as soon as seen, by which ment strong plants will be prodaced before the antumin Additional rich porona soil should be given at intervala of a week in mall quantitien, adding with it charcoal, lime rubble, or burnt-earth to keep the whole from becoming sour. The plantin should be ayringed regularly with tepid ritr water, and plenty of water used about the floors, \&ec, so as to ensure a growing atmosphere. Ventilution carefally daring bright days, and avoid an inrubt ouk cold air, or a sudden change of temperature. Weat stimulants may be afforded, but in the caee of planta
that have to atand the winter, it is not deirsble to that have to atand the winter, it is not denirsie s
promote a very grose growth at this season. Keep promote a very gross growth at this season. Kepp night temperatare of from $70^{\circ}$ to $75^{\circ}$; and darivg the day of from $8^{\circ}$ to $10^{\circ}$ higher; and if that as perature of the house is dependent ast mitren
possible apon nolar heat, so much the better.
soila.-Now is a good time to get under covers good supply of the different kinds of noils for will be ane, and a grod heap of compost, which will required next month for different kinds of fruit-read in pots, and for the renewal of Vine or fored borde

THE KITCEEN GARDEN By Joan Lambert, Gardener, Powis Casth, Weinimit QLOBE ARTICHOKE8. - Plantations consisithig old the oldest atools may now be cleared of decsivith fruiting stems, carefully detaching all leaves at the ame time. A'terwarda give an made dreasing of rotten manure. Young plantation provide in the apring as advised, thould now provide thel of heads of a deep green colour. Almays Heada mys be before the colour loses its fredhnesf. Hexare, if the kept fresh and fit for ure for neveral dyy.
atems are planged in damp moss or water, in a cool, moiat room. For late autuma catting, the plants should receive occasional moakings of manare-water, and be syringed after hot days with tepid sootwater.
cabbage and cauliflower.-Make another sowing of each of thes for standing through the winter; those of the first sowing will now be ready for pricking out, and this should be attended to at once. A planting of Coleworts may atill be made, if necessary.
endive and lettuce.-Make frequent plantings of each of these, and be prepared to protect the former if a severe winter ensue. Frtquent plantings of Lattuce should be made for winter ane, and a border facing west, sheltered by a hedge or wall, is one of the beat sites for thene plants. Good batches of strong plants should also be put out weekly on a piece of good land, well exposed to sun and air, for catting from until Christmas. Some of the plants should also be pat into framen.

MUSHROOM BED8.-In order to have a winter supply of Muahrooms, materials for making the beds mast now be gathered without delay. After trying varions ingredients for mixing with the manare in order to make it go further, such an tan, leaves, loam, \&cc., I find the latter to be the best; bat if plenty of good droppings can be procared for the troable of collecting them, these are all that is required. Leave in all the short litter to mix with the droppings, and let them be spread out in a dry, open shed. tarning them every third day or so. In about ten day they may be thrown together in a heap, and tnrned every third day, so that they may gradually become sweetened. The materials may theu be placed in the Mushroom-house, well treading them down, and making them very firm when of the required thickness, which should not be less than 1 foot. When the heat declinesj to $80^{\circ}$, it may be affely spawned. The brick of apawn may be laid on the beds to soften one day before it is used, and great care should be taken in spawning the bed to be sure that the piecer inserted do not lie hollow. The covering of the bed should consist of good loam, of about $1_{\frac{1}{2}}$ inch in thickness, and if this is from a meadow known to prodnce good Mushrooms, so mach the better; it ahould be beaten tolerably firm, and in winter the loam should be warmed before it is ased.

THY ORCHID HOUSEB.
By W. H. White, Orchid Grower, Burford, Dorking.
DENDROBIUMB.-By this time a few plants of the evergreen eection of Dendrobium, including D suavissimam, D. chrysotoxam, D. Farmerii, D thyrailloram, D. denaiflorum, \&c., will be finishing their growths; but as thene apecies continue to root for tome time after this, do not allow a lower tempersture than that of the Cattleya-houne. To plants that have completed their growth, the sapply of water at the root muat be gradaally lensened, so that the buibs may become hardened, bat they should not be kept too dry whilut the roote are active, or they will probably start a second growth, which generally is weak, and the new growth made in the spring will also be weak and poor. The hot summer has benefited such Dendrobiums as D. Phalænopois, D. superbiens, D. Goldieana, D. bigibbum, D. Bennorise, D. tarinum, D. undulatum, D. secundum, \&c. These plant should now be in the hotteat house, and if grown as they should be in amall pota, and these have become filled with roots, they will take almont anlimited supplies of water. In cases where the plants can be allowed a corner of the house to themselves, they ahould be allowed all the light and sunheat ponaible. If it be possible to ufford the plants fall anasine, let them have a liberal supply of fresh air during the middie hours of the day, and about 2 p.m. close the honse and ayringe the plante well amongst the leavea, which will cause the growths to come on freely and make mirong vigoroas balba. Some plante of D. Pha'æaopnis have already completed their growthr, and are sending out bloom spiker. When the flowers are fally open, arrange the plants in that part of the house where the ventilators are more or less alway open, or if convenient in the Cattleya-house, the drier atmouphere of which would suit them better.

BARKERIAB.-The species of Barkeria, as B. Lindleyana, B. elegana, B. Skinneri, and B. cycloclle are worthy of attention, their pretty and large Gower-spikes in proportion to the size of the plant, presenting a gay appearance during the dull season.

They acceed well ander treatment similar to that given to Dendrobiam Phalænopsis.

CALANTHE8. -In order to obtain atrong flowerapikes, and to secure clear and bright flowers, we fill up the room on the south aide of the East Indiunhoase, recently occapied by the deciduoar Dendrobinme, with the most formard plants of the deciduous Calanthes. The plants should be elevated well up to the roof-glasp, and so arranged that each obtain itn share of aunlight. Daring the middle hours of the day when the sun is bright, only a very thin shading is needed, but if exposed to the san in the early morning, and again in the afternoon, the balbs will finish ap atrongly. In the extra light the plants will dry quicker, and will require plenty of water at the roota, and an alternate waterings with liquid manurewater will be beneficial. The Regnierii section of Calanthen are only aboat half-way through their frowing season, and should therefore be treated the same as the others were when in full growth.

## THE FLOWER GARDEN.

By Buscer Wadds, Gardener, Birdsall Gardens, York. ROses.-Attention shonld be given to the ligatares of badded stocka, loosening these if they are causing any ribbing of the rind. Buda may still be inserted in stocks that were not in a fit atate for budding at an earlier date. The recent raina will have rendered the bark easy to raise The present is a good time to thin ont the blind, weak, and flowerlems wood of such varieies as give late bloom; and those growing atrongly and making a good deal of wood will also be benefited, an it will enable the strong shoots to become well ripened. Some of the best of the thoots that are removed will make cuttinge, and auch should, whenever posibible, be taken off with, heel; and they should be straight, and from 7 to 9 inches long. Insert them in well-drained, sandy loam, in rows at 12 inches apart, and 6 inches between the cuttings. making them firm in the ground, which should be dug over as the cattinga are pat in. If there are many cattings it is an expeditious method to dig a space, trample it firmly, then cat down a trench with a perpendicalar face, and lay the cattinga against it with their topa about three buds above the groundlevel, and proceed as before, and so on till all of the cattinge are put out. $\mathbf{A}$ border facing went is a saitable one for a cutting bed. hould be placed in pite or frames there they can be protected from frost. Where framen and a mild bottom-heat can be commanded, the propagation of Roses is rendered more certain. The cattings for this method of propagation may be 4 or 5 inches long, and they may be dibbled into 6 or 8 . inch pots filled with sandy loam. These potfals of cuttings uhould be placed in a cool, shaded house for a time, that is, till the wounded ends are calloused, and then plunged in gentle bottom-heat. When rooted, pot them off in small pot, and keep under glass till the apring. If a new ronery or new rose-bed have to be made, the work of getting the ground in readiness for them should be soon taken in hand. The best kind of soil in a strongiah loam, and if the staple is not of this nature, some heavy loam should be mixed with it. A rose-bed should have a depth of at least 18 inches, be well drained into a dry well, if the land is not naturally or artificially drained. If the absoil be clayey, it may be barned, or wheeled away; stabledang, crushed bones, and light loam should be added to loams that are very tenacious, and strong loam and cow-dang to that which is aandy and light. Hybrid perpetaal Roses should be planted early in the autumn, not waiting till every leaf has fallen, iff the shoots are well matured. When the planting is finished, mulch the plante with half-rotten stable manure. Notes may now be taken of alterations to be made in the rowe beds. Old rose-beds ahould be replanted during the antumn, the ground having been heavily manured and deeply trenched. If any freah plants are introduced, they ahould be lept by themeives. Make necure any long trailing shoot of ronea before the unal antumn galea come; and apply sulphur or other mildew antidotes if mildew be present on any of the rones.

## THE HARDY IRUIT GARDEN.

ze W. Pops, Gardener. Aighclers Cartle, Newbury.
gathering and btoring of fruit.-Fruitatoring will soon become general all over the couthern parts of the country. The fruit-rooms should be thoroughly cleaned and aweetened in
advance, the tables and ahelves thoroughly wahed with hot soapauds, and the walle lime-wanhed, uning frenhly-olaked lime, to which a handful of Howers-of-aulphur is added, and it ia beat applied whilat in a hot atate. This lime-wan will effect apeedy clearance of insect and their eage, and free the rooms of fungu-germs. Before the fruit is taken into the room, the latter abould be choroughly dry. Every deacription of fruit should be handled with care, for however hard an Apple or Pear, for instance, may be, they are raadily bruised, and braisee alwaya tend to early ieosy. A little woft hay bhould be put into the bottom of the gathering-baket. A mistake often made is to gather fraits when they are supposed to be large enough, without taking fitnens into account. As a guide, fruit may be cut in half-if the pipa are brown, the crop may asfely be gathered ; or thone which on being raised. part readily from the apur, may be taken first, ohere being left for future gatbering, it being seldom that all the fruit are ripe at one and the same time. Early varieties of Pears should be placed on different aspects, and some of them on pyramide or ntandard in parts of the country where these succeed, so an to lengthen the seanon as wach as ponible. Gathering a crop from a tree at various timen, an advised, hat also the ame effect.

PEAChes and nectarines.-The Peach and Nectarine tree should be examined daily, and all fraits gathered which part eanily from the thoots, laying them on clean woft paper or cotton-wool in a cool room till required for the dessert. Continue to expone all fraits to full sualight by tying back or taking away overshadowing leaves. As soon at a tree is bare of frait, ufford it a washing with the garden-tngine, so al to clear off red-spidor and other inuects, and at the same time remove copings of glass where thene are employed. Choice varietiet of deasert Plams may be gathered and placed in a dry airy room till wanted, an the fruits will keep in good condition for meme days, and they improve in lavour by being kept a day or two after being gathered. Bees, waspn, and fliez are very partial to ripe Plame, and atoring them in a room, the window: of which are covered with fine netting, is a better way of preserving the fruit than leaving it on the trees till required for tae. Of course the trees can be covered with netting, but everyone does not ponsens this rather expenaive atuff.

## PLANTS UNDER GLAEB.

By W. H. Smrrin, Gardener, Weat Deas Park, Chichester.
stove.-Planta of Pancratiam fragrans that need freah soil may be potted on, or divided as soon as they have finished flowering. Use a compost of turfy-loam, leaf-zoil, cow-manare, and sand and include a good quantity of charcoal, which will help to kesp the soil sweet under the abundance of water the plants require during their growing seamon. Plants which do not require re-potting thould receive frequent dressings with some well-tried fertiliner or farmyard manure-water while making their growth. Ipoccoas should now be placed in their floweringpots, and they are very bright and pretty-looking during the late autamn if trained on wire where they will obtain plenty of light. Pat in a batch of Tradencantia cutting for furnishing purposes during winter, and at they root very freely the old atock may be thrown away. Pot on young plants of Dracænas, Palm:, Codixam:, Pandanas, \&c. that are pot-bound. Take cutting of Strobilanthes Dyerianas frequently, at this plant has far better colour in a young state. WinterGowering Gennera should be afforded a small quantity of weak manure-water if the potn are filled with roota, and they should be placed in a rather dry position near the glase where the syringe is not likely to reach them, for mould the leaves get damped, diafigurement will zoon follow. Achimenew which have gone out of flower shonld be allowed to become a little drier at the roote, and whes the growth hat died down, placed anderneath a green house atage or in the potting-whed, where front ean be excluded.
plants in frames.-Continue to repot Chinese Primulas, Cinerarias, and herbaceous Calceolarias as they become ready, and if infested with fly, they should be taken into the greenhouse, and there fumigated. It is a dangerous practice to fumigate any tender plants standing in low framer, the leavee being very liable to get scorched or otherwiae injured. If the weather should become cool or the air very moist, mild warmth should be afforded auch plant sa the donble-flowered Primulas, Poinsettie palcherrima, Liboniat, Epiphyllame, Scutellariat, \&c.

## EDITORIAL NOTICES.

Advertisementa should be sent to tho PUBLISERR.
Newspapers,-Corresponients sending newspapers should be careful to mark the paragraphs they wish the Editor to see.
Lotters for Publication. - 40 communications intended for publicatiom, as well as specimens and plants for naming, should be addressed to the Editor, 11, Wellington Street, Covent Gardon, London Communioutions Street, Covent Gardon, LONdOH COMmumioutions
should be WRITEE ONE sent as early in the week as possible, and duly signed by the woriter. If desired, the sipnature will not be printed, but loeph as a guarantee of good faith. The Editor does not undercake to pay for any contributions, or to return unused commuthications or illustrations, unless by special arrangement.

COMREGTED A VERAGE TEMPERATURE FOR THE ENSU-
DNG WEEK, DRDUCED FROM TEE OBSERVATIONS ING WKRK, DRDUOED FROM THE OBSERVATIONS OF FORTY-THRER YEARS, AT CHLSWICK.-69'.

The National THE eighth National Co-operative
Co-operative Festival took place at the Crystal Festival. Palace on Friday and Saturday last, the preliminary meetings dealing with the economic and international aspects of the subject having been held in London on the preceding days. One of the chief of many characteristic features of the annual gathering at the Crystal Palace is a gigantic flower show, held under the anspices of the Agricultural and Horticultural Association-a large trading conoern conducted upon co-operative prinoiples. That the subject of co-operation is a powerfully attractive force is seen from the fact that some 70,000 persons visited the Crystal Palaoe on Saturday last.

From a horticultural point of view, the flower show must be considered to have been a distinot nucoess. The time has well nigh passed for contrasting the enormous extent of the display of last week with the two early exhibitions held in the conservatory of the Royal Horticultural Society's gardens at South Kensington; but the growth in a few years has been surprisingly great. The display on this occasion had to be confined to the eastern portion of the nave of the building owing to the other half being ocoupied, but it overflowed into the aisles and courts on either side. Owing to the rentricted spaoe the exhibition appeared amaller than in previous yearg, but the tables were most inconveniently crowded, clames ansvoidably overlapping each other, and oreating some confusion. There wan a marked increase of entriea in all the leading classen, and some iden of the enormons amount of detail connected with meh an exhitition is shown by the fact that there were 1823 entrien of vegetables; 1209 of out flowers; upwards of 500 of planta in pots; a con-
siderable number of fruit; in adidition to those of table decorations, ladies' and childrens' exhibits, farm-produce-for there are farms conduoted upon co-operative prinoiples, \&c. What all this means in the way of clerical work and close attention to details, can be grasped only by those who undertake such work, and can thus know something of the burden of labour imposed apon Mr. Gkorgr WAUGH, the Direotor of the Flower-show, and his staff of assistants.

Looking along the tables, here and thore could be noticed an apparent diminution in the numbers of exhibits, but these related to subjects influenced more particularly by the long period of drought so generally felt, and which preceded the grateful July rains. In other classes there were marked additions; and let it be recorded, the average quality was decidedly high. If any exhibits fell below it, it may be safely assumed that they were the produotions of new exhibitors who had not mastered the knowledge of the qualities in vegetables which gain prizes, or who were led to think that mere bulk without corresponding symmetry would find reoognition by the judges.

Plants showed a noticeable advance in size and finish, the largest of course coming from places within a reasonable distance from the Palace. Many of the specimens are becoming too large to be placed upon tables where they are above the line of sight, and should hereafter find places on the ground floor, so as to be seen to advantage. Fuchsias, zonal Pelargoniums, Begonias (flowering), Petunias, Musk, Lilies, Coleus, Ferns, and others, were in many oases satisfactory examples of oultural skill, and annuals in pots were specially attractive, though there appeared a doubt whether some Stooks, and Asters especially, had not been grown in pots and lifted from the open groand for the oocasion. There were fine examples of Mignonette, Coreopsis, Godetia, Shirley Poppies, Canarybird-plant, Convolvulus minor, Phlox Drammondi, \&c., well-proportioned, and well-bloomed. Bunches of flowers, and especially of annuals, were pleasing festures, and it was seen that the small posies of a few years since had given place to bouquets of finely-grown and tastefully-arranged blooms. Sweet Pens were much in evidence, the beautiful new varieties of Eckford's raising eapecially; Afrioan and French Marigolds, the varieties of Malope grandiflora, Linum grandiflorum rubrum, Zinnias, annual Chrysanthemums, blue and yellow Cornflowers, were all most attraotive. Some features introduoed to the sohedale this year for the first time, in the form of bunches of blue, crimson, and yellow annuals, were deoidedly instructive, having a oertain educational value, as only one variety of flower could be placed in a bunoh. Some exhibitors place several varieties of one speoies in a bunch, imparting to it a confused appearance; whereas, where only one variety is used, as wal obwerved in the case of the Sweet Peas, their attractiveness is enhanced.

Fruit, largely exhibited by the gardeners of members of the Association, was in many cases of excellent quality; Grapes, Melons, Peaohes, Nectarines, and Figs-worthy of any exhibition. Culinary Apples were very fine; the dessert varieties in not a few instances brilliantly coloured; Plums in many sorts, and bush fruits were well reprenented. Object-lessons in staging are always instructive at an exhibition of this kind, and it is creditable to the exhibitors of fruit that they were plentifully supplied, and instruction drawn from them.

Of Vegretablea there was no lack, as the number of entries showed. Potatos showed in
some instances the usual finish seen at a 00-0perntive exhibition; but Beet was here and there coarse. Of other leading vegetables there were excellent illustrations; Raroner Beans were very good, and Peas in good oharacter. It is matter for regret that district oollectionsNorth, North-western, Midland, \&c.-Were absent almost entirely, except in the metropolitan dis. triot, and thas prevented the institation of comparisons. Some of the exhibitors on Saturday are leading growers of vegetables for show and so high quality was represented; while the staging of the exhibits was perfect. Herbs wero largely shown, and formed an instructive feature, though they were much crowded.

So large has the show become, and so keen the competition, that it is now found necessary that the judging of the exhibits be extended over two days, and so the competitive contributions in certain sections are staged on the first day, and the remainder on the second. This is advantageous in many ways, and particularly so in this-that something fresh and bright is secured to gladden the eyes of the concourse of people who attend on the second day; while it materially relieves the pressure associated with a one-day show. Let it be recorded, to the credit of the oo-operators, that, despite the enormous throng, there was an entire absenco of confusion, or of anything approsohing disorder. Great credit is due to Mr. Edwabd Owen Greening, the chairman of the Festival, for the smoothness and regularity observed in every department. An important leader in the co-operative movement, a man of business resource and prinoiple-he has led on this greast annual gathering from small to hage proportions; seeing in it a force making for the public weal, and the bettering of the condition of masses of people.

The Rxhibition at Shrewsbury.

Greater success even than for merly attended the exhibition of the Shropshire Horticaltural Society on the 21st and 22nd inst. at Shrewsbury. For many years past this large gathering has been reoognised as one of the most imposing displays of the year, and its capacity for growth and extension has been apparent from season to season. Whilst many hortioultural societies have been sabject to temporary, and, in $\operatorname{some}$ instances, perpetual financial embarrassment, the one in question has not only been free from such experienoe, but, on the other hand, it has, after duly disoharging its own liabilities, able to benefit various institutions in the town to the extent of many thousands of pounds.

There can be little doubt but that mach of the Sooiety's financial success has resulted from the inolusion by the committee of various attractions in connection with this floral fête, which have nothing whatever to do with hortioulture, but whioh, by appealing to a very different seotion of the community have increased the attendance and therefore the reoeipts to a very importand extent. But apart from the help that ha beot gained from variety entertainments (whioh $\begin{aligned} \\ \text { gh }\end{aligned}$ as hortioulturists, would be pleased to see the Society strong enough to abandon), there he been no limit to the interest and help extendea to the Society by the whole community in whate midst the exhibition is held. The worl tmo the committee also, with the help of and indefatigable necretaries, Messrs. Ansili frio NaUnton, has been conducted withou The tion, and on excellent basiness principlea facts help to explain the sucoesg of the tho w first exhibition, when a sum of about wore mold offered for competition, and there were as mild
as 2800 entries, being, it is said, 400 more than on previous occasions.
If we compare the exhibition for a moment with the important one annually held ty the Royal Horticultaral Sooiety in the Temple Gardens, there are features in either case that
sented there, and therefore the two exhibitions have little in oommon with each other.

One of the most prominent and at the same time one of the most pleasing features at Shrewsbury, is the colleotion of groups of miscellaneous plants arranged for effect. Indeed,
around the foot, grasses and Ferns and flowering plants were intermingled in a charming manner. The cones towards the front of the group, like small mounds, each farnished in the best possible taste, and other features of the arrangement that we cannot now notioe, were beyond

Fia. 48.-cthozocodon wititi. (anh P. 234.)
A, Calyx; B, base of flower; C, flower bud:

F, Lobe of corona, 2 central, 1 and 3 lataral :
G. Stamen inflexed, one refiexed to ahow the pallen maes:
are wanting in the other. In extent, we think the display at Shrewsbary is larger; the tents are enormous, and they are filled. It would be impossible daring August to obtain such an exhibition of Orchids as is seen each season at the Temple, even if Shrewsbury was a oonvenient place to send them to, which it is not. As a matter of fact, Orchids are barely repro-
we have never seen a more tastefully-arranged and attractive display of this kind than that for which the first prize of $£ 20$ was awarded to Mr. J. Cypher, of Cheltenham. In the place of a central cone, such as appeared in all the other exhibits in this class, Mr. Cypher had placed a rustic arch, from the top of which sprang a gracefal Palm, whilst in saitable pookets and
criticism, and if the back of the group had been more bold, the whole would have been perfect. Mr. Edmonde, the gardener to the Duke of Sx. Albans, Bestwood, Nottingham, and other exhibitors in this class, were well worthy of praise also.

The collection of twenty stove and greenhoase plants from Mr. Cypker represented in
almost every instance the highest caltivation possible, and could hardly be over-praised; and other classes for specimen plants were equally well filled. Colens in the form of pyramids were very good, and Dracænas, Caladiums, Fuchsias, Begonias, and Pelargoniums were all exhibited satisfactorily.

Fruit is usually shown well at Shrewsbury, and it was good on this occasion, but we are likely to see fruit of equal or superior quality at the Royal Horticultaral Society's exhibition at the Crystal Palace in September. It may be aseful, however, to draw attention to the important class in which prizes amounting to $5: 50$ were offered for a collection of twenty kinds of fruit, arranged to produce the best effect, by the addition of Ferns and other plants of an ornamental character. Several of the exhibits, and especially that from the Earl of Harrington's garden, possesed very much more attraction to visitors than the collections would have done had they been staged in the usaal manner. Pine-apples were exhibited as growing, Melons were suspended on invisible supports, and intersperstd with trailing plants, whilst hard fruits were on moss, and the softer ones on suitable foliage-the whole forming a beantifal pioture. Night not this idea be adopted and extended in connection with the Crystal Palace exhibition on a future occasion? It may be objeoted that fruits so arranged are not so easily compared with other samples, and the judging is readered difficalt. But this obstacle will have to be overcome in the case of fraits and flowers alike if we are to make our exhibitions more attractive and less monotonous than they are. If hortioaltural shows are to become self-sapporting, and independent of extraneous enticement, which is very desirable, they mast be arranged so that they will appeal to the persons who enjoy striking effects as well as to specialists who stady the exhibits in detail.
Cat flowers, artistic floral arrangements, exhibits from prominent members of the horticultural trade in the North and in the South, and regetables also, farnished ample occasion for remark; but in regard to these, we must refer our readers to the hastily-prepared report pablished in our last issae.

Mr. Barron's
The retirement of Mr. Barfon Retirement. from the direction of the gardens at Chiswick oontinues to excite keen interest. The more that is known of the circumstances, the stronger becomes the feeling that the Council has, we doubt not, quite unwittingly, and without the least desire to act otherwise than considerately and honoarably, committed very serions error in judgment, in the way in which it his carried out what it deemed to be expedient. It is felt that an outside irresponsible committee, appointed by the Council, should never have consented to act as it did, and probably the mombers would not have done so had they been in the least aware of the consequences of their action.
Granted that Chiswick does not fulfil all the duties of a modern experimental garden suoh as the requirements of the times demand, and admitting that much that is done there is inconsoment with the more legitimate objects of the Society, the fault surely lies with the Counoil, and not with their executive oflicer.
The letters that we have received bear emphatic tentimony to the intensity of the feeling aroused, Council is an absolute necessity the part of the explanation is forthcoming, sad till the names of
the committee and the details of their report are made known, we are naturally loath to "apply the toroh to the heather," as one of our correspondents puts it. He, like some others, urges that there should be no delay in doing this, and that he is ready to do it! Such a step, however, would be manifestly anjust to the Council, whose explanation is not before us; and injarious to the Society, on which accoun we would counsel a more pradent course. We believe that a Council meeting is called for Monday next, for the parpose of considering the question, and till then it is well to reserve further expression of opinion.

In the meantime, we may add that a protest has been entered by the Chiswick Board, and that a preliminary meeting of horticalturists, presided over by Dr. Masters, has been held for the purpose of devising the most appropriate means of expressing sympathy with Mr. Barbon, and of testifying the admiration felt for his loyalty and faithfulness in the discharge of his duties, respect for his abilities as a horticulturist, and esteem for his qualities as a man. The circamstances attendant upon Mr . Barbon's retirement were designedly not discussed on this occasion, the business of the meeting being confined to the objects above-mentioned. At this preliminary meeting a Committee was formed, "with power to add," and a further meeting was convened for ${ }^{5}$ eptember 10. Among those present on this occasion were-Messrs. Baker, Barr, Camming, Gilbert Beale (Carter \& Co.), Gordon, Herbst, Laing, May, Miles, Masters, Marshall, Pollett, Smee, Spiver, Tarner, Weeks, Wynne. Messrs. Sutton \& Co., Messrs. James Veitoh \& Sons, Mr. Burbidge, Mr. Malcolm Dann, Mr. D. T. Fish, Mr. W. Robinson, and others wrote expressing their sympathy with the objects of the meeting. Mr. Marshall and Mr. B. Wynne consented to act as secretaries, and a sum of about $£ 100$ Was at once promised by those present, it being ulderstood that the amounts subsoribed should not be made pablic, bat only the names of the donors. When the permanent committee is fully formed we shall revert to the subject.
"Les Plantes Alpines et des Rocailles" (Alpine Plante), par M.H. Corervon, Directear du Jardin Alpin de Geaève. (Paris: Octave Don, 8, Place de l'OJéon.) This in a mall book, the purport of which is threefold, vize, to aupply deacriptions, cultural directions, and hints on the acclimastisation of alpine plants. It is but natural that the cultivation of alpines in any one sitastion muty if it is to be acceanfal, be gaided by knowledge of the varying localities and circumatance under which the planta grow natarally. By studying the altitade, oil, aspect, and climatic condition of their original habitate, nome alpine plante can be acclimatised, but in no other way. M. Corravon appends to him book a liat of the mont important alpine plants which aucceed ander caltivation, giving also brief deacriptions of each, and hints for caltivating in accordance with the rule above-mentioned, and with his own experience in acclimatining. Various illuwtration supplement the cultural directiona.

Shortia School.-Some of our readery will remember the history of the Shortia, how it was discovered by Michaces, and not found again till within the lant few years, how by come the plant was looked on as mythical, how it furnished one of many proofe of Asa Grav's agacity. All thil is told in the Chronicle. And now we find from Meehans' Mowthly that a achool called the Shortia School has been establimed in North Carolina out of the proceede of salen of the plant. Very well-bat let the acholara be taught not to exterminate the plant,
but rather how to cultivate it.

ThE "Tropical AqRiculturist." - The fourteenth volume of this periodical (pabliabed a Colombo, Ceylon, by Messrs. A. M. \& J. Fbeacsoy) is now completed. The periodical furnisher monthy a valuable summary of information ensential planters in all tropical countries. Accaracy an atraightforwardness are conspicuou featuren in in management, $n o$ that the fourteen volumes conatity a veritable encyclopædia on the abjects of tropical
agriculture.

Cheshunt, Warmley, and District hoai Cultural Mutual Improvement SocietyThe fortnightly meeting of this flourishing noeieg was held on Tharsday last. Mr, Wm, Harang presided, and there was a good attendance of members. After the minutes had been read, $M_{p}$. W. L. Yates delivered a lecture on the caltimaion of the Peach and Nectarine. At the clone, an interesting discassion ensued, relating to dineaed brancher cansed by gamming; on manaring and on bliatered foliage. Mr. H. Rasmussen gave details of the calture of Peaches in France, together mith the names of varieties. A hearty vote of thaiku was accorded Mr. W. L. Yates for his lecture, The next meeting will be held in St. Mary'B Halh Cheshant, on September 5, when Mr. James Doogus, F.R.G.S., will read a paper on the Carnation. Mr, George Paul will preside, and will be aupportod bo the leading gardenors of the district.

Dahlia Show at the Royal aquariumThe Annual Dehlia Show is to be opened on Tandy next, and continaed on Wednesday and Tharday, at the Royal Aquarium, Westminter. The entrienaro very promising, and the show will include Gladiolu and early-flowering varieties of the Chryanthemum All typen of the Dahlia will be on view, bat apecild interent is attached to the "Cactus" varietian, of which there will be a apecial exhibit. The Gladiolu will be more than equal to last year'n diaplay, and the National Chryanthemam Society have arrauged for an extenaive exhibition of the early varietien.

Hallstorm at Harpenden.-A terrific hail storm occurred at Harpenden, Herts, about 4 o'cloos on Tharaday morning, August 22, doing an immenwe amount of damage to property; some of the hailo atones being 2 inches across. Mr. Phillips, onna of a number of glashouses, had one side of alld them completely riddled, hardly a mound pare of glass remaining; while Mr. Purrotr, who ons about $104,562 \mathrm{sq}$. feet of glans, had also a greet amount of it broken, and mach damage done to Graper, Cucumbers, and other atock. All the gess broken was 21 cz . Buth narserymen had minely insared in the Nurnery men's Hailstorm Insurance Ofo $^{\circ}$ poration, 1 \& 2, King Street, Covent Gardea, W.C.

The Royal Parks at Stockholm.-y Milner is entruated by H.M. the Kive or Swain with the laying oat of a park of 1100 acres. Tha plan: have been approved, and work has been colvo meaced, with an English foreman to auperinted the workmen.

Aaave a ericana.-Mr. Ushre, of Wooditods House, Golder's Green, Hendon, obligingly end wh a photograph of a fine Agave, 25 feet high, noll coming into full bloom, and, placed againt a bacto groand of trees, is aingularly effective.
"THE LADIEG' GA ETTE."-This little paper in se it name aggesta, chiefly devoted to topics irs and ing to ladies. Gardening note are parymplit apon bulbs for winter flowering, and apon decont house-fronts. The price of the journal is now to bo a penny weokly, and Memars. Coucnagriden ate th il congratulated upon the general sppearance of min this amaller aize, and upon it anccess among competitors.
 bedded-out plante at Manchester Roya is now brilliant in the extreme. The few days have fored the extreme. into a mas of for
beanty. One is pleased to see that the powerfal contrating or, we ought to asy, killing colours of yellow and acarlet, yellow particularly, is toned down. Most of the arrangement we came acrons, and the yellow overpowerall other combinations. Huw pleat ing it in to see here the old woft lemon-coloured Calceolaris asplexicarlis in some of the groupa ! indeed, we have not one among the noveltie to compare with it. It is a bit rambling in growth, certainly; bot resting in Centaurea ragaina, or some other proper thing to act as a frill, it is more than capti-vating-only we mast not have too mach of it. The Antirrhinam: here, too, are most atriking, a they are floriferons, and how easy to get! a hilling
ander the presidency of Mr. B. Ladiams, F.R.H.S., the lectarer on this occasion being Mr. J. Miles, gardener to Mr. W. Pregin, J.P., Portemood House. Practical bints were given by Mr. Miles on the time to gather fruits, and the mont convenient method of doing so. He gave a description of his enpeciallybuilt frait-room, in size 40 by 12 feet; and drew attention to the necessity of good ventilation and the maintenance of a tempersture of about $40^{\circ}$. He touched lightly on the colouring of Apples. A lively discasion on packing fruit for transit followed the leciure; and at the close a hearty vote of thanka was accorded the lecturer. A good display of fruit and duwers was made by the member.

Fia. 49.-polycychis lehmannt.
(From a photograph by Mr. Lawrence. For description, see p. 192; general colour yellowish-whito: spotted purple: lip, white fringed.)
packet of aeed will farnish a good bed; and now that We have such an is meen here, a dwariness obtained from proper selection, the colours are quite like the rainbow, and although there is a little formality, it is not nearly so pronounced as in any of the Pelargonium, Calceolaria, or Lobelia groups. There is an easinese of contour that pleases the practised eye. The Pentatemons, too, are in evidence here, and what a glorious diaplay they make! True, Mr. Findlar doer not introduce these into his formal bedding groups ; be has them in detached beds in the grase, but acting as foils to the formality of these erpentine desigas, which thow off to advantage the low-growing hero of beddern. Thene old-fanhioned flowern catch the eye, and even are useful because they can be knifed away for bouquet work without affecting congruity.

Shirley and Surrounding Districts Gardeners' and Amateurs' Mutual ImproveMENT A88OCIATION -The monthly meeting was held at the Parith Room, Shirley, Sonthampton,

## Home Correspondenoe.

sLuGB descending by a line of 8lime. It is now some fifteen years since Mr. Warner called attention in the Gardeners' Chronicle to the fact that slugs have the power of letting themselves down from a plant or rafter by means of a glatinout matter which they exude from their tails. I remember at the time some were inclined to smile at this assertion. I had seen the mame kind of thing myself, and I well remember calling my employer's attention to the fact when at $D$ ownoide, as a slag wat dencending over a Madevallia; and it it quite clear, in my mind, that while at Highbary, Birminghaw, I saw a slug on the flower-apike of an Odontoglownm, and in order to prove if tobacco would prevent them cramling up the apiken, I placed a piece of "ahag" tobacco on each wide of the alag, and stter going to and fro a few times, it let itself off very ulowly by the slime from its tail. Your correspondent mentions that no one rasde any remark upon this question when first it was mentioned; my excuse is, that I accepted it as a well-known fact, and believe that alag (nome kinds, at leant) have the power and
intinct to make ate of the alime from their body either as means of encape or for the parpose of obtaining food. C. Woolford, The Priory, I. W.

DORYPHORA 8A88AFRA8.-The interenting note on the above ovar the eignatare "M. T. M." in your iseae of Jaly 13 invites an additional word or two. The plant will be found in Meara. Jab. Veitch \& Son'r Caiaiogue of Greenhuse Plants, indicated at having ornamental foliage. I procured a plant from that source three gears since, and from its not being liased in the stove section, placed it in a conmervatory. It has made but little growth, and is found to need repotting. I am glad to adopt "M T. M's" advice, ard heve removed it to the intermediatehouse. Dorvphora eansafrac in mentioned in Lindley'a Tregetabie Kingderis (1847) follow: "Tre wood of D. saseafras, celled Susemfrae in New Hulland, is anid to scoell like $F$-anel." I muat point ont an error into which Mearn. Voitch have falien in giving
 Tae S cuafres wood of madicina is derived from Sustairas Cffisinaly, Nees (Laurus Stenafram, Lino.). wrowing over extenaive diatrich of the C uited Scates. Baltimore if the cbjef mart for ita diatribution. R. Reynolds, Leeds.

KNIPHOFIAB.--I have now some mont dintinct and b-astiful bybrid Kuiphofio in good bloom. Lechenis, clear apricot-yellow; Surias deep orange; Priniden: Cleveland, very fiae pikp, and a free blocmer; Acrantiaca, one of the largest head and freest bloomer of all my plante, producing nineteen heads this year. I hope also to bloom bhortly for the fint tinoe the Luichtinian hybrid Titumph, said to be the bandsomest of them all; and also the pretty little species N-lsoni, which bloomed with me lavt jear in the second year from seed. I have also poriced a caricue fixed difference in the order of opening of the diff-rent bybrid Kuiphofis; those in which the blood of $\bar{K}$. Aloides predominates, all commence to open at the bottom of the spike, and En on apwards. Those in which the blood of K Leichtani is atrongent reverse this order, and commence to oprn at the top of the sike as Leichtlini always duen, while the bybrid of $\mathbf{K}$ comosa commence to opan in the middle of the apike and go on up sud downwards. W.E. $G$, queenstown

GIANT LETTUCEB. - I naw recently nuch very fine Paris White Con Lettuces, of what is known as Milton' Superb White strain, growing in the gardens at Maiden E:legh, Reading, that I anked Mr. Tarton to weigh one. A good example was, therefore, twisted ont of the groand and pat on to scales, when it was found to be $4 \frac{3}{4} \mathrm{lb}$. in weight. The stock was very true and even throughoat, and premented unqueationably mome of the finent and most solid Luttaces I have aeen. The anme firm's Favourite Cabbage Lettuce alwo showed not merely remarkable siza, bat muprising solidity; the hearts were of the size, roundness, and almont hardness of a good Drambead Cabbage. Those who want balk in salading will find thee varieties to give them all they may dexire. A. D.

CYPRIPEDIUM $\times$ LORD DERBY.- Owigg to an error of mine, this plant was certificated (F.C.C.) on Augut 13, 1895, by the Royal Horticultaral Society' Orchid Committee an Cyp. $\times$ Mastaianam superbum. To-day (August 2i1) I was able to correct the error, and the plant wan named as above, the name given it by it owner, T. Statter, Eaq, being now restored to it. It came about in thisway. A cat apike of two grand blooms came before the committee, named "Cgp. $\times$ Lord Derby" $=$ E. Rothachildianam $\times \mathrm{C}$. auperbiens. I consalted my records, and saw the entry of this parentage, only reversed, against C. X Masaianum. I informed the committee, snd we then had a plant and a cut pike of C. $\times$ Mamasanum brought for comparion from group in the hall. Mr. Statter's hybrid was infinitely the finent, and "superbom" was added to its proper name (according to my entry) of Manainam. Some discusaion at to the parentage of Cyp. $\times$ Mananianum enaued, bat not eufficient to prove I had made an error. The plant was booked, On returning home, I conulted more records, and found the error. I had written "superbiens" instead of "superciliare." This materially altered the case; and now opened another complication. Crp. $\times$ W. R. Iae (A.M., Aquat 14, 1534). Wan the realt of Cyp. aperbiens $\times$ C. Elliottianum (which is synonymous with Rothachildianum). I at once wrote to Mr. Statter, explaining the case, and atating that now the name again must be altered, for reverse crosse were regarded the ame one as the other. Mr.

Statter's reply was good-natured in the utmost, he being very disappointed that his proffered compliment to Lord Derby had been upaet. We decided together to try and correct it at to-day's meeting, at which I explained the whole matter, and for compariten we had the apise of Lord Darby, and Mr. Macfarlane's admirably executed painting of it, and Cyp. $\times$ W. R. Lee. This latter plant Mr. Statter told ua was dead. Therefore there was not another plant of the same parentage that had bloomed which was alive. The committee appreciated this fact, and it was carried unanimously that "Cgp. $\times$ Lord Derby" be Mr. Statter's hybrid's name. This action of the committee enabled me to eacape from a position assumed by taking a false entry to be correct, when it was the reverue. (Moral. The whole of the members of the committee ought to keep records
and check one another. Perhapu way my readera, and check one another. Perhape ary my readera, tial thing they do not"-vide thin case in point.) De B. Crawshay, Roseficld, Sevenoaks, Kent, Aug. 27, 1895.

Chiswick.-May I sak if it is a fact, as atated by Mr. Peter Barr in a contemporary this week, that what he calln a "atarvation allowance" of f1624 15s. 1d. is the amount apent on Chiswick gardens (some 12 acres in extent) annually? I offer no comment on the disposal of this anm, bat would like to say that I have known, and know now, the annual expenditure of some of the beat kept and most expensive private gardens in the conntry, and the above figare is from two to three times more than what is uasilly allowed to pay all expenses, in proportion to extent; while most gardens at the present time cost probably mach less even than that, while mach is expected, considerable reductions made on auch redaced allowance by staff sold, and no "asaistant atadents" thrown in to help for which nothing is charged. Few of our big gardener's real friends would think of going into hyaterical lamentationa over a penaion of $£ 180$ a year ander thene circumatances. Head. [Oar correspondent is evidently not aware of the circumatances of the care, and in particular of the large amounte spent in repairs and renovations necensitated by previous neglect. Ed.]
Why araujia albens does not catch
The CODLIN moth.-la the number of the Gardeners' Chronicle for August 24 is an article on the moth catching habits of A. albens, which I presume is the same plant as Phyianthus albens, [ [es] often alluded to, and probably more tban once figured in these columns. The article concludes as follown:-"It is, however, a singular fect that, in New Zealand, where the plant has often been cultivated for the express purpose of destroying the detested codlin-moth (Carpocapas pomonella), that wily insect declines to enter the trap." The colonists seem to have argued somewhat in this fashion:-Here is a plant, the flowers of which catch motha by grasping them by the tip of the proboscis, and holding them till they die. C. pomonella is a moth; therefore, the flowers should catch it. It does not appear to have occurred to them that there are moths and moths. And if they had compared the mechanimm in the tube of the flower with the mouth-parts of the ineect, they would have seen at once how utterly impossible it is for the Aravjia to catch the carpocapas, inammuch as the latter has no proboncis capable of penetrating even the shortent diatances down the long tabe of the former. Ponibly, however, as the atorylin given ${ }_{\text {at }}^{\text {at }}$. Mcond-hand, it may be intended for a joke. R. McLachlan.

WHITE WAMRINGTON COOBEBERRY. - It may Interest Mr. Dow to know that his discovery of a white-fruited aport on the Red Warxington in not the firat that has been obwerved and perpetuated. In the horticultural department of the North British Agriculturist for $1850, \mathrm{p} .554$, is found a very interenting
article from the pen of the late Mr. William Gorrie article from the pen of the late Mr. William Gorrie, relating his discovery of a similar sport in a PerthMire garden, as also an editorial note from the late
Mr. Charle McIntosh, of Dalkeitb, detailing the excellent quality of the frait. I may aluo atate that ancellent quality of the frait. I may also atate that Measrs. Lawwon, Edinburgh, by Mr. Gurrie, and the writer being one who astinted in stocktaking for some years in the fruit department there, in 1856 wome bundred of fine saleable plants then exiated; on onquiry some yeara afterwarde, I accertained that the variety had degenerated in growth as to be I have not known of it being for nearly forty jears I have not known of it being either in commerce or mors permanent exitence. \&cotland, Eavt. have a

THE RECENT SHREWBBURY BHOW.-The committee which controls the fortunes of this really wonderful horticaltaral exhibition recently pablished a liat of all the numerous gifts they had locally made from their arplas funds, amoanting in value to several thousands of pounds. All honour to them. Bat looking over this list, I failed to notice any donation being made to either of the great Gardening Charitien. I trust there can be no harm in respectfully inviting attention to the needr of these charities, and to point out how valuable and helpfal they are to gardeners who so largely help to create those magnificent shows for which Shrewsbury is so famous. Possibly it is bat needfal to invite the committee's attention to the Gardeners' Benevolent and Girdeners' Orphsn Fands to secare as a memento of the brilliant success in every way
which attended their recent how, of handsome donations to each fund, and thus identify the Shrewabury mociety more clonely with horticulture. $D$.

POTATO dIGGING IN IRELAND.-Your artist correspondent on p. 133, of August 3, gives a very hopeleme looking aketch of poor Pat digging his Potatos. many places in the south of Ireland, and have come acrons a few such cases, but your reader must not be misled and think that all Potato patches or the people who till them are all alike. A friend of mine living near Tipperary, told me that the land in that county is some of the beat he has ever tilled and pastured in Ireland, and his crops and cattle thowed it. Potatos, as we know, are the chief food of the working classes in England, Scotland, and Ireland; every cottager and peasant who rents or owns some land, grows them. The varietie grown are Flounders and Champions, and no one can perauade them to grow any other varietie. The Potato disease is not known to them by any cientific name, and all they know is that the tubers are bad, and they never try a remedy againat the disease, although a few that I know have tried the eprayer, but they said that it broke down the top too much, and would not try it again. I have found in Ireland that the poorer the land the better the Potato crop. I have the finent crop this year I ever had, the land having bad no manure for three yearm, and I have seen no trace of disease up to the preaent date, but rotation in cropping hay, I think, a great deal to with this. $T . S$.

BUD. GROWTH.-On some of my Rhododendrons I notice that at the ends of the shoots both flowerbuds and leaf-buds have been formed during the summer, the flower-bud being terminal, the leaf-
buds lateral. Nothing ancommon in this, buds lateral. Nothing ancommon in this, one may asy; but what in interesting is, that the leaf-bude have lengthened into shoots, whilat the flower-buds remain buds. Why should growth go on in the one and be arrented in the other, the period of formation and the conditions being the mame in each case? $X$

The weather and fruit trees.-The past dry aummer and recent abandant rain have prodaced a curioun effect on an Apple bush (Stone's Pippin) growing in the orchard at this place. About one-half of the namber of branchen are loaded with fruit, and in consequence have made little growth, except extenaion. The branches carrying no fruit made hort growths, atadded with flower-bude, which matared during the dry weather. Since the raina came these have developed, and the tree now presents a picture of flora and pomona auch as I have never seen before, every branch baing either loaded with fruit, or wreathed with bloom and tender leavee, being in about equal proportion, the tree has a charming effect. The frait-buds on other trees in the wame orchard thow no sign of moving. M. Webster, Kelsey Park, Beckenham. [A similar condition of thinge is to be witnessed at the Royal Horticultural Societp's Gardens at Chiswick, where a quarter of Apple buahes, transplanted late in the epring. were, an a consequence, at a standstill during the warment part of the summer, and they are now fuil of blonom, and
making a little new foliage. ED.]

VEITCH'S CLIMBING FRENCH AND BUTTON'S TENDER-AND-TRUE BEANB.-In the report of the Fruit Committee meeting held at Chiawick on the 16th inst., it in atated in the second paragraph (p. 218), that the committee having seen the abovementioned "two Bean! growing here (Chiswick) together under precisely similar conditions, came to the important conclaion that they are absolutely identical, but that they all the same leave to others to determine under which of the above names the variety hall hencefurth be recognised." At the raiser of "Veitch"' Climbing French Bean," I nhould
like to mention that the decision of the Frait Committee (the correctnens of which I do not for moment question) raises a very delicate, bat all the of-shall I ay-serious questions, inasmuch as the Bean which the Fruit Committee decided on the 16 sh inst. to be identical with "Tender-and-True" was, as a matter of fact, sent to Chiswick for trial together with a full description of its habit, \&on April, 1885 (nix years before "Tonder-and-Trus" was anbmitted to the Rogal Horticultural Society for trial at Chiswick), and for which I received the official receipt, signed by the chairman, and dated, 1 believe, April 9, 1885 . And this being the of
commanication received by me from the Ropal Ho ticaltaral Society in reference to my then Climbing Canadian Wonder Baan (now Veitch's Climbing French Bean), and seeing that no mention was mado of it in the autumn mport of novelties tried at Chis wick in 1885, the question very naturally, and jutly, arise as to what became of the "Climbing Frasch Bean" sent to Chiswick for trial in April, 1835, and which, ton years later (1895) is pronounced by the Fruit Committee of the Royal Horticultural Society to be identical with one (Tender-and-True) to which that body had granted a Firat-Clas Certificate at Chiswick on Sept. 3, 1891? And now it seems that the name under which the variety is henceforth to be recognised is left to others than the Fruit Committe of the Royal Horticultural Society to determinethat is to asy, the question as to which name the commercial right of priority belonge has to be determined. The answer mat be obvious enough to all who take the trouble to read the above facta. A reference to the connterfoil of the Chiswick "Record" of seeds, \&c, received for trial in April, 188jे, mill conclusively settle the question of "commercial right of priority." As regintered in the book referred to will be found "Climbing Canadian Wonder Bean. Ten years have I kept the abova-mentioned fact from the horticultural prean, and had it not been for the turn which event have recently taken, probably I should never have referred to the matter in print H. W. Ward, Lonqford Castle, Salisbury.

Mr. barron's retirement.-H3d Mr. Barron' reaigaation been voluntary, the mere authoritative announcement that he had reaigned, and that hir servicen were to be rewarded by the Conncil with 8 liberal pension for life, might have fitly closed what to very many must have proved a painful incideat But if he has virtually been hanted out of the oficte he has for so long enriched, then the gardeners of the country are entitled to the fullent explanation from the Council. In your first notice (Auguet 3, p. 138), after referring to the innumerable dificultier and precariousness of Mr. Barron's ponition for may years, you state in true and forcible words, which al loyal horticulturinte will heartily endorte, thiswid has been put into good order, and horticulturith long to see it the exponent of progrenive horticalture, and the trial-ground for all that is promining and inatructive. They do not care to see it com-
peting with market growera in the sale of Graper, and they think that the services of the staff might be more profitably employed than in giving for distribution among the Fellows plants which are readity to be purchassd for a few peace at the nesrem florist's." Thene worde are true, and in them nome of us read a probable cue to the reaiguation of Mr. Barron. Bat a writer in the Garden diapela smen illusions, and makes matters no bad, that the com tinued ailence of the Council would prove a ariow blunder. It seems imposnible that such a mocioj should have acted in the manner here described, and should any sach report to obtained and signed havo reached the hand of the Council, one might haro expected that they, of all men, wonld have felt that the proper place for it was the fire. I fear the Fallom, and especially the fraternity of private gardeners, whed not now be asticfied until they know who appoint the this special commitsee of eapionage-and withoat mes knowledge of the Garden Committee, the privato and addresses of this private committee of privaso gardeners, and whether or not the Garden mittee of the Royal Horticultaral Society hat aloo retired in consequence of this indignity heaped apva
it? D. T. Fish, Auguat 19 .

The dimminal of Mr. Barron, forsooth! The gardeners of the country would an woon have expecter to have heard of the dimmisalal of the Council of the Society! I am always loth to condemn either of before I am fully informed of the whole dotam antl both sides, but the question has now anamed st
without the fullest diuclosare of the reasons for the procedurea taken by the Council, and the names of the persons who prompted that body to act as it has done.

Having read the comments which have recently appeare ${ }^{\text {l in }}$ the horticultaral press on Mr. Barron, the superintendent of the Royal Horticaltaral Society's garden at Chiswick, to-day I visited and criticied the work which was being carried on in the experimental gardens of the society. I was mach atruck with the great improvement in the condition of the place and in the caltivation of the plants, the success of which is due to Mr. Barron. A few yeary ago, when I was on the council with Mr. Voitch, just after the society's fortunate expulsion from South Kensington, and when we all hoped that its pernicious influences had been buried for ever, the council was compelled from lack of funds to atarve the garden, the houses were dilapidated, and the place was very much under-manned. To-day I found the houses for the most part in good working order, although two or three would be better if replaced by more modern atructares. The collection of Apple and Pear-trees I have never seen in better condition, and it contraste favourably with my own. I saw no evidence of blight. Of course, in anch a large collection there always mast be some treen which are out of healtb, and which require to be renewed. The collection of Figa looked well; I know of no place where such a collection can be found. Thone interested in Grape cultivation should make a atady of the collection. The hardy annuals and herbaceous stuff looked grand, and no did the plots allotted to the seed trials. I cannot conceive the peason why the council should have called apon Mr. Barron to resign. He is a man who in known to every horticultarist whose opinion is worth heving, to be atraight and unbuyable, a quality aboolutely necessary to give confidence to the trader and amateur. Those who are intimately acquainted with the idiosyncranies of gardeners, know the value and the rarity of these qualities. If it is true that the Chiswick, the Frait, and the Vegetable Cummittees who visit many time in the year the gardens, and who are responaible for its management, have not been conaulted by the Conncil on this matter, and that outsiders have been called in to report, the conncil have pasaed such a vote of censure upon the members of these committees that no man with a spark of self-respect conld continue to serve upon them, and it is for them to renign en bloc. If it, however, meane a new departare in the management of the gardent, the fellowe hould have been consulted and made acquainted with the proposed new acheme. If it is intended to attempt to make the gardens a profitable undertaking, a sort of bastard market-garden, the Mizens and the Pouparts would rery moon knock the bottom out of such a competitor. If, however, it is intended to convert the garden into a third-rate nursery for the sale of cheap plants, the Banyards and the Pearsons can tell the Fellows that such a scheme mast result in failure and bankraptcy. But should the conncil deaire to make the gardens into a public resort for narse-maids and their followers, wuch as is to be found in London quarse, the sooner the society gives up these gardens the better, for to apply the eabacriptions of the fellows to either of the parposen wonld be little better than obtaining money by false $p$ etences. It is my intention, as an owner of an expurimental garden, and one who for over twenty five years has some slight acquaintance with the work which can be succeasfally carried on in mach a garden, and one who loves horticulture for horticultarn's sake, at the first opportunity I have determined to ank for definite information as to the council's remarkable and anintelligible action. Should the answers which I receive be not astisfactory, I shat feel it my daty to submit sach resolations for the consideration of my brother horticalturiats an the answers may neem to neceasitate. I feel that for the society to lose the services of Mr. Barron, who has still many jears of aefolal work left in him would be nothing lese than a diagracefal job, and would be prejadicial to the beat interests for the advaocement of horticultare in this country. A. $\boldsymbol{H}$. Em.e. The Grange, Carshalton.

APAICOTS FROM BTANDARD TREES. - I am mending you some specment of Apricot grown on a atandard tree in the middle of my garden less than siz miles from Charing Cross. In the exceptional year, 1833 the tree bore over 600 fraits, and this year it ban done very well; and even last year, in maatiafactory weather, there was a fair crop, for altbongh the fruit did not matare to the extent one
could have wished, it made excellent prenerve Possibly, if the attention of fruit-farmers is called to the subject, the thoussads of pounds which are paid annually to the foreigner for this fruit may be kept in the country. M9 tree, which was brought from France, thriver well in the London clay, is and alwaya has been very healthy, and has never had an oznce of manare or a particlu of attention. What more could the farmer want? B. G. Jenkins, West Dulwich, August 26. [Tae variety sent by our correapondent was that capital early one, the Breda. Ed.]
kölreuteria paniculata. - This Chineee tree is well adapted for pleasure-grounde, owing to its pretty Acacia-like foliage and yellow-coloared inflorescence. I recently saw the tree in perfection in the grounda of Mr. H. J. Selwyn, Eatwood Hoase, near March. The tree stand on the lawn near the residence, and is ahout 3 ) feet high, with a head of about the same width, and on every shoot (and there are thousands), there is a beautifal panicle of flowers, 1 foot long. A close examination of the flower reveals a tinge of red in the centre. It in not a tree of rapid growth like the Ailanthus, but the stem of this apecimen is quite 5 feet in circamference at 3 feet from the ground ; and I have lately measured the stem of a Kö reateria growing here, which was planted fifty years ago, and find it to be $3 \frac{1}{2}$ feet at 3 feet from the groand; the appcimen seen at March will therefore be of considerable greater age. 4. Harding, Orton Gardens, Peterborough.
robe mrg. W. J oqant (byn. belle bie. BRECHT).-Herewith we enclone you Mensrs. Siebrecht \& Wadley's letter, correcting the statement made by them in your issue of June 15 which we will be glad if you will insert in your next isene. On February 2t, 1893, this firm wrote to unsaying that they wished to change the name of the $R$ from Mra. $G$ ant to Mra. Cleveland, and that thay hoped we would not oppose them. Wo replied on March 8 as follow:"With regard to your desire to change the nama from Mra. Grant to Mra. Cieveland, we cannot off r any serious obj ction, although we moald feel sorry that auch should be done." Alex. Dickson \& Sons Sons of Newtownarde, Ireland, and in juatice to them, we wish to correct our tatement in our letter of June 15 as to the re-naming of $\mathbf{R}$ se Mra. W.J. Grant. We asid at the time of purchasing the $\mathbf{R}$ se we had Mesern. Dicksons' consent to change the name. In this we regret we were in error. It wat in the month of March following (1893) that we received written permiasion from Mesars. Dickeons. Siebrecht \& Wadley"

## SOCIETIES

## ROFAL HORTIOULTURAL

Aucost 27 -An ordinary meeting of the committees of the Royal Horticultural Society was held on Tuenday last in the Drill Hall, at Weatminater. Hardy and half-bardy flowers and ennuals were exhibited largely, and included firet-rate collections of Asters and Gladioli, and some novelties in Dablian. Orchids were not very numercus, bat an intareating diaplay was present. Before the Fiuit Committae were exhibited large collections of Apples, Pears, and Piams, but there were few firstclass novelties, the only award being for a new dessert Apple, and an ornamental Crab.

## Floral Committee.

Present: W. Marthall, Esq. cbairman; and Meare. O. Thomas, J. Fraser. C. T Druery, H. Herbet. J. Laing, R Owen. G. Sievent, J. H. Burr, G*O. Nicholson, C. E Prarkon, G. Gordon, H. S. L onard, H. Cannell, J. D. Pawle, J. T. B Peë, H. Tumer, G. Paul, C. Bheck, and H B May.
Mr. M. Paitcrard, nurseryman, Christchurch, had a pretty group of hardy flowers, in which were vory fine b'ooms of Gaillardias, large sprays of Lobelia cardinalis variety. Robert Parker, of excellent colour; Rniphofia (Tritows) Priszari, a large bold variety, recommended an Award of Merit. Lilium tigrinum splendens and $\mathbf{L}$. $\mathbf{t}$. plenum were well shown ; the pretty but seldom seen Astrantia Biebersteini was noticed; and Eupatoriume purpureum. varieties of Eelianthus, aud muy other good things were included in this exhibit. Scabiose cuncasica albe wae recommended an award of meri (Silver Ranksian Medel).
Messrs. PaUL E Box, the Old Nurserien, Chenhunt, had a collection of herbaceon Phlox in variety, most of them with large flowers, exhibiting considerable variety in colcar. large flowess, exhibiting considerable varioty in colcar.
 flowers (Silver Flora Medal)
An excellent collection of Phrynium variegatnm planta were shown by Mr. J. Oy vrard, Child's Hill, Kilburn. The plante were in 7-inch pots. large, bushy, and capital in colour; also some fine plants of Maranta major, with green leaves, and about 2 feet high (Bronze Bankoian Metal).
From Messra. Hueg Low \& Co., Clapton, were exhibited some nice plants of Krica mawmona, E. elate, a variety thet
 large, highly-coloured blooms, and its distinct and dark
coloured foliage. An improved form of Alocasia Lowi was likewise shown, in which the large veins are whiter, the
under-side of the leaf deeper purple colour, and the leaf broader than in the ordinary form.
There were a few exhibits of new Dahlias staged, and these included a stand from Mr. Chas. Turver. Royal Nurseriee
Slough. Varieties in this exhibit to which an Award of Slough. Varieties in this exhibit to which an Award of
Merit was recommended were Duoglas, a neat, faif-sized Pompon of rery dark crimson; Purity, also a Pompon, white, with a little cream about the centre; Nerissa, a charming little Pumpon, o! very delicate rose colour; and Fabio scarlet petals, and yellow at the base. Large show varieties similarly honoured were Mabel Stanton, cle ir full varieties aimilariy honoured were Mabel stanton, cle ir lul
yellow, good form, a little flat in centre as shown; and Dante, yellow, good form, a little flat in centre as shown; and Dante, which is very apparent. Among Cactus-flowered varietie which received Awarde, were Beatrice, rose-coloured, a com paratively flat bloom; add Leonora, of warmer colour, and the petals recarved towards the centro-a very preity and attractive fluwpr. Many other good varieties in each section were incl uded in Mr. TUBNER's collection.
Measrs. H. Cannell \& Sons, Swanley, Kent, exhibited a dozen fine bloomy in three varieties. These were all largeflowered bloms. Le Colose, red; Siam, a Aaked Vaniety.
crimson, purple, and white; and Grand Duc Alexis, handsome

Another collection was from Mr, G. Harmis, Scad's Hill Hou-e, Orpiagton, Kent, who had a doven very nice blooms. in four varieties.
Messer. J. Priv \& soxs, Norwood Bond Nursarien, 8.E. etaged aprays of a Pompon variety, named Tom Psed, a rosette of pale red with buff reverse.
A box with a dozin and a hall plante of Saxifrage marmentos tricolor superbs was exhibited from the Royal Horticul. tural Scciety"s Gardens at Chiswick.
Hybrid Fuchaias in sprays of considerable variety were shown by Mr. Prillip Fry, Addingtoa Greon, West Malling, and were of some interest.
There were very large exhibitn of Anters from Meemrs. Virich \& Sons Boyal Esotic Nursery, Kiog's Road, Chelaen, and from Mesgrs. DOBBIE \& Co. The large and splendid collection from Mesers. Veitce \& Sovs had been lifted from the ground, and putinto pots. The diff-rent sections ware fully representer, German Emperur. in white, blue, red, and other coloure, various coloured varietiee of the Pgony-flowered Perfectiou t. pa. crown or Cocardeau Asters, with whice centre; Pompon imbricated, dwarf Chrysanthemum-fluwered, rose-flowered. Jewel Asters; Peony flowered globe Asters, \&c. A lew plants of the Diadem Aster had a nuwbur of emall blcoms. something lifelarge Daigiee, white and red florets mizen; and a go: batch of a rose bediog Anter was good (Silver Flori Medal). Mesar8. Dobs'E A chllection from the bursery at Orpington, Kent. contained very good blooms in quality, and there were sprays of most of the sections above noticed. A pretty show of Comet Asters was made also, and the colours generally were commeadable (Silver Banlasian Medal)
Messrs. Kelway \&c Son Lanaport, Somersetshire, stager] one of their remarkable exhbity of Gladiolus aprays in large, and fipely co oured. From a number of attrac tive novelties, the following were recommended A wand
of Merit: Kate Rose, a bloom of the largest with redcish-purple base, the same colour extendage alomes centre of bottom petal; Brantford, an excasding rich orisuan very glowsy: and Dolops, very large, richly-colourad flower and proctily-marked throat (Silver-gilc Elora kedal),
Mr. J. F. McLeod, ET. 6o J. E. Mongin, Enq, DJvar House. Boehampton, Surrey, thamed a magaificent group of Crotona. remarkablealise from the exeeptional cultivation the plants exhibite ${ }^{2}$, and the reprementative character of the varieties, many of wich are recent ones. Broad, medium, and narrowleaved rericties wore apranged with a view to obtaining the best effect, and were liberally interapersed with Adiantum cuneatum. Among the most telling broad-leared varieties were Reidii, Mortii, Andreanus, and albicans. The marrow and medium-leaved varieties were more largely shown, an we noticed very pretty plants of A;gurthirnsis, Golden Bing. pistaratus, Lord Chelmeford, Laisgi, Nestor, angustifolius, Mrs. Doman, and many others (silver Floza Medal).
Mr. T.S. WARE, Hale Farm Nurseries, sent a large numbet
type, and others with blood red stripes along the petals in areater or lees degree. Also a apray of L. nepalense, and a fem good varietier of Dahlise.
From Meears. H. CaxsELL \& Sovs, Swanley. Kent, was exhibited a collection of Cocksecombs, and a grod number of pots of some of the best varieties, and some excellent plants of seedling doablo Begonias were also shown by Moesrs. CANNELL (Silver Flora Medal).
A very extensive group of hardy flowers came from Mesess, P. Bark \& Sons. King Street, Covent Garden, London. Wo noticed many excellent varieties of herbaceous Phloz, Gladioli, Marigolds, Pyrethrume, Helianthus, Gaillardias, and other teasonable plants (Siiver Flora Medal).
An Award of Merit was recommended to the ornamental Crab, Joo. Downie, shown by Messrs. Geo. BuNyARD \& Co. shape, and highly coloured.
For Messrs. KELWAY \& Son's prize, offered for the beat collection of twelve Britiah-raised Gladiolus gandavensis vars., there was only one competitor, namely, C. F. THOMPSON,
Raq, Llandaff, Cardiff (gr., Mr. Mann), who was awarded the Raq, Llandaff,
Medal otiered.

## Orchid Committee.

Present : Dr. M. T. Mattert, in the chair ; and Mearrs. De B. Crawshay, T. Statter, J. Jacqué, E. Hill, H. M. Pollett, W. H. White, J. T. Gabriel, H. J. Chapman, T. W. BJnd, W. Cobb, A. H. Smee, and H . Ballantine.
An interesting if not a grest number of exhibits occapied the labours of the committee on this occasion, although There were not many of extraordinary merit amongit them. Chelsea, came the followiog: Cattleya Eldorado alba, an entirely white-flowered variety, excepting the throat, which is yelluw on the inside; several pieces of C. Dowiana, nicely bloomed; Miltonia vezillara superba, in colour a rosy-lilac, therefore novel as regards its shade of colour ; Leelio-Cattleya Proeerpine, out of Cattleya velatina $\times$ Leelia pumila var. Dayana. It has sepals and petals of lurid parple, a rich purple lip, passing to a light tint at the apex, and furnished with white lines at the base. The following Cypriperiums were shown, Chas. Canham $=C$. villosum $\times C$. superbum, C. tonsum superbum, a flower caainly green in colour, save for a buff suttusion, sud the dorsal sepal is tipped with white, and lined with light brown-it is a striking variety; $C$. Warnhamiense $=$ Phillipense $\times$ C. Cartisii, chiefly dis superbum $=C$. inaigne Maviei $X C$. Harriaianum, flower of nich shades of brown, at seen in the lipe and petals, greenishpurple in colour as regards the dorsal sepal, which has purpio lines, and an edge of white; the lower sepal is green, with yuple stripes running through it perpendicularly, a distinct and pleasing variety. In this collection, a plant of Vanda Sanderians with extra large-sized flowers, was re-
marked; the rare Grammatophyllum Rumphianum, bearing marked; the rare Grammatophyllum Rumphianum, bearing
a drooping spike a yard in length with greenish flowerg parely arranged on it-the latter are two inches in width, preenish-yellow, with irregular brown blotches. $A$ plant of Coelogyne Veitchi, having white flowers with buff-coloured remains of the onvelope remaining attached to the footatalks (An Award of Merit). For the entire exhibit, a Silver Flora (An Award of Merit)
Mesars. H. Low
Mesars. H. Low \& Co., Clapton, showed Dendrobium speciosum, described in these pages (March $\theta$ last), a small plant, with two or three flowers; Cycnoches chlorochilon, in male and female forms, interesting but not beautiful; BolboWhyllum Dearei; Cypripedium Charlesworthi unicolor, the colour of the lip being the same as that of the sepals and petals, instead of brown; a good form of Lselia elegans ; a beautiful flowered spray of Odontoglossum Harryanum, the best variety of it, with the white lip which turns jellow with age.
Meness. W. L. Lewrs a Co., Southgate, had small groups of Archids, amongt which were noticed Cypripedium Charlesworthi, C. Evenor superbum, a flower with a fawn-coloured ground coloux; petals thicly spotted with purple, and the lip near the orifice furnished with brown striation. They showed Miltonia epectabilis virginalis, all parts of which flower are white, excepting the bese of the lip which is parple. It may improve with age, bat at present it is not apparently of much
monit. Cattieys gigas, C. Parrieonise, Hobenaria Suzannae, and Odontoglosum Lindleyanum, were among the other object shown by this firm.
KDWARD WOODALT, Req., Scarborough (gr., Mr. Hughes) showed a grand piece of Odontoglosana coronarium. Salt's var., recaiving for it a Cultural Commendation. The same exhibitor had a magnificent panful of Vanda coe:ulea of the best type of the ipecies, the flowers measuring 4 inches across. and there were seven well-furninhed flower-apiles. Some Cypripediums were likewise shown.
A aplendid dark-coloured form of Leelia elegans Owenise, with a lip of the richest purple, was shown by THos. Statrer, Rfy., Manchester (gr, Mr, R, Johnson). His other plants consisted of Oattleya grattata Leopoldi, C. Rox, Leelia elegans phasiaty, L. ex. excellens, each differing from the type; LeelioGnetleya Nysa $=$ L. crispa $\times$ O. gigas; C. Gaskelliana alba, C. aures, Dendrobium Phalsenopsis Schroderiamue, fowers of fir sine, the colour light, approaching white; Leelio Cattlfya sebeuals, the last-named receiving an and L. elegans Chelgroap was awardeu a Silver Flora Medal. Merit; and the uf Lalia elegans aame from Fiora Medal. Another plant Ahtom-on-Mersey (Er., T. Staffurd), ria., L, Req. Tynterfield, the same amatear came Levlia-Cattleya, Hardyans, the From croes of L.-C. callistoglosma, C. gigas Sanderiana, having been
used instead of C. gigas. The flower is of rosy-lilac in the sepals and petals and tube, with a lip
shade of purple and of velvety texture.
Mesors. F. Sander \& Co., St. Albins, showed a group of Orchids. There were Habenaria cannea var, nivosa; $\mathbf{F}$. Hardy's variety of Cattleys surea, paler than the type, for which a First-class Certificate was given; C. a. Statteriana, Miltonia vexillaria var. rubella, Burlingtonia pubescens, the white and the rose-coloured varieties of Dendrobium bractescens, D. oruentam, D. Phalenopais Schroderianam in variety, and L.erio-Cattleya Fowleri. For an illustration of this beantiful cross between C. Leopoldi and C. Hardyana, see fig. 47, p. 239. A Silver Banksian Medal was awarded the exhibitor. D. B. Crawshay, Esq., Rosefield, Sevenoaks (gr., Mr.
Coole), received a Cultural Commen dation for a plant of Cooke), received a Cultural Commen dation for a plan
Messrs. B. 8. Willians \& Son, Paradise and Victoria Nurseries, London, N., showed a small group, consisting of
Pachystoma Thomsonianum, white, with a narrow, elongated lip of a purple tint; Odontoglossum Krameri, a flower of pale lilac, \&c.
From the gardens of Sir Trevor Law rence, Bart. (grower, Mr. White), came Dendrobium Hookerianum, a plant with a pleasing inflorescence of lemon yellow-coloured flowers, having a dark parple blotch at the base of the friaged lip (Award of Merit). Other plants consisted of Stauropsis Phillipinense, a plant with buff-colour blossoms of starry shape springing from the leafy nodes of the stem, the lip narrow, and strap-like, and pale lilac in hue; Onoidium hæmatochilum, Catasetum Bungerothi, with unusually large flowers, for which last a Vote of Thanks was accorded.
A. H. Smee, Esq.. The Grange, Wallington (gr., Mr. Cummins), showed a form of Catasetum fimbriatum, Eranthus grandifolius-a remarkable bloom of a creamy-white tint, whose petals, sepals, and lip at the extremities turn of a prim-rose-yellow hue as the flower ages (Botanical Certificate).
Chas. Ingram, Keq., Elstead, Godalming (gr., Mr. Bond), Elsteadensis $\times$ Catt. maxima (an Award of Merit). The bloom has light purpla-tinted sepals and petals, and an intense purple coloured lip, which in spread out fanwise, and is frilled at the edges; at the sides of the throat are bands of a yellow hue. The parent plants were shown, and the child is a decided improvement on them. From the same exhibitor came LrelioCattleya Elstead Gem, sepals and petals orange-coloured, tube white exteriorly, and lips a rich parple colour (an Award of Merit for this last).

## Fruit Oommittee.

Preant: P. Crowlay, Eqq., in the chair; and Meostr. W. Wilkt, T. F. R. Rivers, G. Banyard, H. Pearron, G. W. Cammins, T. J. Saltmarrb, J Veitch, A. Dean, J. Wright, J. T. Milee, J Willard, W. Farr, C. Herrin, H. Balderson, F. Q Lane, and G. Norman.

Mr. J. W. Miller, gr. to Lord Foley, Rurley Lodge, Esher, staged a collection of fruit, including several commendable Melons, a nice lot of Brown Turkey Figs, some Yorkshire Beauty Apples, and a large dish of excellent Hemskirs $\Delta$ pricots (Vote of Thanks).
Mr. Owen Thomas, gr, to H.M. the QuEeN, Royal Gardens,
Frogmore, exhibited a meritorious collection of Plums in Frogmore, exhibited a meritorious collection of Plums in
thirty-eight varieties. Of large red fruits, we noticed Victoria, Autumn Compote, and Pond's Seedling, noticed Victoris, there were Archduke, Fellenburg, Prince Engleheart, Kirke's, Large Black Imperial, Diamond, and others; also Jefferson's, Belle de Septembre, Coe's Golden Drop. Magnum Bonum, Lawson's Golden Gage, Damsons, Bullaces, \&c. Mr. Thomas also showed a pair of nice-looking short Cucumbers, named Frogmore Prolific (Silver Knightian Medal).
An extensive collection of first-class fruit was exhibited by Mesgrs. Jas Veitch \& Sons, Royal Emotic Nursery, King' Road, Chelsea, which included Apples, Pears, Plums, \&ce, in variety. Among two dozen dishes of culinary Apples, we noticed Stirling Castle, Lord Derby, Lord Suffield, and Eeklinville Seedling as commendable. Dessert kinds were represented by Duchese' Favourite, of very high colour: Davonshire Quarrenden, Lady Sudeley, Karly Strawberry, Early Joe, Karry Pippin, Yellow Iageatre, and Worcester Pearmain. There were several dishes of Pears, including Fondante de Curne, Beurré d'Amanlis, Fondante d'Automne, Souvonir da Congrès, tec. Plums were hhown in a lasge number of varie tie, genarally of excellent quality. Several diehes of Peaches from trees in pots were good, and included Barrington, Grawfond's Rarly Violette, and others. An Award of Merit was recommended to an omamental Crab Transcendent, some very The fruits are uncomich wore exhibited together with sprays. conical in shape than thenly highly-coloured, and are much lese conical in shape than the variety John Downie, also Certificated. Two new Apples were also shown, Beauty of Moray,
green culinary variety; and Temple's No, green culinary variety: and Temple's No. 1 , a high-coloured
dessert variety. Neither of these were cartificated VEITcH's excellent collection was awarded a Silver-gilt Kaightian Medal.
Mesars. S. Spooner \& Sows, Hounslow, contributed a collection of fruit in fifty dishes, including an excellent lot of Apples and Pears; also a few dinhes of Plums, \&
Medal). (Silver Banksian
Favouriten-coloured Tomato and plant named Edmonscote Castle Hill, Kaling, W. R, DAviry, Rsq. Edmonscote Houve, beariug French Bean named Syon House Prolific, was shown by Mr. G. Wythes, gr. to Earl Perct, Syun House. Brentford. Mr. A. G. Hoolings, gr. to W. H. HARFORD, Esq., Almondsbury, also showed a very freebearing Bean, with large coloured

A brace of Cucumbers named Eamee' Hybrid was shown by Mr. F. K EAMES, Twickenham. New Melons were my
hibited by Earl Percy (gr.. Mr. Wythes), and Earl Dion Knowsley (gr., Mr. Robt. Doe), but no awards were mader, Knowsley (gr., Mr. Robt. Doe), but no awards were made. dishes of a good Perfection type Tomato named Cansell! King; and Mr. W. Rapley, gr. to H. Grimling, Esq., Hann Weald House, Stanmore, showed a dish of Sutton's Pertection Tomato grown out-of-doors; the quality was very good. medium -sized Pea called Selected was exhibited by Mr. Tro McJlure, Hartley Grange, Winchfield; and from Mr. W Potten, Camden Nurseries, Cranbrook, wore some fruit Malus baccata fructu maximo, a large form of the Sibatin Crab.
Messrs. Geo. Bunxard \& Co, Maidstone, were sea mended an Award of Merit for a rather large dessert $\mathrm{A}_{\mathrm{j}}$, named Williams' Favourite. The fruit as shown is conim very highly coloured, the colour extending almost ovar the entire surface, flesh tender and sweet.
Fruits of a seeding Peach came from the gardens of ha T. D. Aclakid. Killerton, Devon. In appearance the fritu resembled Royal George, but it was a clingstone.

## Lecture on Codiæums and Dracænas.

In the afternoon a paper by Mr. C. F. Bame oa the "Calture of Crotons and Dracenas " wa rail by Mr. Geo. Banyard.
The writer firat dealt with Crotons, and recommended oight temperature during winter of $60^{\circ}$, and in spring about $5^{\circ}$ or $10^{\circ}$ higher. Many of the varieties may be prown without
shading, but during the summer most of them would roquim a slight and removable shade at mid-day. Syringing during the summer months was a very important operation, and should be done in a thorough manner in order to leep sub spider at bay. Drought at all seasons is highly injurious. A good potting compost for the plants would coasist of two parts good rich loam, one part leaf-soil, and some sand. The plants should never want in the least for water, and they should always be given a very light position. The aral method of propagation was by cuttings, which should be made with a clean cut by a sharp knife directly under a mole The pots should be plunged in Cocos-nut fibre or other suitable material in the propagating-case, and the material rept daw at a temperature of from $75^{\circ}$ to $80^{\circ}$. When potting the cuttings off, a lighter soil ahould be used than that reammended for established plants. The ringing procew de might be used with advantage. Seeds of Crotons should be sown as soon as ripe.
Dracenas.-The different types were alluded to briefly, and the particular uses to which they would be advantagsouly fought, and it was necessary to syringe the plants vert thoroughly once each day. The roots should be kept in a regular state of moisture, and the plants watard
whilst moderatoly moist. For potting, \& compost midst be used of two parts fibrous loam, one part lest soil, and one part peat. The Dracrenas were propagated by roots, cuttings, stems, and seeds. Varietice of the Goldiams type should have the top cut off and grown, and the 唯 would continue to break, when each growth might betaw off and struck. Indivisa and australis varieties wore usally raised from seed.

## SHIRLEY

AUGUST 21.-The present was the thirtieth numut show held by this society, and was in every way anccess. Group of miacellaneous planta arrais for effect were a featare, so well were they done.
Mr. Wills, nurseryman, Shirley, gained the premier amad; Mr. Peel, gr. to Mise TODD, Shirley, 2nd. Specimen store wir greenhouse plants were numerous and good. For six, Amys, gr. to Hon. Mrs. Klliott Yorke, Hamble Southampton, won easily; Mr. WrlLs 2nd.
came from Mr. G. Hall, gr. to Lady Louisa $\Delta s H B U R T O S T$ Melchet Court, Romsey. Mr. Mitchell, gr. to J. Whis Fleming, Eieq., Chilworth Manor, won for tuberous Begaive Mr. Wilcox, gr, to Col.W. Sinkins, Aldermoor had the finest Fuchsias, really good examples.
Cut flowers were bright and varied. For twelve Rolat twelve show, six Cactus, and six Pompon Dahlias, and trande four Asters, Mr. Weat, Gr. to J. W IGRAM, Esqu, No Lumin Salisbury, won in all the classes referred to. Mr. Lrale then
won for twelve epikes of Gladiolus-really good exampe won fo

## Fere

Mr. MIT was an important feature of the show. For sis wis Wilcox had the beat Black Grapes, Mr. Mrrcerisis the White, both reprosentative of the kinds staged. Mr. Man Peaches and dessert Apples. Mr. AMYs had a and secured lst prize.
Vegetables were especially numerous. For a colloction sir varieties, Mr. Russell, Nursling, was eamil, Mr. Hollow the prizes offered by Messis. Toogood \& SoNs, Ming ansh gr. to A. Browr. Req.. Shirley, secured the leading anm

## BASINGSTOKE.

Avaust 22. - In the grounds at Eautand, blate ing to Mra. Millar, the annual summer ext. Phat was held, and was in every way a succe.
formed an important feature of the show. 0 . Hours.
For twelve specimens, Mr. Bowerman, gr. to
flowering plants exhibited much merit. Mr. T. Weaver, gr. to W. O. Gilcirist, Beq., Oakley Park, Basingstoke, was 2nd.
Groups of miscellaneous plants arranged for effect were meritorious, Mr. Bowerman taling the lead in this class. Mr. Best, gr. to F. D. LEyland, Ksq., The Vyne. Basingstole, 2nd.
Mr. Weaver won the premieriaward for exotic Ferns with hoalthy examples. Mr. Best had tho best table plants and taberous Begonias.
Mr. Ruseell, gr, to W. Bradshaw, Ksq., Audley's Wood, Basingotoke, Whs lst for Coleas and Fuchsias, both meritorious oxhibita.
Cut flowers were shown in quantity, and made a bright display. Mr. Neville, gr. to F.W. FLIGHT, Esq., Twyford, Winchester, won the premier award for twenty-four and for twelve blooms of Roses, with particularly bright and freeh blooms. This exhibitor also woa for twelve show Dahlias. For twelve bunches of any kind of flower, Mr. WeAVER was distinetly 1st; and Mr. Russeci won in the herbaceous class. Ladies made a creditable display of flowera in a separate tent.
Frult was shown in good quantity. For a collection of six varieties, Mr. F. Cole, gr, to Sir G. Bueselis Swallowfield Parr, Reading, won with a good all-round collection; Mr. Bowerman following. Mr. Cole also won for three bunches of Black Hamburgh Grapes; Mr. Osman, gr. to J. G. $B \perp K E R$, Esq., Ottershaw Park, Chertsey, was 2nd. In the class for any other black Grape, Mr. OsMaN staged well-finished Alicante; and Mr. Cole was 2nd. In the white Grape class, Mr. Bowermar won with Muscats.
Barrington Peaches won for Mr. Bowerman premier award for one dish; he was also let for a green-fleehed Melon. The finest Nectarines were staged bv Mr. Holdaway, gre to Lieut.Col. MAy, Hawlfield, Basingstole.
Apples made a large display. For three dishes, dessert rarieties, Mr. Best won; and for a like number of kitchen arieties, Mr. Dauncer, nureeryman, Hook, was easily lat.
For three diohes of Plums, Mr. Fulford, gr. to the Earl of Nelson, Trafalgar House, Dorset, won with choice kinds.
Vegetables are always well staged here. Mr. Bowerman won lat prize in each of the three collections of six varieties, with superior produce; Mr. BEsT, and Mr. Kneller, gr. to Wyndeam Portal, Esq., Malshangor Parly, coming next ia their respective clasees.
Mrs. Lidiams, Shirley, made a grand display with a large bank of herbaceous flowers, arranged in an effective manner; a smaller yet choice collection also coming from Mr. JıokMan, Woking.

## MANCHESTER ROYAL BOTANIC

 IILY AND FRUIT SHOWAvarst 22 to 26.-An exbibition where Lilien form the chief featare is altogether a novel one. To Mr. Bruce Findlay muat be voted the credit of bringing together auch a variety of Lilies in flower, that it in not the lot of the general pablic, and even of many gardenera, to have meen. Moreover, nearly the whole of them were shown in pota, 8 matter of cultural importance, and an object-lemen to all who inspected them, presenting an impoing array, tet in the aloping, undulating banks of the annexe, a building eminently fitted for displaying to the bent advantage pot-plante of every deacription. The foral cene was amplified by splendid assortmente of Gladioli, and border cat flowers in poaies of every hue. The fruit was not a large exhibition, and was not particularly notable, with the exception of some well-coloured bunches of Mascat Grapen. The opening-day was a propitious one, but the attendance was not such as a charming exhibition of thin kind ought to have commanded.

## Lilies.

By far the finest lot of Lilies came from Menars. R. Wallace - Ca, Colchester. The auratum section comprised some beantiful forms, among which we noted the magnificent rubybanded variety, rubro-vittatum in several lote, the gorgeous broad-segmente i platyphyllum, 80 prominently banded and spotted, and the plants bearing ahort stems carrying goodsized flowars, the white form of this under the name of Virginale, is an imported gem. with its minutely spotted flowers and prominent golden band down centre of each segment; thea Wittei, as white ss specionum album itsolf, only having a faint yellow band down contre of eegments. Batemanio is one of the most striking of the Ieolirion type, bearing glowing apricot flowers, almost unspotted. Among the speciosum group Melpomene is a suparb variety, making a aplendid exhibition plant, the vivid crimson-purple blotches and the white margins readera this form one of aingular attraction. Specosum slbum was in several varistien, the Kratzeri form beltg pure whits, and the album having prominent golden anthers. This group is always a telling one, and although the numbers renerally were limited beoause of the season, they atill take front rank in Lily mixtures. Longiflorum giganteam was very prominent, even beating for quality the ubiquitone Harrisii. The chief novelties and varieties were Lo Henryi, called the orange-yellow very free flowerer, some of the spikes bearing twenty flowers and carrying good foliage, the filikes beariog twenty flowera, under glass, and out in the open, the latter mode emphasizing the orange colour. The groups of this species here commanded
general attention and observation. L. Leichtlinii is a very charming Lily of the Martagon group; colour. yellow ground, covered with purple spots. L. nepalense is a pretty combi nation of brownish-crimson and citron. Another of the funnel shaped section, named Lowii, is striking in having its interio covered with purplish spote. L. tigrinum Fortunei giganteum is a gigantic form of the type, bearing larger flowers, and in greater number than the type. The old double Tiger Lily slways tells well in a group. This firm also showed a new form of Hemerocallis, under the name of Aurantiaca major, which received a First-class Certificate. The collection, as a whole, obtained the Society's Gold Medal, and it richly whole, obte
deserved it.
Mr. Húd
Mr. Hudson, from Kilburn, showed over a hundred pots, comprising chiefly forms of auratum and speciosum, the white ones being less numerous than the coloured-spotted ones. It was an effective groap, however. Mr. Findlay put up a large group, mostly of the auratum and speciosum breed, and in the course of a few remarks he made at the luncheon, he advised all gardeners not to try and force speciosum Lilies, because they would refuse to be conjured into flower under the the wisdom of his range completely flled with Lilies which in another fortnight would be a blaze of beauty, but nothing short of sunshine and time would effect the evolution of the flowers. Messrs. J. \& time would effect the evolution of the flowers. Messrs. J. \&
R. Thyne, Glasgow, sent a very good lot of L. auratum, in R. THyNE, Glasgow, sent a very good lot of L. auratum, in
which the large platyphyllum were represented, also some which the large plat

## GLadioli, ETC

Next in importance to the Lilies were the Gladioli, particularly those from Kelway \& Son, Langport. There were hundreds of them, and all clean and beautiful. Among the very best were Mr. J. Eyton, white, shaded rose; Lord rothe with rose venation ; Rev. H. H. D'Ombrain, cerieo nad white throat, splendid substance; Mr. Fowler, carnation, with yellow citron, carnation, good form; Fiducius, crimson, yellow citron, carnation, good form; Fiducius, crimson, deeply shaded centre; Maori Chief, mulberry, crimson
blotch; Duke of Edinburgh, rase and purplowhite throat. Among new ones we noted as best-Acis, marbled scarlet and purple, very stylish; Mus, deep velvety, crimson shaded, fine substance; Milus, beautiful shining heliotrope, with whitish base; Mano, maroon crimson, tender, of grand form and subetance; Pine, orange-scarlet, purple lines; and Madame Calve, shaded orange and suby blended. This firm also exhibited a splendid lot of Gaillardias, of which Vampire may be said to be the chief; and the free-fiuiting Japanese Wineberry, Rubus phoenicolasius. This makes a handsome plant. with fine ovate acuminato leaves with a profusion o rich scarlet berries crowded together, of prominent vinou
flavour. Along with this among others were the show flavour. Along with this among others were the showy gellow-flowered Rudbechia lacininth, and the
long bpikes of Veronica longifolia $\varepsilon$ ubecasilis.
Mesors. BARR \& Son had several Lilies in their collection, the double-flowering Tiger Lily not being the least effective o them; and the fine orange-scarlot Montbretia crocosmeflora along with Lobelia Queen Victoria, a brilliant form of the fulgens type.
Mr. ANTHONY WATERER ment cut sprays of the new Spireas Anthony Waterer in rather pretty ruhy-coloured thyrues. Menses. Diozson, Browr \& Tait sent a lot of cut Gladioli, set among nice dwarf greenery. Mesars. Diokson \& Robinson had very good ascortment of H. P. and Tea Roses; among the latter. Madame Hosta, a jellow, was vary prominent. Mr Jotiv Kirson, Altrincham, had a miscellaneous lot of hardy JOHV KITsON, Altrincham, had a miscllaneous lot of hardy
border flowers, nothing so fine as the varied Snapdragons border flowers, nothing so fine
Which are again coming to the fore.
Mr. Frank Liw. Sale, put up a grand assortment of cut flowers, such as he supplies daily to the Manchester bazaar trade. They were arraoged on a central bed, in which Kentia Fostriana was the fountain-like apex-sand beantiful they looked. They comprised Gladioli, the best market flower in that way being the scarlet Brenchleyensis, then Phloxes, par ticularly the late white; various kinds of border Chrysanthe muma, the charming white Mignon Aster, than which it has no rival for purity and form; fine posies of varied Zinnias, yellow Papaver, and also the deep pink variety, more beautiful when cut than to look at them in the plants; Germania Carnations, of fine sulphur colour; also a new border one very double, and of good form-carise, called Mrs. Frank very double, and of good form-cerise, called Mrs. Kran Sultans and Coreopsis, and Gaillardias; and Centaureas forming a group for brilliancy of these simple border flowers that may be equalled in the other departments of Flora, but could not be excelled.

## Eruit

Comprised collections of ten sorts, Mr. Goodacre, gr. to the Earl of Habaivorox, hed good Muscat and Black Bamburgh Grapes, a Queen Pine, Bellegarde Peaches, ELrage Nectarinea, a good Victory of Bath Melon, Downton Plums, and Jargonelle Peara. Mr. W. Wallis, Kr. to R. SwEYD, Baq., Keele Hall, was Peara. Mr. W. Wallis, igr. to R. SMEYD, Baq., Keele End , Wack
2nd with, among others, Peareon's Golden Queen and Black 2nd with, among others, Pearson's Golden Queen and Black
Hamburgh Grapes, Walburton Peaches, Golden Drop Plums, Hamburgh Grapes, Walburton Peaches, Golden Drop Plums,
and Negro Largo Vige, Mr. Slade, gr. to the Duke of Nuwand Negro Largo Vige, Mr. Slade, gr, to the Duke of New-
CastLe, was 3rd, havin, Mascat and Hamburgh Grapes, a Castle, was 3rd, havin, Mascat and Hamburgh Grapes, a
small Rine, and several other dishes, of which the Hero of small Pine, and several other
Lockinge Melon was the beet,
For the beet twelve bunches of Grapen, Mr. Goonicme wat 18t, with a showy lot, beantifully finiehed, but the bulk of them having mallinh borries. The Muscate here were good, considering the time of year, being of fair aize, good colour, and proper form; there were five bunohes of them in the eollection; then good-berried bunches of Gros Maroc; faimesed bunches, finely-finished, of Barbaroess, but berries jenall: and a pair of Alnwick Seedling.
Mr. Elphintone, gr. to S. M. MUNDAT, Eeq.,.Shipley]Hall,
had also a remarkably good lot, many thinking that the prize hou:d have been reversed; but on close examination the judgment appeared to be perfectly mound. This lot also com prised four good bunche of Muscat of Alezandrib, two of Alnwict Sordling, two of Madresfeld Court, and two of Black Hamburgh. The bunches were smallish and so were the berr es, $b$ it the finish and the staging ware without blemish. Mr. Tillott, gr. to Lord Barnaris. Raby Caatle, had very gooi Muscar of Alezandria. For six bunches of Grapes. Mr. Elphinsione and Mr. Goonacre exchanged positions, the former grower having lat, with three good bunches of Muscat of Alexandria and three Madresfield Court, the latter ex Libitor haviog aleo prime Museats, fairly good Fuster's Seedling, and Madresfeld Court. Mr. Richardson, gr. to J. E. Platit, Eeq., Cheadle, had fairly nood Muscat and Gros Maroc Anextra prize was awarded to Mr. Wallis, Koele Hall, for his aix bunches.

## SHOW REPORTS, \&c., DELAYED

An anexpected demand apon our space unfortanately compels us to keep over until our next issue reports already in type of exhibitions held at Bath, Brighton, and other matter.

- Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Out contributors, who well know what this implies, witl woele as possible. Communications should reach us not later than week as possible. Communications should reach us not later than Weanesday.
** Plants, Fruits, etc., to be Named.-Cortespondents sending plants or fruits to be namod, or asking questions domanding time and researeh for their solution, must not expect So obtain an answer to their enquiries in the current week. Speeimens should be good ones, carefully packed and numbered, Fiorists varieties cannot, as a ruls be named. Leaves only, of Ants: G. T. C. The means of destruction may be applied at the present time. When it is seen by digging into the nents that the ante are dead, the former should be dug into, and the earth containing the egge ncattered on the arface of the ground. Domentic fowls, pheamant, \&c., would coon then make a clearance of these.
Astrns: Will your correnpondent R. King (p. 216) be good enough to nend me one of hir divenaed Astere with roote and roil adhering, aloo name and addreet, se I sm deeply intereatod in the matter, and may posxibly be able to give him information. E. Dawees Roseoroft, Hambledon, Hants.
Bansoos: J. R. Bambuna has the apikeleta arranged in fancicles, and the flowers have six atamens. Arundinarin ham many flowered apikeleta arranged in branched apiken, without any enveloping leaf, and the atamens are three. The canes sre cylindrical, with numerous bade at the jointe, as poiated out to us by Mr. Bean. Payliostachys has loosely panicled one-flowered pikeleta, sarrounded at the base by a large leaf, stamens three. The canes are flattened or grooved on one side, and only two thoote proceed from each node, Thamnocalamus is not essentialiy distinct from Arundinaria.
Books: E Tremeller. Handy.book of the Flowergarden, by D. Thomson (W. Biackwood \& Sons, needed. The lengh) will afford the information needed. The hetor edition conte $5 s$ - MARKET Gakdennag, \&e.: J. N. C. Tillage and Implemente, by W. J. Malden, pablished by G. Beil \& Soan Pork Street. Covent Girden. The New Potato Cultwre, by E. S. Carman, Rural Pablizhing Co, Now York. or through a foreign bookseller.
Kitchen and Market Garden, by variout writers,
pablished by Macmillan \& Co., Bedford Street, Covent Garden. Market Garden Husbandry, by W. H. Ablett, published by Cnapman \& Hall, 11, Henrietta Street, Covent Garden.
Ceps or Cèprs: Inquirer. The edible apecies or cep blanc is Boletus edulis ; the poisonons apecies are the cèpe noir, B. æreas ; and the cèpe faux B. laridas. There is no known method of caltivating them.
Correction.-In the report of the proceedings of the Royal Horticultural Society's Frait Com mittee, at p. 218 last week, Tomato Early July should have been credited to Laxton Brothers, instead of to Sutton \& Sons.-Hsmmeramith Hor ticultaral Show, Gardeners' Chronicle, August 3 p. 137. Mr. A. Salter writes to nay that his father did not escape with a fine China dinner-service, as there atated, and which the King Louis Philippe presented to him. We had no desire to impate dishoneaty to the late Mr. Salter, or that he performed anything more than a friendly aetion towarda the King.
Flora of Tasmania": The widow of the late eminent botanical artist, Mr. W. H. Fitch, devires to dispose of this valuable work. It in in parts, but the firat one is missing.
Fungus on Pins: A. L. Didymiam apumarioidea; one of the slime-fungi has overrun the Pinks, but it is not a paraite, and will do no harm, and will soon entirely disappear. G. M.
Gardeners' Orphan Fund, A aubscriber to the Gardewers' Chronicle begs to enclose a post-office order for $£ 1$ for the orphans of gardeners, in consideration of the Editor's kindness in naming her wild flowers, $H, M, E$. The amount has been received with vety many thanks, and is in the hands of the secretary.
Handling a Spade or other Two handed Tool: Spadesman. When the left hand is used lower down the handle than the right, the ueer is naid to be "left-handed," notwithatanding that he is, where one hand only is brought into use, a righthanded man,
Judene at Flowrr Shows: R. C. W. 1. The group contest being for plantr in pota, the cuttingoff of the Bamboos and raing the stems, \&cc., as decorative material should have disqualified the exhibit. 2. Distinct species were doubtless meant by the framers of the schedule, and he who showed two A'alias was rightly put out of competition. 3 Cycads are not Palms.
Lettoces for Fobcing: W. D. The black-meeded Crisped Tennis Ball, white; Golden Tennis Ball, bat this variety noon bolts; and Tom Thamb. Sow in October on hotbeds, and grow entirely in frames or hand-glasens. We cannot give you any information about prices ; conalt our market re. ports of last winter.
Manore: C. H. W. If your land is light, let the manare be fairly decayed before aning it, bat if it be heavy, you may dig it in when halfdecajed. In any care, do not let it lie about in heapa, bat cover it with soil, banking it ap as you would Celery. Pour newage or house-mlopm into these, which will aid the rotting.
Maly Bug in Vineries: N. $Z$. We ahould be inclined to depend on Richarde' XL All Vaporiser for the dentruction of "bug." It is cheaper than hand-labour, and much more efficient, doing no harm to the frait, although we might havitate, for obvions reasona, to its use in vineries where ripe fruit is hanging; more than one application would be required. Could you not wait till the crop it conamed or put into bottles, when you could perhapa find a way to make the house airtight before uaing the vaporiser; in the meantime, using methylated apirite and a camel-hair pencil to kill "bug" wherever seen, eipecially about the banches.
Measurbment of Cubic Contemts of Glasshouse-a Lran-to: F. W. W. Firat find the area of a cros-section of the house up to the angle which the roof forms with the upright front wall or lighte, and then that of the angle formed by the roof, and a line drawn from the wall-plate horizontally towards the back wall of the hoase. Having found these meanarements, add them together, and multiply the total by the namber of lineal feet in the length of the house, and you will have the contente in cabic feet.
Natrs of Fretts: J. C. Bi 1, not known; 2, Daches of Oldenburg; 3, Raveleton Pippin.

Nambs of Plants: Correspondents not answerd in this issue are requested to consult the next number.W. M. Prunus Pissardi. There is no fangaiinsect on the Begonia, so far as we see. Is thero not some defect in the method of caltivation?N. C. 1, Linaria Cymbalaria; 2, Senecio viscomu 3. Chenopodium polyspermum ; 4, may be lesf of Spiræa Ulmaria; 5, Nicotianar rascica. Specimen withered, numbers detached mostly, figures neuly obliterated by damp. We do the best we can ander the circamstances. - Correspondent. Both Acm are forms of the Norway Maple, Acer platanoide, $L_{\text {, }}$ -H. M. E. Platanua orientalis, variety aceri-folia-often called the London Plane, as it in commonly planted in London. We never hend it called Indian Plane. - W. T. H. Gypaophils elegans.-A. H. Dasylirion acrotricham.-G. $A$, B $_{\text {. }}$ 7 , not recognised, flowers perished; 8, Leptor permum bullatum. - T. H., Ilkley. The fomm representa a very fine variety of Odontoglomm coronariam. It is much to your credit that yoo have been successful in growing it for solong a time, and flowering it. - M. 1, Lastrea rigida; 2 Lastrea recurva; 3, Nephrodium molle; 4, Nephrodium molle corymbiferum; 5, Pteris longifolic; 6 , Blechnum poly podioides. - $H_{0} F_{1}$, Leeds, $1, C_{r}$ tasetum Gnomus; 2, Brassia caudata; 3, Rodriguezia pubercens.-Lymington. Amaryllis reticulata, an almost evergreen stove speciea. - J. M., Peebles. Cattleya Harrisoniana,-C. T. 1, Polj. gonum Persicaria; 2, Ethuna cynapium ; 3, Polygonum aviculare; 4, Polygonam Convolvalun. The shells were utterly crushed.-W. P. Rhamnu Frangula.- X. Y. 1, Phyllanthas nivonas (Eaphorbiaceæ) ; 2, Myrsiphyllom asparagoides (Lilisece). We have no idea why it should be called Smiles, beyond the fact that there is a remote rene. blance.-Munches, 1, Cornus mas variegata : 2 Echium valgare; 3, Phacelia tanacetifolia.
Paciing Graprs for Tranitt: G. H. C. For beht manner of packing Grapes, either for market or private consumption, we woald refer you to Garo deners' Chronicle for 'S $\rightarrow$ pt. 27, 1890, p. 363, where various methods are fally described, and a for illustrated.
Phyllanthus nivosos: $X, Y$. Stove treatment it all times. Soil for potting, andy loam of a fthrou nature, and similar peat, nodules of andatone or porous red brick, dried cowdang or other mill manure, and well drained pota. Daring the summer aeason it does well in a house which is kept rather moister than dry, doing well mith Aroids. anch an Philodendrons, and the like. To get the white mottling of the leaves an good as possible it should not be densely shaded of overpotted, and it should not be placed far froin the glase. In the winter it uaually loses tome or its leaves. Prane it if you like before actiro growth begin.
Tomato: W. $R$. One of the diseases cauned by fungi, repeatedly figured and dencribed in these columith You can do nothing now, but next season apply Bordeaux apray early to the foliage and renf young frait. Be carefal not to ane it too merong ; refer to recent back numbers for further detailUbique. The appearances are connistent mith nome check to growth at a certain tange of development. There is no insect or fankur visible. The conditions too common, bat the cause is not clear.
Woras in this Garden: $O . H$.W. Use clear liseWater ; keep duckg, or, better atill, banoluil chictene.
Worms on Lawns: W. A. R. The anuwer apparel on Augut 10, nee p. 167.

 J. F. B.-W. W. Kelly. - W. G. J. H. C. S. (next week).

SATURDAY, SEPTEMBER 7, 1895.

THE NATIONAL HORTICUL. TURAL SCHOOL AT VERSAILLES.
IN the year 1874 a National School of Hortioulture was established at Versailles, on the site of the old kitchen-garden. The oreator of this kitchen-garden was the famons John de la Quintinie, about whom it may be interesting to give a few details. Born at Poictiers in 1626, Quintinie early showed that he had a strong inclination for the stady of agrioulture and hortioulture. He began his gardening oareer as manager of the gardens belonging to Tambonenu, the then President of the Chamber of Acoounts. He is said to have applied himself to so intense a study of the operations of nature that he soon became famous all over France. He made many curious and useful experiments. He was the first who proved it useless to join fibres to the roots of trees when transplanted, and he disoovered a sure and infallible method of proning trees, "so as to make them not only bear fruit, but bear it in whatever part the owner chooses, and even produce it equally throughout all the branches, whioh had never before been tried, nor even believed to be possible" (vide Chalmars' Biographioal Diotionary, vol. Xxv.).
Quintinie came to England in 1673, and during his stay here paid a visit, at Wotton, to Mr. Evelyn, who prevailed on him to commanioate some directions concerning Melons, for the cultivation of whioh Qaintinie was remarkably famous. These directions may be oonsulted by those who are interested in the history of gardeniag in the Philosophical Transactions of the Royal Sooiety for 1693. It is said that either Charles II. or James II. made Quintinie an offer of a considerable pension if he would stay and take upon him the direction of the Royal Gardens, but he preferred to serve his own King, Lonis XIV., who made him "Director-General of all His Majesty's fruit and kitchen gardens."

The architeot Mansart it was who designed the kitchen-garden, the "Potager," as it is termed in French, but anfortunately, although he ohose a spot that was in harmony with the general appearance of the gardens and park, he made the mistake of not thinking about the effect the site and the nature of the soil would have on the vegetables and fruits. He had oonstruoted the orangery at the south of the palaoe, and in front of this astonishing edifice a Swiss regiment had dug the lake which atill bears the name of the "Pièce d'enu des Suisses." Muoh of the soil of the kitchen-garden was formed from the earth thrown up by these works, and it was not as good as La Qaintinie would have liked to have seen. Moreover, the kitohen-garden was in plaoe where had been formerly a deep pond, and it was necessary to fill up the place of this pond.
In Qaintinie's book entitled Inetruction pour les jardins fruitiers et potagers, one can read of the difficulties he had to contend with in bringing
the Versailles kitohen-garden to that state perfeotion for which it was renowned. The gariden was begun in 1878, and was not completed till 1683.
The enolosure placed under Quintinie's direation contained twenty-nine gardens, separated by walls ranning in different directions, thus giving opportanities for different treatment of the various plots. One is struck while going over the gardens by the happy idea of the organiser, which was to surround the large squares in the middle by terraoes, so as to protect the plants against the wind, to refleot the heat of the sun, and to afford large surfaoes for fruit-walls.
Quintinie was a great anthority on all kinds of froit-trees, but the Pear was evidently his favourite. In the east of the Potager may be seen two magnifioent Pear trees planted by Quintinie himself in 1885 -one of these trees, more than 200 years old, is nearly 30 feet high.

Lonis XIV. was very proud of his "Potager de Versailles." He liked to take walks in it, and would interest himself in the caltures. He was a very hesvy feeder, and, as the chroniole tells us, he liked to have Asparsgus in December, Radishes and Lettuces in Janarry, Canliflowers in Maroh, Strawberries in April, fresh Peass in May, and Melons in June, Quintinie exerted himself to satisfy his royal master, but it will easily be imagined that it was not always easy to do so. When the great gardener died in 1688, the king is reported to have said that he had experienced a great loss which he never expected to have repaired. A statue of Quintinie now stands in the gardens which he oreated.
The Ecole Nationale d'Horticulture oconpies the buildings, gardens, and other places where were once the kitchea gardens of the kings of France. The establishment is split up into different seetions, the whole ocoupying a space of some 24 aores. Part of this space is
taken up with kitohen taken up with kitohen gardens; besides these there are the plots for frait trees, experimental culture beds, greenhouses, an orangery, a winter garden, a sohool for the botanioal stadents, \&o. There is also a little model nursery.
The objeot of the sohool is to train gardeners, and to instract them in the theory and practios of horticultare; to provide teachers of hortioulture for the pratioal and normal sohools of agricalture, to trsin professors of horticalture and landoape gardeners, to turn out well-ednoated agents for public or private offioes-in a word to provide for all those who may need it an effioient education in all branches of horticulture.
The students who have satisfied the Minister of Agrioalture as to the conditions of admission, and who have passed the preliminary examinations, reocive a three yeary' training at the school. The theoretical teashing inclndes
the following courees: - the the following courses:- the laying out of gardens and the construotion of greenhouses,
instruction in phytios, meteorology, chemiatry instruetion in physios, meteorology, chemistry, geology, mineralogy, the collture of estrily
vegetables, horticultural zoology and entomovegetables, horticultural zoology and entomology, ornamental arboricaltare and the repro-
duction of vegetables, pomology, floricaltare, duction of vegetables, pomology, floricaltare,
botanical work, the care of frait trees and method for getting early fruit. Besides these special studies, the pupils are instructed in English, mathematios, topography, drawing, \&c. The pupils are not simply gentlemen-gardeners, engaged in book-work and in looking at resalts and practical worls, but they are expeoted to work with their own hands, and thus soquirs
considerable dexterity of manipalation. considerable dexterity of manipulation.
The School of Hortionltore
The School of Horticaltare is provided with
excellent materials for instruction, induding excellent materials for instruction, provided with wing
library, a laboratory for horticolltaral rosearoh,
a meteorologioal station and fine collections, which inolude plant-albums, herbaria, speoimens of seeds and woods, a little museum of useful and noxions animals, models of implements, oasts of fruits, \&c.
The oreation of this school was due to the initiative of the late P. Joigneana, an eminen agricalturist and a depaty, and its organisation to the late Auguste Hardy, who was one of the first hortioultarists in France. To-day it is under the direction of M. Nanot.
For many facts in the above sketch we are indebted to an article that revently appeared in $L_{a}$ Nature over the signature of E. Hennebert. H. C.F.

## New or Noteworthy Plants.

## CATASETUM FEROX, Kranzlin, n, sp.*

If not beautifal, this is certainly a very atriking plant, in habit rather like the other Cataseta we have in our stoves. The spike beara sbout twenty fowers of dirty-green colour outride, and pea-green inside, more or less apotted with amall parplish spots. The sepals and petala are of about the seme size and form, growing in a sort of helmet as in some other Catsasta, Cataaetum puram, Nees, for instance (= Cataraetum inapertam, Hook.). The mont pecaliar part of these flowers, and the one by which they can easily be diatinguibhed from other species, is the lip. This part is rather omall for a Catasetum, and looke very like a lower-jaw with a prominent chin and teeth; on both sides there are two rows of molar teeth, not very long and prominent, but broad and atont; a little behind the top is a row of six; very prominent incisor,s, the middle ones coherent except at the apex. The plant wac introduced by Meurra. F. Sander \& Coon, St, Albana, and flowered in midoummer. F. Kränzlin.

## Lagospadix Michouttun, Ridley, n, sp. $\uparrow$

I have received, through the kindness of Mr . Micholitz, apecimena of a very remarkable new Palm, a species of the small genas, Lino opadix, from the mountains of New Grinea., Seeds of the plant have been enent to Mr. Sader's establishment at St. Albane. The genas Linorpadix is typically Papuan, though the original and best-known apecies, L. monortachys, Wendl., in a native of Northern Anstralis. The present apecies is unique in ita genus in being quite atemless, the wedge-shaped leavear rioing erect from the ground in a large taff ; they are upwards of 4 feet in height, narrowed into a petiole at "the bave, and broadening upwards, and end in a pair of long acate points. The apadices are extremely ylender and elegant, and are remarkable

[^16]in being unisexual, the male and female flomers being on different spadices. The frait is oblong, about half an inch long, bright red, the albumen of the seed white, and very hard. The plant inhabits the wet ravines of the higher slopes of the mountains.

## THE FRUIT CROPS.

[For Tabulated Summary, see p. 119.] (Concluded from $p .208$. ) 5, SOUTHERN COUNTIES.
Berksifre - Notwithstanding the drought, which prevailed more or leas up to July 18, I am able to report in this district one of the best all-round crop ever seen; and having bad copious raine (oince abora date to Jaly 31,460 inches), I have every confidence that a good crop is now assared, although maller in size than asual, through drought. Applea are a very heavy crop; names need not be given, u nearly all here are carrying heavy crops, in a collection which includen over 200 varieties. Pearn a fair crop, rather under average, but will, I anticipate, be of fine quality, as the frait is clean, free from rust and now awelling rapidly. Cherries were an extra. ordinarily heavy crop, and fruit large ; trees making good growth, and free from black-fly, which is asually very troablesome here on walls. Peaches and Nectarines, good crops, and tree looking well. I bave been gathering good-sized Peaches, of fine colour, from south walls, since Jaly 16, variety Alexander. Apricots, average crop, of nice clean fruit. Plame, mediam crop, of good quality. Dammons, heavy crops. Strawberries were a good crop, but only by peraevering with thorough watering for several weeks ; frait firm, and of good size ; Jamer Veitch proved a good variety here this reason, and of better flavoar than asual. The appearance of the beds, after severe frost in spring was deplorable -nota leaf left, and I had doubta whether many of the crowns were not killed outright; however, when growth commenced, they soon recovered, and showed atrong bloom. Unfortunately, May was very dry and hot when fruits were set and swelling and this checked the crop considerably. Only 36 inch of rain fell here daring May. Small fraite are abuadant. Gooseberries formed a remarkably heavy crop. Raspberries were plentifal, bat the fruita rather amall. Nats: Filberte average crop; Walnuts the heaviest crop I ever saw, and the branches are already bonding with the weight. Owen Thomar, Royal Gardens, Windsor.

Dorsetshirb,-The Apple trees and baches givo promise of a very fine crop, and the beat of them are Annie Elizabeth, Beauty of Kent, Bismarck, Bromnlees' Rasset, Davonshire Qaar renden, Datch Mige nonne, Irish Peach (very fine), Kerry Pippin, Kerwick Codlin, Lord Saffiold, Margil, Northern Spy, Reinette du Canada, Ribaton Pippin, and Warner's King. The best Peara are Bearré Rance, Bearté Diel, Glou Morceara, Marie Louise, Willisms' Bon Chrtien, Thompon's Seckle, and Catillac. Raspberry Saper lativeshould bs more known, ae it ie a very fine variety, and a heavy cropper. Strawberry Royal Sovereign, fruits of which were ripe here on May 29 on a south border, in point of earliness is equal to Noble, and much superior in quality. Thos. Denmy, Down Howe Garden, Blandford
Hampahiar -Applea are an average crop on the whole, some varietien, as for instance, Lord Saffield, Lord Grosvenor, Warner's King, Blenheim Orange, Cox's Orange Pippin, and Stirling Castle; Mère de Méage, Irish Peach, King of the Pippins, and Devonahire Quarrenden, are bearing heavily; otherf, such as Ecklinville, Lady Sudeley, Bismarck, Lady Henniker, and Golden Pippin have a very thin crop. The trees are very healthy, and free from ino sect pente of any description. Cherries were ro markably good, May Dake, Governor Wood, Eliton, and Bigarreas Napoleon were the most astisfactory varieties. Strawberries have borne immense crops of fine frait, Royal Sovereign and Sir Joseph Puaton eapecially. Raspberries suffored from the frow E. Molymenz, Swammore Park, Bishop's Wallhem

Apples are large and early, but many of the fruit dropped, I think for the want of rain; good crops on Kenwick Codlin, Lord Suffield, Blenheim Pippin, Hawthornden, Cellini, and Iriah Peach. Pears, good on tue walls, but the fruitn have dropped badly trom the cold nighte and want of rain. Plums good on walls, and very early. Peaches, a fair crop, the trees clean, and look well. Damsons, plendid crop. Strawberries were a bad crop. Rapberries, on the contrary, were a good crop, but auffered from drought. Wm. Smythe, Basing Park Gardens, Alton.

Keat.-Apples and Nate are the crope of the season, and the rains we have had will assist them greatly in swelling out. Pears are rather thin in this district. W. Craik, Hothfield Place, Ashford.

- Apples, especially early kinds, are very plentiful, later kinds more scarce; the fruit promise well, although many have fallen through drought. Blenheims are very good indeed; Lord Derby, Warner's King, and many others well laden. Pears short, but promise to be of good size and quality. Plums scarce. The dry weather han been all in favour of Cherrios, and fine fruitm bave been marketed. Peaches and Nectarine: plentiful, bat will be rather amaller than uaual through drought. There have been heavy crops of Strawberries, bat the season short; late kind did not grow so large, though good-flavoured. Carrantegood. H. Markham, Mereworth.
- Applea form a aplendid crop around here, almost all the well-known varieties are cropping remarkably well. It in really murprising how well the fruite have developed daring the drought. Blenheim Orange on large trees are carrying very heavy crops. Worcester Pearmain, Irish Peach, and Quarrenden are found to be smonget the very best for marketing, being sold at the foot of the ladder, and generally realise good pricea. Cox's Orange Pip. pin is cropping heavily, and neceanitates a great deal of thinning to encourage fair size and quality. The old Ribaton Pippin is bearing well. In reference to this Apple, I find it neceasary to thin to a single frait, on account of the stalk being so short that they puch one another off before they have finished growing. Amongat some of the newer varieties I am fraiting this year, and which strike me as being good croppern are-Swedish Reinette, with a beautiful bloom; Barnsck B?anty, colours well, sn immense cropper; and Bramley's Seedling. This latter is fraiting well on the Paradise. Where it can be done, the fruit thould be thinned, as poor samplen this year are not likely to be of much use for marketing purposen. Damsone are a very good crop, but Plume varying. Peaches and Nectarine are a grand crop. I am calculating to grow about 12,000 this year. I gathered my firnt fruits on Jaly 22 from a west wall-the variety was Alexander. G. Woodward, Barham Court Gardens, Maidstone.

Middeesex. - Applee are most abandant, almost every tree bearing a full crop. Frait rather amall, but the late heavy rain will benefit them mach. Plum on walls were quite a sight. Early Favoarite is a variety that was ripe on Jaly 20 , and in apecially to be recommended as a firat-clase fruit for densert. A.F.B., Chiswick.

- Frait crope on the whole are a fair crop in this neighbourhood, but the dry weather told heavily upon the bash-fraita and Strawberrier, and where water was not anpplied the cropt of the are light and amall. Piucu in many places are a failure Victoria eems to be the principal sort bearing well this season; the tree are very free from blight, so are the Cherriea. Cherries and Peaches have ripened very early this neason. Good Waterloo Peaches were gathered out-of-doore on July 14. W. Watson, Harefield Place, Uxbridge.
with the prolonged frost cansed a late bloom, with the result that mont fruits are plentiful. Apples and Pearm at one time promised a very heavy clop, but the great heat and the drought have caased many fruits to drop. Apricote are thin, but good. I never naw Peacher and Nec.
tarines more healthy, or bearing better crops, but ach trees have, daring the drought, required mach attention. Cherrie were all one could denire. Piums a mall crop, but the trees look well. Strawberries were very good, and very early; Royal Sovereign and British Laeen are varietiea that have given aplendid cropa. Currant and Gooseberriea good and plentifal; but mont mall frait in thi district suffered much from drought. $G$. Wythes, Sion House Gardens.

Surrex. - With the exception of Peara, all the fruit crop here are mont atisfactory. Apples (empecially on foung trees) have required severe thinning. Damsons are heavily laden. Strawberrie were of large aize and good fiavour. We commenced picking Noble on Jane 14, and finished with Latest of All on Jaly 16. Caterpillara have been more than asually troablesome on the Gooseberry bushes ; and owing to the continued drought, red-apider has made its appearance on many of the fruit trees. G. W. Cummins, The Grange, Wallington.

- Apples are looking well, and promise to be a heavy crop, enpecially Grenadier, Stone's, Peasgood's Nonsucb, Lord Suffield, Lord Grosvenor, Wellington, Allen's Everlating, Prince Albert, Lord Derby, and Oldenburgh, kitchen; Cox's Orange Pippio, Brownlee's Russet, Blenheim Orange, Kerry Pippin, and Mother, dessert. Red Currants and Goomeberries were very fine in quality. Rapberries wiffored mach from frost, but the fruit wat very large. C. J. Salter, Woodhatch Lodge Gardens, Reigate.

On some trees there are very heary crops of Apples, on both old and young trees; others have few and some none, in the mame locality. Pears not no good. Plums very thin. Young orchards in high cultivation, making aplendid growth. I never asw Peaches on walls looking better, both in fruit and foliage; small fruit of all sorts plentifal and good, with the exception of Raspberrien, which are very mall. W. Miller, Ruxley Lodge, Esher.
Sossex.-Plams in this district affored much through the severity of the frost daring last winter, particuarly those in exposed places, the consequence beiag a bhort crop. Many of the Dimson trees were almost killed by the frost, Frogmore Prolific nufferiag the most. Apple are an abandant crop, but the frait is mall for the time of year. Pears on trees in the open are a very partial crop, and Cherriea were never more abuadant, or of finer quality. Peaches are small, owing to the dry weather; and the same may be said of Apricots and Nectarines. Strawberries have been very abundent. Black Carrants were the heaviest crop we have ever grown. H. C. Prinsep, Burted Park.

Wilis.-Apricots, Peachen, and Nectarines, on which the blooms wert protected from froste, set immense crops of fruit, thereby necensitating evere thinning of the latter. Apple trees in orcbards are heavily laden with frait of good quality, at also are espaliers in kitchen gardens, inclading treen of Aunio Elizabeth, Red Astrachan, Baaty of Buth, Junesting, Irish Peach, Stirling Castle, Keswick Codlin (a never-failing cropper), Emparor Alexander, Dachest of Oldenburg, Ecklinville Seedling, \&c. ; the treen, too, are in good condition. Plums and Peart geriorally are under sverage. Gooseberries, heavy crop. Carrants and Raspberrie average. Wainats are a heavy crop, and the asme may be said of Filberta and Cob nuts. Altogether, the frait crops of 1895 miny be atated at being highly asiafactory. H. W. Ward, Lonqford Castle, Salishury.

## 7, ENGLAND, N.W.

Lancasmirr.-Fruit treen are clean and hoalthy. Apples and Pears are a good crop, slithough many of the fruit droppsd in consequence of the drought. Damsons are very plentiful, and other kind of Plums are as good as I have seen them. Gooneberrien and Rapberries had heavy crops, and the fruit of the latter old at 5o. per dosen quarts. Strawberrien abundant, and secured withont much loes from wet. "Growers for maflet in this part confine themselves to Barnes' Prolifc, premumably a
local variety. W. ${ }_{2}$ P. Roberts, Cuendon Hall Gardens, Preston.

- Apples small through drought. Pears plentiful on walls and trained treen. Damsonsare a very heavy crop, a circamatance that occurs about once in even yeart. B. Barham, Croxteth, Liverpool.

Westmoreland - Apple and Pear trees are very clean, and the good bearing varietie have excellent crop contidering the sunless anmmer we experienced last year, and the unasaal amount of east wind and frots this meason. W. A. Miller, Underley Gardoss, Kirkby Lonedale.

## 8, ENGLAND, 8.W.

Cornwall. - Fruit crops are very good on the whole, the only deficiency being in Raspberrie and Gooseberrien: Peachew, Nectarines, Cherries, and Currants eapecially being good. Strawberries were an immense crop, and very fine, Sir Joseph Paxton and Laxton' Latest of All being the beat. Alfred Read, The Gardens, Port Eliot, St. Germans R S.O.
-The Apple crop in Eant Cornwall is under average, but many varietien are carrying a good crop, and the fraits are large and clean; Blenheims, Cox's Orange and King of Pippins being the best. Pears are good, and, at present, show no signs of cracking. Strawberries have been aplendid; in spite of the heavy crop, the late fruita awelled up well, Latest of All on a north border giving us nome grand fruits. Cherries also have been very fine, the dry meason uniting them on our heavy moil. Buah fruite abundant and good. Charles Page, Bocomnoc Gardens, Lostwithiel.

Applo-tree gave promise of abundant crops early in the season, bat fully $t$ wo thirds have fallen, many of the trees being left without a single fruit, the result, I think, of the severe and prolonged eaterly gales. Cox's Orange, Sturmer, King of Pippins, Mère de Méaage, and Stirling Castle, appear to have stood best. Pearl are numerou enough, but promiss to be very mall. This is not a good Cherry district, but they have been exceptionally good with me this year. Peachesand Nectarines are a grand crop. Plums are a complete failare. Medlars and Qainces are very good. Buth-fraite are all good, and grown under permanent wire-net, which is much less trouble than old fish-net, and less expensive in the long ran. When I first adopted it ten years ago, I was told that caterpillars would never allow me to have a frait, but a little helibors powder soon deatroys them, and they have given less troable than under the old plan, though the birds are not allowed inside the wire, winter or summer. Wm. Sangwin, Trelissick Gardens, Truro.

Davonsmire.-The frait cropt are all alike good, and up to or beyond a fall average. All stone fraite, especially Victona Plums and Damsons, are a full crop. The same of Peaches, Apricote, \&ec., and an almost entire absence of aphia and other insect life, and blotched leaves. The resalt is a very astisfactory promise for another year. Walnuts and Filbert most abundat, sud far in excess of what is ordiasrily seen. James Enstone, 38, Temple Road, Execter.
Gloucestershire.-The frait crop generally in this district is the beat I can call to mind for some jears. The trees are particularly free from all kind of ineecte, and have made good, clean growth. We escaped the frost of Jane 15 which proved so dianetrous in some parte of che country. Thos, Armold, Cirencuator Homen, Ciremocter.
Hemerondshram.-The fruit crops in thie diatriet are genershy very goad, and, considering the very dry weather during early enmmer, is of good quality. The blowom was very abundat, bat the grab has been vory bad in wome parts. Frank Harris, Eastnor Gardens.

- Fruit crope generally are good, and the fruit clean, excepting Apricots, which are very much apotted and unkind. Scrawberries have heen a heavy crop, and the dry weather was favourable for keeping the fruit when ripe. Thos. Spencer, Gondrich Court Gardens, Ross.

Monmouthenire.-Strawberrie were a good crop and of good quality. Bach fruits of all kinds were remarkably good in every way. Plums are a good average crop, Victoria, Early Transoarent Gage, Kirke's, Jefferson's, and Coe's Golden Drop are heavy bearers. Pears are partial, the beat cropa being upon weat and mouth walls, those on east walls, excepting Marie Lonise, are thin; the cropa on pyramid trees are also partial. Cherrier are good, particalarly May Dake and Morellos. Apples generally have suffered from caterpillara where no meana have been adopted against them. Amongst the bent croppera are the following:-The Queen, Gatcoigne's Seedling, Grenadier, Lane's Prince Albert, Sandringhsm, Schoolmaster, Tyler's Kernel, Warner's King. Cellini, Brownlee's Ra*et, Coz's Orange Pippin, Kiog of the Pindins, and Worcanter Pearmain. Thomus Coomber, The Hendre Gardens, Monnouth.

- I do not remember observing anch an absence of blight among the fruit crops generally. Apples and Pears are good in various localitien, whilat in othere there are acarcely any, but on the whole an average crop will be secured. Small fruite are very plentiful and clean. John Loekyor, Pontypool Park Gardens.
Sombasetahire.-I never have seen a better crop of fruit all round than this year. The apring was most favourable, not having any late apring frost, and we had glorious summer weather, which has had a good effect on all kinde of fruit. I never remarked Apples getting high colour as early at they did this sesson. Apricots are grand. James Crook, Forde Abbey, Chard.

Worcmersasmins. - A very aatiafactory bardy fruit season, taken collectively, the trees being both clean and heslthy, aphis and winter-moth larvo having given very little troable. Applen of all kinde are heary, clean crope, slready highly-coloured. Apricota bloomed aparaely, but the quality is very good. Raspberry canes were injured by the neverity of the frost in January. Pears are \& very thin crop, although the treas gave an abundance of strong, perfect flowers. The fruit apparently et well, but the blossome mat have been unobaervedly attacked about the flowering period by the insidions Pearmidge, Diplonie pyrivors, at the young fruit dropped off in shoals when about the size of a cob-nat, and when opened they were found to contain acores of the midge larvse. How to prevent future attacks is a problem jet ansolved, and is a queation of the very greatent importance to fruit growern an well an to ourselves. William Crump, Madresfield Court, Malvern.
-The Apple cropin a good one, and the trees are healthy, and clearer of caterpillark than has been the case for neveral years past. The Pear crop in orchard and in the open, as might be expected, is light, after the enormoas one of lant year: but on the walle there are large crope of fine fruit. Plume and Damsons, as a rale, are average crops. Cherries have been most abandant and good. Apricote are very partial, and in my own case a complete failure. This I attribate to the wet, aunlewa atumn, and to the mubsequent severe frost, and alse to the fact of their being in a comewhat low and damp aitaation. 1 began gathering goodcoloured examples of Early Alexander Peach on Jaly 13. Strawberriea, Currante, and all buah fruits, with the exception perhap of Raspberries were abandant. Walnuts, and the common Hazalnute are plentifal. Fruit trees of all kinda are this year remarkably free from aphis or any other incect peate. John Austen, Witley Court Gatdens, Stowrport.

## WALES.

Cawboaserurs - 8 mall fraite have been very good; in fact, we have never had better crope. Applee are a very heavy erop, the branchen have to be applet are on many trees. Pears are sbout average crop, and very promixing. Strawberries were very good, although the sewon was a shoriot one. B. C. Whatiam, Cróswood Paik, Aboryfituith.

Denbighshiab,-Applen had an excellent appearance until the terrific thunderstorm of July 26, when they were teverely peppered with ice-hail, much of it measuring 1 inch in diameter, after which half the crop fell, but plenty atill remain, though much marked by the bruising of the storm. Weregiatered 306 in 45 minate ; nothing like it has occurred here within memory. Bash fruits of all sorts were excellent, and their ceason was prolonged by the late rains. Cherries were good crops, sud of good flavour. Apricote are extremely thin. Strawberrien were vary aboudant; Noble bas done splendidly, being early and large; Sir Joseph, very fine; Dr. Morère, a French Strawberry, of excellent merit for packing, large, flavour good; John Raskin was very good-in fact, all sortu, excepting President, which we ahall now discard. Victoria clase of Plums are heavy cropy, but Gage are thin; Damsons excellent. Birds have been less troublesome than for yearn. The long frost hat done good service in clearing away much of the American blight. Frost cleared off all weak fruit trees and busher. P. Middleton, Wynnstay Gardens, Ruabon.

Glamorganshire. - Apple and Peare are an abandant crop in this district. In the gardens here the trees have had to bs propped up to keep the branches from being broken by the great weight of fruit. Plame are an average crop, and the treea are freer from aphis than unal, notwithetanding the long-continued drought we experienced during early summer in this locality. Strawberries were very good considering the dryness of the meason. A. Pettigrew. Caitle Gardens, Cardiff.

- Apples are an exceptionally heavy crop, and very clean. Pears, average, but auch varieties as Winter Nelis, Glou Morcean, Louit Bonne, Chaumontel, Thompan'a, and Doyenné da Comice, are carrying heavy crops. Strawberrie have been mout prolific, and very fine, and the flavour all that could be wished. Plamt are quite an average crop, and very clean. Cherries I never remember being so plentiful. All small-fruits have been very plentifal, with the exception of Gooseberrien, these have been quite a failure in mome gardens, $R$. Miner, Penrice Castle, Swansea.

Montcomeryselas.-Very heavy crop of Pluma Gooseberries, and Applen. All fraite are clean and healthy and abundant, with the exception of Apricota. John Lambert, Powis Castle.
Pembrokeshite.-Applen are a very heavy crop the weather being fine and dry when the treen were in bloom. Pears are a very light crop, the treet having been fruiting freely this past two nessons, they appear to be exhausted to some extent. Plums, eapecially Victoria, Jeffermon's, Prince Eaglebert, and Damsone are a good crop. Small fruita were all good, with, atrange to say, the exception of Gooseberries, which were rather a light crop. Rsapberrien were very good, where the canes were not injured by the winter'a froat. Geo. Griffin, slebeck Park, Haverfordwast.

## IRELAND

Co. Demenv,-Apples and Peare are a light crop, but of good quality. Peachen and Nectarines are a good crop. Apricote better than they have been for some years. Cherrien very good. Small-frait of all sorts heavy and good, except Black Carrante, which were s amall crop, and poor in quality. G. $\mathrm{Sm}_{\mathrm{mith}}$, Vice-Regal Garden, Dublin.

Galwar.-Notwithatading the exceedingly dry month of April, May, and June, we never had a more plenteous crop of all kinds of frait, the quality has also been all that could be devired, and with a moderately fine autumn, Apple and Peare are aure to finiah off well. John Cobban, Garbally, Ballinasloe

Kraey.-Applew promiae an abandant crop. Reare are rather thin; there was plenty of bloom, but a cold eat wind blew mont of the time they were in flower. Plama are good. Gooseberry, Carrant, and Ravpberry crop wore excellent, and wo have hid an abun-
dant crop of Strawberrien. Geo.M.Breeze, Koimas Gardens, Killarnyy.

Kildare.-The fruit cropy, excepting amall fruith are mach below average. The blossom was abundaus, and appeared strong, and apparently the light cropin the effect of imperfectly-ripened wood. I am incliaed to think that the Apple trees have not recovered from the effects of the heavy crops they carried two yeur ago. The fruit of Apples and Peara are small, and require more heat. J. Wyke, Bishop's Court, Strafat -- With the exception of Apricots, all fruita an plentiful and of extra good quality, and, owing to our atrong-holding soil, we had no necesaity to wam, which, at a rule, does more harm than good. Pean are a very heavy crop. Rasperrie are the finen crop I have ever seen. Strawberries also were exth good, and lasted over a long period in apite of tho dry season. Fruit trees of all kinds are very hallthy and clean. Frederick Bedford, Straffan Hows,

King's County.-The fruit crops collectively are good in thit district. Owing to the severe winter the trees were a month later than usual in expanding their blossoms, consequently they eacaped the apring frosta which often deatroy our frait cropa, and good set way the result. Pears are the only excep. tion here, they being but a very indifferent crop, and small and late. T. L. Hart, Birr Castle Gardam, Parsonstown.

Longeord.-The fruit crop has been on the whole very good; not for many years have I seen tho Stramberries so good in quantity, aize, and favour. Small fruits also very fine. J. Rafferty, Castle Forbu, - Longford.

Co. Watarford.-Apple are very good thia yar, both early and late varietien. Annie Elizabeth is loaded with fruit; this variety never faile hers, Hollandbury alwo beara well, and is a noble-lookiog iruit. Strawberries inever did so well with mem this year. Thos. Singleton, Curraghmore, Portan, Ireland.

Wicklow.-I have vieited a good many of the leading gardens in this connty, and in slmost evers place I saw a capital crop of bush-frait, Applen, Pears, and Strawberries; but Apricots are ruy acarce. Levi Childs, Kilruddery Gardens, Bray.

## CHANNEL ISLANDS.

Jerser.-Plums, which promised well, heve been affected by the drought, and are a light crop. Tho yield of Strawberries was poor on light noila, bat abundant on the heavy land. Many Fig trees wert destroyed by last winter's frost, bat those that nulo vivid have generally an abandant crop. Correspondent

Gusessex.-Apples have no doubt benefitad by the abnormally light crops the trees carried lu year. Peara also are good. Stone fraits, bowerep are far from a success, probably from wat of rel matarity in latt season's wood-growth. Strs. berries were a great auccent, and stood betiwn than could have been expected with ach of weather. The younger beds, however, did mach tho best, and scarcely felt the droughto Rupberty canes wre much damaged by the eovere and exta ordinary long frost we had laat Febramy. Chat. Smithson, Caledonia Nursory, Guernsey.

Isle or Max. - With a few exceptions, the Apple and Pear crops in this diatrict are very poor, Goole berries, Raspberries, and Carrants were very plentiful and of fiae quality. Strawberrien very gova, ano over, owing to the long apell of diy Wow James Murphy. Cronkbonrne Gardens, Isle of Mow

The Carob bean (Cematonia giliqua)This is exported in very large quantitie tram Napley, boing aent ia balk to Rassis add Germititit bat the pods are packed in birrela fot tha Aarly, and market. They are uned a good deal is faif, trell are anid to be an excellens horse-food. Tod rupt are deacribed as being of two kiady, called ruph" tively the "Honey Carob" and the "E
the former being the sdarcer of the two.

## [EUPATORIUM SERRULATUM.*

We are indebted to Mr. W. E. Gumbleton for the apecimen from which our illustration (fig. 50) was taken. The plant is a native of Uruguay and Rio Grande do Sal, Brazil. It was described long ago by De Candolle, and afterward by Baker in the Flora Brasiliensis. It was introdaced into cultivation by M. Ed. André from Uraguay. It in a abrubby plant, 5 to 6 feet high, and the flowers are a rosy-lilac. Oar illustration and

## Orchid Notes and Gleanings.

NATURAL HYBRID MILTUNIAS.
Flowers of two very singular, diatiact, and pretty Miltonias come from Mr. John Cowan, Managing Director of the Vineyard and Narmerien, Garston, Liverpool, accompanied by the following note: "Herewith are two flower labelled A. and B. of plants received from our collector in Brazil as nataral bybrids of Miltonia candida grandifora and
folding over the colamn; white with a purple diec, and with traces of the fine alight ridges seen in M. candida at the base of the lip, bat with the bi-lamellate creat of M. caneata atill more pronounced. The colamn is booded and tinged with lilac. The flower are much firmer in texture than those of M. candida, and trace of the two repated parent are evident.
Variety B. is essentially the asme in the main points, but the sepals and petals have the chestnutbrown barred with the pellow markings of M. candida, and more distinct traces of that specien appear in the

the deacription and figure in the work cited below preclude the neceasity for giving fuller detaile now. Io this country it mat probably be grown as a greenhoure plant, I at we are informed by Mr. Gumbieton that after keeping it under glame throughout the winter he piaced the plant in the open ground, where it has foimed a good-nized buth, too large to be conveniently moved. It will be intereating to acertain if it will urvive the winter ander auch condition.

[^17]M. cnneata. The plants in appearance certainly bear out the anggeation. We shall be glad of your opinion of the flowers."
The flowert weem to point concluaively to the correctness of the collector's auggention. The variety marked $\mathbf{A}$. has the erpals and petale an in M. cuneata, but alighly brosder, and exhibiting in a marked degres the peculiarity of that apecien, in the flatly diaplayed sepale and petale being abruptly turned backward and upward at the tipa. Colour wholly light chestaut-brown with a alight purple shade, and with yellow tipa and narrow yellow margin. Lip irregularly ovate, fat, with up-turned iiden, bat not
irregular margin of the lip, which in rather more taraed over the colums at the bare than is the variety $A$. Both are very pretty and highly intereating varietien. J. O'B.

## Cfparpmica Kimbalitanum.

The September number of the Orchid Review (p.271) contains the following farther note respecting Cypripediam Kimballianam, written in reply to Mr. O'Brien's remarke at p. 154 of onr intue of Augat 10, which neem to clear the matter up:
"At p. 238 of our last innue some remark were made rempecting Cypripediam $\mathrm{K} \cdot$ mballianum, and
the circumatances under which C. prestann has received four additional names were pointed out. We have oince diacovered that there are two Cypripediums bearing the name of C. Kimballianum, and that both are included in the above-mentioned note. We therefore hasten to asy that the reference to the Gardeners' Chronicle figure - the sapposed hybrid between C. Rothechildianam and C. Dayanum, which may be termad C. Kimballianam No, 2-mut be excluded from our note, which will then only apply to the original C. Kimballianam, otherwise C prestan. Of this recond C. Kimballianam we have now seen a leaf and fower, through the kindness of the editor of the Gardencrs' Chronicle, and it certainly doen appear to combine the characters of C Rothachildianum and C. Dayannm, and as both are Bornean, it may be a natural hybrid between them. Mr. J. U'Brien comments on our note to the effect that the writer has 'only (the italics are ours) aucceeded in introducing farther confusion'-in ahort, has 'discovered a mare's nest' (Gard. Chron. for Auguat 10, p. 154). It is true we did not discover that there were two C. Kimballianumu, but we certainly cleared ap the complex history of the original one. And what of the other? A figure was given, with the solitary atatement that it wat anpposed to be a natural hybrid between C. Rothechildianum and C. Dayanum. There is no deacription, and nothing to warn one that it is not the plant hitherto known an C. Kimballianum. As a matter of fact, it is not permimible to call a second plant C. Kimballinnom before the first is diaposed of However, we have now disponed of the firat and cleared the way for the recond, but it mast be written with the sign of hybridity added, thas: C $\times$ Kimballianum. We regret the error, but our readern will now be able to see how we 'jumped to conclasions,' and apportion the blame. It now remains to add a brief description of C . $\times$ Kimballianum: the dorasi sepal is 23 inchen long by 13 broad, whitinh-gellow, with seventeen to nineteen purple-brown lines. Petala nearly flat, 4 inchea long by eight lines broad at base, narrowed to an acute apex above; atrongly ciliate; whitiohyellow, lined with purple-brown towards apex, 24 inchee long, parplish. Staminode obcordate, with a tooth in the sinue, parple-brown, pabescent all over. Leares strongly teaselated. In most re apects the plant approaches C. Rothachildiannm, but the marbling of the leaf, the hairs of the petals, some of which are 2 咅lines long, and the shape of the staminode, all show the infuence of the other apecien. The haira of the staminode mant have come from C. Rothechildianam, bat thowe of the petala can only have come from C. Dayanam. If it is a wild plant, it in a most interesting one, for there can be little doubt as to its parentage.

## The Rosary.

## THE MULCHED ROSE-GARDEN

Ir wam a real pleasare to read a word of proteat from so capable a ronarian as "Wild Rose" in the Gardeners' Chromicle for Augast 24, againat the prevalent but nasty practice of applying malodorous mulchen to Rones. Many who are not exhibitore do it, and thus render the Rove-garden, if not the whole of their garden, anteneble daring the monthe of May mad June-the mont lovely season of the jear in any garden.
Nearly all of this objectionable feature of ehampion Rove culture can be earily got rid of by well manuring the land with pig, cow, or horse-dang in a rotten coadition, and in no other way thould manure ever be applied, unlens the noil be of a close retentive natare, when half-decaged manare may be applied. Thin shoald be dag in after the apring-praning is finished, and not jast roand aboat the plante, but all over the bede, wo that the roots are compelled (an they do readily) to search for it away from the immediate vieiaity of the root-atock The extra degree of moiature which is alway present in the aoil where rieh moiat manure lays, is what lares the roots from home, and thit ezarch for mointare in most active duriog a period of hot dry weather. If the plant sequirs further nutriment daring the month of June or Jaly, when perhap: from excenive wateringe the dug.in manure may have lout some of ite active principies, the ground thoald be drawa together
in ridges or heapy, and nome more manure spread over the roots, but not in contact with them, the ooil being immediately returned over it, and made level and neat-looking with a rake The manare may be ever so offensive when that applied, it is aoon deodorised when brought into contact with the soil, and enpecially if the latter be dry. Moreover, there is no straw and litter to offend the eye, or blew about the garden. The uanal advice given, to lay on a mulch, and sprinkle some earth over it, ontensibly to keep it in place, will not do; observant eyes see through the trick, if the odour does not reveal its presence. The same when applying atrong liquid manure ; it is better to draw drille with the hoe, pour the liquid into these and close them in again. This is a method which the Chineme gardeners adopt, not from any ideas of the cleanliness of the practice, which is far from them, bat because they have found out the atility of shatting up the fertiliser in the earth, instead of letting it lone its virtae, as it would do, by exposare. Voidings of animals of nearly all kinds and hoase-slops can be so buried in little drills, and rendered innociona, as well an useful, as plantfoods. The method is applicable to any kind of gardening in petto: an, for instance, to Dahliav, Hollyhocks, Carnations, Panaies, herbaceous perennials, vegetables of all kind, fruit-treen, Tomatos, and Strawberry-plants. In regard to aalads and Strawberries, it is a method of application that neem eminently desirable, as, by careful une, the manure, whether liquid or solid, need not tanch any part of the plants.

Whatever be done in the way of manaring Rosebed, it will not do for the caltivator to neglect the atirring of the soil with the Datch-hoe. The hoe should always te run through the beds after rain, which cake the sarface, and in a general way, once in a fortnight or three weeks.

## FUNGUS ON FLIES, AND

## PLANT-LICE

A spgcial interest attsches to thone specier of fungi which attack living insects, on account of the experimente which have been made in inoculating some of the most pernicious of garden peats, and prodacing artificially a destructive epidemic. When these experimenta have been anfficiently repeated and confirmed, the resalt will be that the deatinies of the plant-lice will be ia the hande of the horticaltarist, and this would in itself be sufficient to inveat all the details of this phase of paranitic life with abiding interest. The small group of fangi to which theae particular apecies belong bas been called the Eatomophthoracea, and they have an affinity with the fish-mouldp, or Saprolegnim, by reason of a form of conjagation and the production of zygospores. In former times, and for a long while, the only represeatative known in this country was the mould which attacked honse-flies in the aatumn, and fixed them in death to the window-pane. Oa the Continent a few other apecies aoon came to be known, but as the prenent time not fewer than forty or fifty species have been described, of which one has this summer bsen detected at work upon myriads of fies, in the Midiand connties.

The character of these fly-moald has been very fairly made out by a serien of carefully-conducted examinations, which are embodied in a Monograph, published by Professor Tbaxter, in the United States. At firat they attack and absorb the whole internal economy of the insects, and then the conidia appear like a mouldy or powdery mass on the surface of the insecte, varying a little in mode according to the different apecien.
The Eatomophthoraceex are diatinguished by the production of internal byphee of conaiderable diamater, and with fatty contenta, which at length emerge from the host and prodace whitinh maseen, bearing at their extremities large conidial sporen, which are violently discharged into the air, and propagate the disease. In addition to this method of asexual reproduction, there is another which terminates in the development of thick-walled reating
sporen, which may be either aexually produced or zgonpores, or anexaal and azygorporen. Then Enally zow houts. Infection takes place from contac of one of the conidia, which adheren to to surface of a healthy insect, and germimena there, whilst the germinating thread entern than body. Conidia absorbed with the food do sppear to produce infection. After the germinutin thread entera the body of the insect, it growa rapith and produces "hyphal bodies" of variable nizs ut shape, which are constantly reproduced by genem tion, until the body of the host insect is mona lese completely filled with them, and the nutan contents of the body absorbed. Each of them hyphal bodies is capable of developing one or mom threads, which are simple or branched, and prome directly into the outer air, where they become conidia-bearers, producing conidia at their extremi ties. These conidia are formed by conatriction, and are at first contained within a mother cell, which when matare, is ruptured, and the conidinu in ejected to a conaiderable diatance. The conidie themselves vary in form and sizs in the differm apecies, bat are mostly hyaline, and their content contain fatty globulen. The diacharged epore adhem to any object with which it comes into contact, ad if it chances to find a saitable hont, proceeds io germinate at once ; bat if it fails to find a anitabl host, it then forms a secondary conidiam, and mater another effort at dispersion. If the second conidire faila, a third may be formed from the acoond in similar manner to that in which the necond mu prodaced from the firat.
The "hyphal bodien" already referred to a p pro dacing conidia-bearers, may also be concermod in the production of resting-spores, either with or with out conjagation in the body of the host. Anexil reating-spores are either formed by the conveniad of a byphal body directly, or by budding from tho hyphal body. Taey are usually aphericall, with thick cell wall of three layers. Sexaal reating apore of zygoupores,* are produced an a resalt of the coajuge tion of opposite threads, by a method which reminill one of the conjagation of the filamentary fream algx: The matare resting spores are apherical mostly amooth, and acarcely coloured.

The oriziaal and most ancient apecies of thin family is Ecopuss masce on house-fien, to whith was aubsequently added, as an inhabitant of thil country, Empasa culicis on gnatt, \&ce; and thin was followed lately by the identification of Eator mophthora aphidis on various apecies of plim lice. Last of all has now to be added Empan conglomerata on a dipterona fly (Melanotoman acalaris), which have been found attached to the fiower-ppike: of a grasn in myriade pers Birmingenm. The apecies which is of mont in tereat to our readers is that which attacks appides and it is in that connection that these oberratione are made. Df. Thaxter says that his frat acqusisith anca with Eatomophthora aphides was in a groes house daring 1886. In this situation it acted an decided check to the multiplication of the aplidide yet did not apread with anfficient rapidity to rath smoking" annecessary. Ho furtber atates the in one case he observed a large Hop-vine, won 20 feet high, completely covered with aphides, wild were killed off by this fangus in about two wime the affected hoats being fastened to the ander of the leaver, and to the younger shoow a pis by nambera. The destruction of colonies of appis this apecien or by Enpasa Fresenii soems is leand rule rather than the exception, and is at lean very common occarrence."
It becomes a practical question whether thit encouragement, and even the artificial apread of bo fungus amonget colonies of aphides maserraction powerfal agent in the fatare for the dean time is H plant-lice. The difficulty at the present rare appearance of the parasite in this couming consequently the rare ponsibility of them it diseased inaects, in order to place them
healthy colo lee ; but there is the conolation that every extenaion and diatribation of the fangus will help to apread the epidemic, and carry deatruction into the haunts of the plant-lice, as \& retribation for their past hiatory. M. C. C.

## DROSERAS AND THEIR CULTIVATION.

Teas these plants do not receive a more popular thare of the attention of horticaltarits is mach to be regretted; and to aczount for this neglect is difficult, the planta being of easy culture, and taking up bat little apace. Not only is the genas of intereat on account of the insectivorous nature of the foliage but when well grown the plante are pretty and attractive. The members of the genus in caltivation are few, and greenhouse treatment suits them, if frot be excladed. They are moatly natives of the Cape of Good Hope, Auatralia, and New Zaaland while thowe species found in Britain are eatily procared. The plants should occupy a atage where they may be fally exposed to the san, and where the air circulates freely aroand them. Bat although they ancceed in an exponed situation, they mast be kept damp about the roote, and perhape the bet material apon which to atand them is a shallow bed of sphagnom moss, this retaining moisture for a long time. Water should be copioualy afforded, never allowing the compost round about their roots to become dry, and then the secretiona from the glands which give the plants their characteriatic beanty will be copions. If large massea are denired, it will be found advienbie not to disturb them every year, bat simply to top-dress them with peat and aphagnum-mose, which, with the addition of and and broken charcoal, forms the potting material. If single crowns are taken and potted singly, and if of the larger growing apecies, shifted into larger pota daring the aummer, langer leaves will result, but when seen growing together in clumpt they look at their beat; and in the cave of D. binata and D. dichotoma, this is particularly the case. Propagation of the two above mentioned apecies and D. capensis may be efficted by division of roota. If the roots of these are cat into lengths of about an inch, placed apon sand, and covered slightly with sphagnam-mosi, young plants are soon produced. In raising from seed, finely-chopped peat and aphagnam, with a good addition of sand, should be uned. The seeds should not be covered or allowed ever to become dry, and when large enough to handle the seedlinge ahould be pricked-out in pans. As growth towards the antumn ceases, they require a little less water, but sonfficient mast always be afforded to keep the compost moiat, and the roots and bada plump, or ahrivelling will take place, and a weakened growth will result the following year.
The following are amongat those most generally cultivated:-Drosera binata, a native of Australia and New Zewland, leaves seldom more than 1 foot in height, which are once dichotomoanly branched, the namerous tentacles being of a dark red zolour, the glands secreting very copionsly; this is one of the beat in cultivation, and when seen in the sun it is a very attractive plant, and uacally capturen a fair number of insecta. D. dichotoms is anid to be ynonymous with the above, but is always a dintinctlooking plant with iter atronger twice-forked leaver, and lighter-coloured tentaclen. It is the largest apecies in cultivation and makes a good panful, or single apecimen; pinching off the flowers imparts great vigour to the foliage. D. capeasis, as its name implies, is a Cape plant, with a short erect atem, and leaves about 3 inches in length, and a quarter of an inch in width; the tentacles are light red, and longent at the margins. D. Aliformis, a Nurth-American apecies, has long leaves, and flowers of a parple colour; the leaves apring from a amall balb-like bad. Do apathulata has a rosette of leavea with light-red tentacles and purple flowers, and is a native of Auatralia and New Zealand. D. Barkeana and D. ramentacea are South-African apecies, and are like miniatare form:
of $D$ apathulata, bat of a mach deeper red coloar. D. auriculata ponserses a slender stem with amall leaves, carrying long, lightibh-coloured tentacles. Othere which should be incladed are D. peltata, D. anglica, D. intermedia, and D. rotundifolia, the three latter natives of Britain. Drosophyllam lasitanicum, although incladed generally with thene plante, will be found to thrive in a compost of fibry loam and broken crocks. Uatil thoroaghly eatablished, they will need more care in watering. As soon as posibibe after germination, the amall seedlings should be placed in thamb-pote, an if allowed to stand in the seed-pote, less saccess will be made in their transference. Roridulas, whict are the giant of the genus, were growing here some fow years since, when plants attained the beight of between 5 and 6 feet. Lately peed, of R Gorgonias, received through the Royal Gardens, Kew, have germinated, and although only about 1 inch high, already show the gland apon their leaves. This, so far ae in at present known, under caltivation enjoy: a rather higher temperatare than many of the Droseraf, but with a better knowledge of the genas and ita requiremente, it may perbaps be found to grow as an amociate of thene planta. The wellknown North American Venas Fiy-trap, Dionea Mascipula, is very abandant, and succeeds well under the same conditions an afforded the other genera of this order, and is now forming ite remark able leaver. R. L. H., Edinburgh Botanical Garden.

## THE TUBEROUS BEGONIA.

Tar following extract are taken from a paper read at the Shanklin Literary Inatitation on Augat by Mr. W. W. Sheath. After giving a brief hittory of the origin of the taberous Begonia and its gradual evolation, Mr. Sheath detailed bis methode of crons breeding and seed-asving, and then went on to consider the method of

## Propagatios.

The B-gonis may be propagated by cuttinge as well at from seeda, and this process is uavally followed in the case of named varieties (oingle or doable). The cattinga can be taken when the planta atart in apring, as in the case of Dahlia cuttinge, about 3 inches in length, or when the plants throw side-shoots later in the season, but where ponible, they ahould be taken with a heel. Insert the cattinge round the aides of amall pote in light andy soil. I have found a balf-spent hotbed a good place in which to strike them, where the bottom-heat would be in excess of the top-hent, and not too moist, at they frequently damp in too moitt an atmonphere, or on thaded thelves in warm houses. Tney soon form roote in a exitable position, and also s bulb at the base of the catting. If cuttinga were taken in opring, they woald make flowering plante at the end of the anmmer, but later-strack cattings would not need repotting, but shoald be left in the pots they were atruck in until the following spring. In any case, plants from cuttings are not so vigorous as healthy seedlings.
Sow the reed from the middle of January to the middle of Marcb, to obtain flowering planta the same year, or they mag be sown in the summer and allowed to remain in the seed-pans or boxes antil started the ennaing apring. The following method is that to be recommended:-
The soil in which to sow the seed should consist of two parts loum to one each of leaf-monld and sand, and heat it anfficiently to destroy roots and seeds. or insects the soil may contain.
Drain the pans thoroughly, and fill to within an inch of the top with the compost, and make perfectly emooth and level, then give a good watering, and allow the eoil to drain well before sowing the seed. Sprinkle the reeds evenly and thinly over the surface, and then cramble enough dry and to keep the reeds from blowing away, but do not cover them entirely. Piace aheeta of glass over the pana, and also cover with paper for nine or ten days, so that the seeds be in semi-darkness ; put in gentle hot-bed, or in a temperature of $60^{\circ}$ to $70^{\circ}$, turning the glans daily to prevent the evaporated moisture from dropping
on the reed. Examine the seed pane, and if they thow any signs of dryneas, immerse the pans in water antil the moirtare ic sees aently to percolate the surface, not allowing it to float over the top, or the seed woald be diuplaced.
In aboat three weeka the seed abould have germinated aod be showing above the soil, bat be carefal not to allow the sun to shine fully on it at thic stage, or a few minates would soffice to rain them. As soon as the young seedlings show the firet leaf. they matt be pricked off. Prepare pans or boxet similar to the eed-pans, making the surface amooth and moist, and with a notched stick or label make a small bole in the soil, and lift the seedlinge carefally and drop in holee about an inch apart, gently presting the soil to them. It is qaite necenary to do this, as nometimes they damp off rapidy, especially if the sorface of the soil is at all green. It is a tedions affair, bat will repay all the troable bestowed on them in nach a small state, and can be done in eveninge with advantage. Water gently with a fioe rose to settle them, and place in a warm, moist temperstare, and shade from the san, as near the glass as postible. A, woon as they touch ench other they should be again pricked out or potted in amall pots, and kept warm antil they make a fair growth, when they will bear more air and light, and gradually harden off to the greenhoase or frame. If required for pota, ahift on into larger ones as required; but if for planting out, keep in the boxes and plant out the firat week in June.

## Pot Colture.

The ail for pot cultare shoald consist of the following ingredients (for the firat potting): 2 parta friable loam, 1 each of lenf-mould, and, and wellrotted manure; for the larger pots, use 3 parts loam in a rougher atate, 2 parta leaf-mould, 1 part of thoroughly decayed cow-manare, if obtainable, or other well-rotted manure, powdered charcoal, and enough sand to keep the whole porous.
If required to lower in May, thes shonld be atarted in Jannary, in a temperature of $60^{\circ}$; bat for ordinary eummer dieplay, March would be soon enough. Drain the pote in the ordinary way, uaing tizes according to the sixe of the bulbe, allowing an inch or more outaide the bulb to the sides of the pot, press ing the soil gently for the first potting, keeping the crown of the bolb level with the noil, not much water being required before they atart into growth. The top of the bulbe is sometimes bollow; where this is the case, water mast not be allowed to lodge there, or they will toon decay
As soon as the roote begin to ran round the sides of the ball of soil, they will require a thitt into a pot one or two sizes larger, bary them an inch deeper than in the previous potting, and prese the woil more firmly.

Unless plante of large sizs are required, this potting would be anficient, and planta can be kept growing late in the season, when the pots are full of roots, by the application of liquid manare in a weat atate, auch as soot and cow manure, immerned in baga in a tab of water, and ased in a clear state.
Avoid artificial or atrong manares either mixed in the zoil, or at a topdrescing, as, unless used by experienced hands, they will soon do harm to the plants.
A good light airy greenhouse, shaded from arrong annlight, will suit the plante when in bloom, or they will accommodate themeelves to almont any light airy position, whether in the conservatory, cold frames, or the cottege window, and may be termed air-loving, light-loving, and moitare-loting plants.

After the flowering newson is over, ripen the balbe by withbolding water gradually, and after the topn are died down, they may be laid on their sidet, ander greenhouse atagee, in the pota they have been grown in, covering over with alates or momething to keep the drip from the pota, or in a dry front-proof celler or room.

## Beddina

The Begonia has a great fatare before it an a bedding plant, as it can be used in so many way with such good effect. Oaly a mall space in required to
atore a great quantity through the winter season, and thus hested glass mtructures are not required to preerve them as they are for most bedding plantu.
Seedlinge are best for bedding, making robust and free growing plants, and these can be raised easily and in great numbers. Prick out into boses and tran plant in frames, or in sheltered places outdoors.

I generally plant out in framen, and after the plants are well into growth, throw off the light entirely, when they will flower freely in the antumn.

If certain colours are required, now is the time to elect them, and if any choice varieties present themelves, they can be marked for pot calture the following eason, or taken ap and carefally potted whilat in flower.
In autumn, previoun to the occurrence of cold nights or heavy raine, the light can be pat on to haten the ripening of the bulbs, and ahould be taken up when turning jellow at the top, or before frosts appear.

I like to dry the bulbe thoroughly after taking them up, and then to tore them thickly in cutting-boxes, crowns appermost, with some fine dry soil under and over the balbs. Keep in a dry place, which does not fall below $40^{\circ}$ in winter. A great quantity can be atored in this way, as the boxen, if of the ame sizo, can be piled one on the other.
In March, look over the tubers, and dircard any that may be decayed, and lay the reat in boxes on neveral inche of fine woil, sach as two part fine loam, one part each of leat mould and and, giving the bulbe room enough to transplant, with a ball of earth at bedding-time, and jast covering the bulbs with moil.
I find here in the aouth on the andercliff thone for bedding do not require to be atarted in heat; and if pat into pits or house where heat can be turned on in cold and fronty weather, they will be quite forward enough by the end of May. Care is required in the watering of these, as in the caue of potted plants, to avoid water aettling in the crowns.

In preparing the bedn, fork in light and gritty soil, such as leas-mould, road-grit (if the staple is heavy), and well-decayed manure (cow-manure if the moil it of a andy natare). In the last week of May, if the weather is fine, they caa be affely bedded out from the boxes, which are preferable to potted plante, as they lift from the boxen, with a mat of fibrous roots, and if carefally handled receive no check. Never let them auffer for want of water. When in full growth they revel in a good drenching, as last year, 1894, being a wet rearon, Begonias stood out in their glorg, whilst the zonal Pelargonium: made but a poor ahow. They continue to flower antil the autumn wind and frost pat an end to further growth, when they must be taken up and dried off, as directed with the frame needling.
I may here mention that Bogoniam make a good effect when uned other way than in the mase, auch as an oblong, oval, or round bed, dottod with Cannan, or as a ground work to abtropical beds, when thene are planted thinly and edged with bicolor and tricolor Pelargoniums, edged with Lobelis or Pyrethrum, or both; alio in larger bede, where pyramid Fuchaia are planted nome diatance apart, leaving room for Begoniat all round, edging with Golden Fegther, Lobelia at an outride finish.

## Insects.

The Bogoniae are not much ubject to insect pants but greenly in sometimes troublenome if grown in too much heat, or in too close an atmosphere. Potplante are sometims infestec with a kind of rust on the wtem and learen, whick aome growern asy in a fungus, but I have found it more prevalent when in too much heat in apring, aloo by audden changen of temperature, or draughtu, by iwperfect drainage-in fact, by anything that would cause a check in their growth, this ruat cauning the blooma and foliage to curl, and to be very brittle, mapping off at the least touct. When auch is the cape, atand them out in recover themeelven.

A mall maggot or grab ametimes does much miachiof by eating the bulb auderneath, and if not
detected or deatroyed will noon rain them. It is the ame grub often found eating double Primalas, Cyclamen, and Echeveria retuan. It in the larva of the Otiorhynchas alcatas, a brownish, hard weevil, aboat half an inch in length, and when disturbed, closes itself somewhat, and appear inactive. It can be caught at night when feeding. It will also eat the shoots and bunches of the Vine, \&co; and if in any quantity ther do a grest deal of mischief. The grab also gets into the Vine and Peach borders, and eata the roote.

## Fruit Register,

## THE SPITZENBERG APPLE.

Tue Spitzenberg Apple always bringa a better price per barrel than others, and the question was recently anked of the conductors why it was that, as this Apple brought a higher price, more of them were not grown, and by thas well stocking the market with them, bring the price down. This is a question which could be answered only by those who grow this Apple. Some say that the reason why it is grown at all is that it comes into market at a time when other varietie are scarce; whise others contend that the pecaliar flavour, 0 grateful to most tasten, is what gives it more appreciation. It does seem that only orchardiste can answer this question. Meehans' Monthly for August.

## Beurré Clairgeau Pear.

Among the higher classes of fruite, as well as among Strawberries and other mall fruits, there are changes in popalarity from one variety to another, often without any apparent reason; while there are some that continue in popular favour for a long time. Among Pear, one of the comparatively old varieties, known as Beursé Clairgean, is still in as much demand to-day as it ever wat, and is one of the atandard winter Pearn. It large nizs has recommended it, as well a good colour and comparatively high flavour. Meehans Monthly for August.

## The Week's Work.

## THE ORCHID HOUSES.

By W. H. White, Orehid Grower, Burford, Dorking.
Lelia pumila. - The dwarf-growing Lælia pumila and its varietie Dayana and preatans are very charming little plants when in flower. All of them are best cultivated in amall shallow pans, and sumpended close to the roof-glam. A mall quantity only of peat and aphagram-mons is requisite for them to root in, and this should alwayn be kept fairly moist, but now that the plants have commenced to grow, and until this is completed, increaned supplie hould be afforded. Through the summer the plants have been in the cool-house, but it in now adviable to remove them to a light position in the inter-mediate-house. The white cale in very hartfal to them, and whenever it appears the pent must be immediately eradicated.
mabdevallias.-The majority of Mandevallias are amosgat the mont eanily caltivated of Orchids, and if well grown they form a very prominent feature in the cool-houme. Sach ahowy and brilliantcoloured varieties as M. ignea, M. Veitchiana, M. amabilis, M. Mandyana, M. coccinea, and otheri, have a splendid effect when arranged with the lighter shaden of colour in Odontoglonmms of the criapum type. The dwarfer pecies, a M. Estradæ, M. Wageneriana, M. Wendlandiana, M. Armini, M. racemona, M. candata Shattleworthii, M. hieroglyphica, M. ionocharis, and the handsome bybrids, M. Courtauldiana, \&ce., form lovely objecta when covered with their amall but pretty flowers. Theme dwarf-growing plantashould be grown with their leaves close to the roof-glann, and muat never be allowed to become very dry at the rojt. Inatead of suspending them we find that they ancceed better when placed apon a raised ataging in a light position, where the atmosphere can more easily be kept moist. Contrasting greatly in growth with these dwarf varietien, is M. macrars, which has large thick fleahy leaves, and is a veritable giant of the genus. This beantilu! specien should at all season be kept at the warmest part of the house, but if the temperature fall mach
below $50^{\circ}$ during winter this plant, and M . tovarenen, M. ephippiam. M. Trochilus, M. qargantua, $\mathbf{K}^{\prime}$ Schlimii, and M. elepbanticeps, shoald be placed as the coolest end of the intermediate division. Seldo do we see a collection of Masdevallias free from black mark and potted leaves. The primien cause of this is that the plants have had too mad moisture at the roots or in the atmosphere darim artumn and winter. Even in the ammer they bayd not be kept in a satarated condition, bat bo allom to become nearly dry each time before they aremi watered. This practice should be specially obmen during the next six months. Another cause of "mon is a low and uneven temperature during the man period, perhape at a time whers the atmosphere of the house is at saturation point. The nearar the nigh temperature daring winter is kept to $50^{\circ}$ the betim, but during exceptionally cold weather, when mach fire-heat becomes necessary, it may be allowed to drop to $45^{\circ}$. Should the external air be above $45^{\circ}$, the ventilator ought always to be freely uned, and at other times also a little air should be admitted.
tIME TO RE-POT.-Repotting is best doneat thin season, bat it may be done in February if prefere able. Previous to this operation it is important then water hould be withheld from the plant for afom days, that the roots being drier may be leni injued. It is not necessary to re-pot large healthy apecimens annually, unless there is insufficient pot room; but if the compont has become decompond this may be carefully picked out, and fresh matorias abstituted. Orergrown masses that are bad in the centre mast be divided and potted-ap afresh, or they may be carefally separated, and pat into mall por for propagating parposes. All the strong-growing Masdevallias make many ruots, and require proportionate apace for their development. The pots should be two-thirds filled with drainage, and for placing round the plants ase good fibry pat and living phagaum in equal proportion, intero mizing it with a handful of crocks. Keep the baveof the plante about level with the rim of the pots, and carefally work the compost between the rooth. Po moderately firm, but not so hard that the wetar cannot pass rapidly through the whole mata, The critical time with Masdevallias is jast after repotting it being an easy matter to over-water them, For fow weeks water very sparingly, and as each planis becomes re-eatablished, gradually increase the apply The dwarf-tufted varieties already mentioned, and the amall but botanically-interenting apeciel, 9 . gemmata, M. muscosa, and others, succeed in cow paratively mall pots or shallow pana and nil species an M. leontogloses, M. platygloma, and M wertiæfolia, which produce their quaint flowers in downward direction, require banketa. The vellow flowered M. Davisii, M. Veitchians, and M. Cudsoni $x$ frequently send up atray bloom durik autuma, which, if not required by the hybridita hould be removed, so that the plant will give man flowers in their proper seanons.

TETE HARDY FRUIT GARD
Zy W. Pope, Gardener, Highclere Castle, Nawhy. GELECTION OF PLUMB FOR PLANNIN When making a selection of Plums, int planters ahould not fail to include Rivern Favourite. As an early deswert Plam it in s grow acquisition, ripening early in Jaly, and being dave over excellent in flavour. A fow other good Plums I will mention in the order in which dllial ripen:-Early Green Gage, The Czar, Saperh Golden, Dunnison': Superb, Haling' Green Gage, Biyanston's Gage, Parple Wher Tranparent Gage, Jeffernon's, Kirken, Gion ington, Coe' Golden Drop, Late Greperacion, Monarch, Raine Claude de Brahy, Blue Imper Dith Ick worth Imperatrice, Late Rivers, Grand Dinche A selection of good cooking varieties should the following:-Early Rivers or Early Pro Prince Orleans, Giabornes, Victoria, Dismond, Prich Wales, Pond' Seedling, and Belle de Septeming STRAWBERRY PLANTATION8.- All planting should now be completed for to If this has not been done, it will be them inf plants into auraery rown, and pat tation now becoming establithed shon watered till they have a firm hold of the sfice are growing freely, then keep the checking tirred with the hoe, which, benider chece will tend to render the young plants more aealthy by the sdminsion of warmeth and air roung plat neglect to cat away runion
thoroughly cleaned, and all partially-decared leaves removed. Thi will give a neat appearance, and be beneficial to the plants, by expoing the younger leaves and crown to the hardening influence of sunlight and air.

WATERING FRUIT BORDER8.-If there be a con tinaance of the dry weather all frait borders will require a thorough oaking of weak manure-water, or sewage, as soon as the fruit is gathered, more especially ander walls and in dry warm localities. This will greatly aniat trees that may be partially exbauted by heavy cropping, and do mach towards restoring their vigour. In mome instance aloo trees perfecting their crops may be much benefited by good wateringe of liquid-manare, this being especially needfal in the care of late Peaches and Pears. Grape-vinen, too, where the roots may be on dry borders or under warm walls, should be encouraged by wateringe daring the early part of September, hould dry weather prevail.

## PLANTS UNDHR GLASB.

By W. H. Sxrtry, Gardener, West Dean Park, Chichester.
THE CON8ERVATORY. - Should this structure require painting, the work should be undertaken as soon as is possible, that the smell of the paint may have time to depart before it is necessary to keep the house closed. If, however, repainting is not needed, the house hould be overhanled and thoroughly cleansed. Remove and gradaally dry off Achimenes and Gloxinias that have flowered. Thin out the shoote of any climbers that have finined flowering, to obtain as mach light as posuible. Of course, Bignoniae, Lapagerias, Bougainvilleag, Letiandras, \&ce., mast be left until later. Wash all the atages and pots, and see that every plant is perfectly clean before being brought into the house. Azaleas should be laid on their aide and thoroughly ayringed with tobacco water or mome good insecticide in case of any thrip. Large Palms, Oranges, Musas, Camellias, Azaleas, \&c. in large pota or tabs that have been stendiag outside, may then be brought in, the coil loomened, and a top-dressing of Clay sertiliser given them. A few of the early Chryanthemam of the Madame Deagrange type, which are showing theis bads, ahould be brought in before the flowers oper; also Lilium lancifolinm, late Fuchsias, Vallotar, Colosiat, \&cc., to make the house look at bright as ponsible through the autumn.

MIGNONETTE.-Pat late plant of Mignonette into their flowering pots, and pinch out all fowers to encourage the plants to emit side hoots. Keep them constantly tied, and place them in a little lighter poaition to barden the wood. Syringe two or three times daily. Plants intended for earlier uve, and which are now fall of roots, should receive plenty of manare-water. A prinkling of soot and Clay's Fertiliser mixed together, will keep them green and healthy. These hould atill have the flowers picked off until about a month befors they are required.

CHRY8ANTHEMUMB mast be kept regularly tied, and will now need disbadding, which mate be done carefally. All sackers should be removed, and the soil pricked over, and the plants given \& topdressing of good loam, leaf-soil, and mand, with the addition of a quantity of bone-meal and cot. Springe overy few days with clear weak soot-water, which will keep the foliage a good colour and help to prevent iojary by earwige, which are very abundant this year. Plant affected with mildew hould be placed by themaelves, and be dusted with flowers-of-sulphar.

TREE OR WINTER-FLOWERING CARNATIONB. Carnationa will need to be kept regalarly tied, but stopping should now be dincontinued. It green-Ely has made it appearance, the pest should be checked at once, or the plants will be diafigured and will not flower atiafactorily. Syringe the plante at night, and dute a little tobacco powder in the pointa of the whoots, Eyringing thit off the following morniag. When tying the plants, is sharp look-out shoald be kept for diaease, as this generally appears on the old grase, and can be kept in check by cutting it clean out and burning the affected parts. The Carnationhouse thould be thoroughly cleaned, and the stages and shingle washed, and it is a good plan to give the houve a thorough syringing with parafia-and-water a week or so before the plante are brought in.

ERUTTB UNDER GLABS
By Rtchard Parikr, Gationer, Goodwoog. Chichester. POTTINQ FRUIT TREE8.- Where auch fruite so Peachea, Nectarines, and Figs are grown in pota for
the prodaction of early crope, the repotting of these plant must be done at once. The sooner this in done when growth is completed, and before the foliage falls, the better, as new root form quickly daring the present month, and the trees will be thoroaghly eatabliuhed before they are again placed in the forcing-house. It may not be necestary in some cases, when the trees are in a healthy and fruitful condition, to repot the plants, a sarface dressing of freab material beiog all that is required. In auch cases, a much of the old woil should be removed with a sharppointed atick as possible without damaging the roots, replacing this with good fresh losm, to which has been added a duating of crashed boaes, some mortar-rabble, and wood-ashes. Ram the compont quite firm with a potting-atick, and make sare the drainage is quite perfect, at the wame time dialodge any worms by watering with lime-water. Trees in an unhealthy atate boald be tarned out of their pote, and the root carefully examined, cutting away any portione that are decayed, and removing all soil that has become soar. After doing this, it may be better to repot the trees into maller pot for a season, and water carefully until new roots are formed. Good drainage and firm potting are two essential points to be observed. After potting, the plaats ahould be placed on bricks or coal-aahes, watered carefally, and ayringed overhead during bright weather. Some protection will be required daring wet weather to prevent the soil becoming asturated with water before the roots are active. Apples, Pears, Plams, and Cherries will require aimilar treatment, but as these are not forced so early as the former, these may be left until later in the month.

VINE AND PEACH BORDERB.-Much of the old soil may be removed from the borders in early hoases and the borders extended or top-dressed, as the case may require. The compost used should be in a fairly moist condition, and consiat of the ame material as recommended for trees in pots, but in a rougher atate. Avoid farm-yard manare, which is more valuable as a top-dreating during the growing meason than as an ingredient in the compost. The border should be beaten with the back of a fork to make it Taite firm. Continue to keep the foliage healthy by ayringing frequently

## THE KITOEEN GARDEN.

By Joher Lambert, Giardener, Powis Cantle, Welehpool.
celery.-The Celery crop has advanced rapidly of late, and that portion intended for use until Christmas, is quite ready for a preliminary earthingup. When it has been well cleaned and tied, apply to the soil, along each side. a sprinkling of salt to kill slags and other pesta. Siadringham Dwarf White, and white varietien generally, are nreferable for early work, bat red ouen appear to me the better able to withstand the winter. Provided atrong etardy planta are at hand, a :late batch may still be put out, and will be likely to be of use in the spring.

OMERKINB FOR PICKLING should bo gathered in dry weather as they become fit. Do not allow them to get too big, but try to obtain a large quantity ready to cut at the ame time. When the plant are exbauted, have the heaps of manure well mixed by turning, that it may be ready for garden purpowen.

CHILLIES AND CAPBICUMB required for pickling parposes, if planted out in cool frames, may have the ligbts placed over them to assist the ripening process. If they are outaide in a favourable border, they may bo carefully lifted and potted, and put in heat ander glass. Plante growing through the summer in pots will produce an abandance of fruit, without any trouble in regard to ripening.

EPINACH.-Another sowing may be made of the improved round-leal variety for winter use. Allow plenty of room between the rows, and do not sow soo thickly. Spinach in frequently rained daring its early atage, owing to the crop being inanficiently thinged. Use plenty of soot at a dressing for this crop.

FRENCH BEANS,-Make mother sowing of these is heated pits or frames. Beane like a alight bottomheat from leaver and litter, but the material must be well prepared first, so that the heat will lant until the cropa are finished. If the pits have not already been whahed with hot lime, and the woodwork newly painted or well scrubbed with soft-soap and water, this work should be firnt performed. Let the manare settle well down before adding the soil for the Bean to grow in. The compost may consist of
good loam four parte, leaf-moil one part, barnt refue and mortar-rubble one part, and epent Mashoombed manure one part, with a lirte soot and bonemeal added. Well mix thil together, und put it in the pits to warm before sowing the Beans. which may be pat in row not nearer to each other than ' feet. Choo varietie having dwarf, compact tope. If Beans are to be grown in pote inside daring the winter, preparations for them should now be made. Provide good drainaze, and leave space for a top-dres. ing. Afterward when thinning the plante, put five is an 8 -inch pot, which is a very convenient size for une. Cool frames or pits will be a saitable place for them to be placed in at present. Grow them at hardy an poanible, but as the cool night and damp weather approach, afford a little covering at night, and a little fire-heat aiso.

TOMATO8 on walls or trained to aticks ahould have all side-bhoots removed and nome of the leaves shortened back, to expose the fruite to the sun and air mach an possible. Look over the plants frequently and remove all fraits that are colouring, and place them in a light airy house to ripen.

THE FLOWER GARDEN.
By Bailey Wadds. Gardener, Birdsall Gardens. York.
PLEASURE - GROUNDS AND FLOWER BEDS.Grasa lawne should be given close attention in regard to mowing, aweeping, and rolling frequently. If a heavy lawa-mower is uued, there may be no occasion to roll, but otherwise the appearance of a lawn is very much improved by a heavy roller. For large lawn there is none better than a good-nized water-roll, the weight of which can be regulated an desired. Take out Plantain and other weed from the grase, either by digging with a knife, or a boy may tale a bottle of sulpharic acid and a thin iron prod, which should be dipped into the acid and then thrast into the centre of the weed. The operation require care, however, that pot of the acid are not dropped about. The iron ahould only be wet; it does not want a drop of liquid on the end of it. Flower-bed are now looking well, and every endeavour should bs made to maintain this department as attractive as possible by weeding bede and borders, trimming edginga and by the removal of decayed fower-atems and leaves, When cutting are taken from Pelargonium-beds, it should be carefully done, wo that the bedn are not left untidy. Small bede of Pelargoniams ought to be cat little or aone, and if a quantity of plant are pat out in a reserve garden to furnish cattings, wo much the better. Rhododendrons. Azaleas, Kalmias, and other American plant which have suffered from the drought, will be greatly helped by thorough soakinge of water. Old flower trasses should be taken off, and everything done to help them to complete their growth. Gravel walke and road require frequent hand-weeding, for the use of the hoe and rake on gravel should be avoided at mach as possible. Notice should be taken, while the leaves are still on the trees, of deciduons tree or shrabs thet require thinning. The arrangement of trees and shrub around a mansion or villa reaidence requires mach tante and forethought ; overcrowding inould at all times be avoided, and deciduon trees and ahrabs are better planted at a little dintapce, thu preference being given to bright-foliaged evergreen thrabe and coniferon plants, which will give warmth and colour daring the winter month.

FORMATION OF NEW PLEASURE-GROUND8. The formation of new pleasare-groands, or contemplated additions to old ones, should be arranged for now, staking out the approach roads, paths, and thrabbery aiten as soon an posible, that the work arabbe taken in hand during the antumn. The may be taken in hand during the antumn, The and their courmas through parke and woadlande the work. The width of carriage - drives should be suffisient to allow carriagen to pass each other and turn without diffenlty. Ragerdiog their formation, tho bottom should be well drained, and the depth of road matarial not fower than 12 inches The bottom may be made of chalk, free-atone, or ballast, with 6 inches of granite above it, and about 3 inches of fine gravel at the top. The arface mut be made so that water will get quickly away. Footpathe do not require to be made oo deep, but the anme material hould be uned, and good draiagge given. The cleaniag out of ornamental watercoursen and pond mast be completed before the fine weather is over

## EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.
Letters for Publication. - All communications intended for mublication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTER ON ONE SIDE ONLT OF THE PAPER, ent as early in the week as possible, and duly signed by the wriler. If desired, the signature will not be printed, but lept as a guarantes of good faith. The Editor does not undertale to pay for any contributions, or to return unused commumications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.
MEETING.

Great Annual Unreserved Sale of Winter-blooming Heaths and othes plants at the Burnt $A$ sh Road Nurseries, Lee, Kent. by order of Messrs. B. Maller \& Sons, by Protheroe \& Morris. Dutch Bulbs at Protheroe \& Morris Rooms. Rooms.

Great Annual Unreserved Sale of Winter-flowering and other Wlants at the Nurseriea, South Fraser, by Protheroe \& Mrorris. Dutch Bulbs at Pratheroe \& Morris Brooms.
Great Annual Unreserved Sale of Heaths, Stove and Greenhouse Plants, at the Brimodown Nur-
series, Enfield Highway, of Mr. John Maller, by Protheroe \& Morris.
Dutch Bulbs at Protheroe \& Morris Rooms.
Great Annual Unreserved Sal of winter-blooming Heaths Aale of Longlands Nureeries, Sidcup, by order of $M$ Nuseries, sidcup, by
FRIDAY.
SEPT. 13 by Protherce \& Moria
Dutct Bulbs at Protheroe \& Morris' Roome.
Orchids at Protheros \& Morris' Rooms.

CORRECTED AVERAGE TEMPERATURR FOR THE ENSUING WEEK, DEDUCRD FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT ORISWICK, $08^{\circ} .4$

Apple trees trained on a roof, and other fruits.

A correspondent, writing from Scotland reoently, remarks on some Apple trees which he had seen trained over the roof of a coltage in that country, and on the rarity of such an ocourrence in these islands. It is perhaps one proof the more of the manner in which we negleot our opportonities, and let in the outsider, with his well-ripened, high-osloured, nicelooking fruits. There are only two reasons why our country cousins should not atilise the walls of briok, wood, \&o., of their barns, stables, and dwellings, in growing, not only the tenderer varieties of Apples and Pears, but Grapes, Figs, Peachen, Apricots, the finer dessert Plums, the Lawton, and other American Blaokberries, and those reasons are the lack of secure tenancy in the case of those who rent houses and land, and the want of compensation for improvements. It may be alleged that the average farmer, and cottagers and villagers generally, lack the requisite knowledge ; but that will, we hope, soon be altered by the peripatetic lecturers of the various County Councils. And we ought soon to harious a County
young folk in all parts of the country, who having attended these horticultaral courses, will be quite competent to afford advice on the management of fruit trees to those who need it, and also perform the neeessary operations wherever it may be desired. Indeed, there seem to be openings in this line which would, in a short time, give employment to many a man and woman too, who now hardly knows, in the crowded state of nearly all industries, what to turn his or her hand to, to earn the wherewithal to exist in comfort. We have the jobbing gardener, bat he is too often a "puir silly body," with a very small amount of the necessary knowledge. In the matter of fruit trees and bushes he is either a ruthless praner, pruning without knowledge, or he sniggles here and there, and makes thickets of them. Roughly speaking, all the kinds of fruits we have named, can be readily grown in soil that is well-drained, and fairly fertile by Nature or art, in the country south of a line drawn from King's Lynn to Chester, the Grapes, Figs, and Peaches, having south or east walls; and Pears and Apples, and perhaps, Figs and Apricots north of that line, with protection during the winter for the Figs, and in the spring for the last-named when in blossom.

Mr. Barrox's
Wr have received the following Retirement. commanication from the Council of the Royal Horticultural Society relating to the circumstances connected with the retirement of Mr. Barron from the management of the gardens at Chiswick:-
"Royal Horticultural Society.
"117, Victoria Street, S. W., Sept. 2, 1895.
"The Council of the Royal Horticultual Society have read with aurprise and regret the remarks which have lately appeared in some of the horticultural newspapers with regard to Mr. Barron's retirement. The Council have for aome time had before them the deairability of making considerable changes in the gardens at Chiswick, and in the early part of this year they determined to initiate these changes in the near future.
"Fally aware of the value of Mr. Barron"s aervicen for upwards of thirty years, recogniaing that he had well earned and thoroughly dewerved a retiring pension, and anxiou to show him every conaideration, the Council felt that at hia age they could not fairly place upon him the burden of ach a re-organiation as they contemplated; and they considered that they were consulting his best interents an well as thone of the Gardens in offering him retirement on an allowance of £180 a-year.
"In replying to the conncil's communications, Mr. Babron thanked them for their generous recognition of his claims, accepted their proposal, and tendered his renignation from Jan. 1, 1896. The Council are glad to know and to be able to asaure the Fellown of the Society that he is perfectly aatiafied.
"Having acted juetly and generouly towarde Mr. Bamboss, at they believe and to his aatiafaction, the Council deemed the matter aettled, and were themselves intending to promote a tentimonial to him on his retirement, when they found that ateps in that direction had already been taken.

The Council regret to find that they are charged with diacoarteny toward the Chiswick Board. The charge reate on their appointment of a special committee to advine them an to the future of the Garden without communication with the board. They freely admit that it would have been adviaable to have conferred with the board on the appointment of this committee. To any membern of the board who may have felt themselve slighted at their omisuion to do so, they offer a frank expremion of regret. They need acarcely say that the omisaion was due to an overnight, and not to any intentional discourteny.
"By order of the Council,
"W. Wilks, Secretary."

The Testimonial to Mr. Barron,-We have received the following from Sir Tarvor Lur Bence, Bart. :-"While I cannot but think it anfor. tunate that the proposal to present a teatimonial to Mr. Barron on his retirement from the mervica of the Royal Horticaltaral Society should be mixed ep with an attack on the Council, I ahould be sorty were this to prevent anyone from aubscribing to s well-deserved recognition of the work of an old ald valued servant of the Society. I have pleawnois enclosing my own subscription, and tratit that will unite in promoting an object which canwoll to secure complete and general aympathy.-Tmon Lawbence.

We have been requested to state that it consequence of several members of the Frait $\mathrm{C}_{\mathrm{m}}$. mittee having expressed a desire to be amociatod by their contribations with the general testimonial that has been insugurated, the proposal to preent a special one from the Fruit Committee to Mr, Barron as Secretary will not now be proceeded with, as it could only have merit if shared in unanimouals, It is, however, the earneat wish of the promotera, thit on his retirement from office the Council mould raill seek to preaerve Mr. Babron's unique knowledge to the committee by offering him the position of a lith membership of that body, with which he has been in long and so honourably connected.

Royal Horticultural Society.-The peat meeting of the Royal Horticultural Society will be at Chiswick Gardens on Tueaday, Sept. 10. Prita are offered in forty different classes for vegetablen, and a good show is anticipated. In addition to the vegetables, however, the unual collections of hity plante, Orchida, cut flowers, fruit, \&c.n will bo received at Chiswick, and any new or rare apecimas will be examined by the various committeet, whild meet there at twelve o'clock noon. At half-patt one there will be a vegetarian lancheon arranged by $A$ Hills, Esq., President of the Vegetarian Fedend Union; and at three o'clock a lecture on "Gardes Manuren," by Mr. W. G. Watson, will be rend. Kg. hibite may be removed at aix oclock.

Sydney Botanic Garden (ree Sapplementer) Illustration). -We are indebted to the veteran curater of the Sydney Botanic Garden for the accompanyist illustration of a group of Palms, with a man of the blue Nymphæa atellata in the lake in the foreground The Water-Lily had forty-one flowern open at the asme time within a epace of 4 feet in diameth Nymphas tellata is a tropical apecies, bat 14 Latour Mabliac has enriched our gardens with whole meries of lovely varietien quite hardy in thin country.

The "Journal of the Royal honticulTURAL SOCIETY."-The last number of the Jownims completes the nineteenth volume, and is a worthy succeasor to those that have preceded it. it contian mont of the papere read at the Drill Hall meting il the apring, inclading Mr. Bazer's reviaion of meall work in the genus Primala, and Dr. Mosris' excullan account of the plant and gardens of the Camer Islands, a aubstantial addition to our knowledg The Journal reflects credit on the Society, securea for the country Fellown a retarn for theil aubscription that they would not otherwise obtain.

Devonbhire Technical inatauction col MITTEE,-Mr. Chas. Berry, horticultural lecturet the East Saffolk Connty Council Technical Inutrat tion Committee, has been appointed instructer of horticultare by the Davonshire Counts Council, at will enter upon his daties at the end of tha month

National Chrybanthemum society. meeting of the general committee took place the the 26th ulto, Mr. B. WyNNE in the chair. y . Secretary, having announced the death of the did Aeteur Worthey, who in the early days of Stoke Newington Chryanathemam Society the office of Secretary, the following rentur unanimounly parned:-" That this commiwe pid on record an expreation of the morrow with antill hat heard of the recent death of Mr , surn

Palms and Lake with Blue Water-Lily, Sydney Botanic Garden.

Wortley, formerly Secretary of the Stoke Newington Chryanthemum Seciety, to which office he was elected in 1851, and bears in grateful remembrance his services to the Society, and to the Chrysanthemum in that capacity, and also as an old cultivator and exhibitor of the 'golden flower.'" It was farther resolved that a copy of this renolution be sent to the relatives of Mr. Abthur Wortley. Mr. Geo. Walker, Paddington, and Mr. W. A. Holmes, mon of the late Secretary to the Society, ware elfected to vacancies on the general committee ; and Mr. J. McHattis, The Gardens, Strathfieldaaye, to a vacancy on the Floral Committee. A achedule revision rab-committee was appointed to revise the chedules of prizes for September, October, and December. The Jabilee celebration aub-committee, appointed to prepare a scheme for the proper celebration of the Jubilee of the Society in 1896, made a report, and the same was accepted, a committee being appointed to carry out the same. Twentythree ordinary members and two Fellows were elected.

The Effects of Lightning.-Daring one of the recent severe thunderatorms, three Scotch Fir on the outskirts of the wood, about 50 yards from my cottage, were atruck by lightning. As I have never before heard of several trees being thas atrack at once, I send a few particulars, which may be of interest to your readers. The trees, measured from centre to centre, form an obtuse-angled triangle, Whose aides are 17 feet 6 inches, 12 feet, and 10 feet rempectively. The largest of the tree is 50 inches in girth at 3 feet from the groand, and the smallest 28 incher. The trees vary very considerably (more than 10 feet) in height, and they are arrounded by other Fir trees, many of which are more lofty than these. The injared trees are marked in the usual way by vertical lines, from which both the outer and the inner bark has been atripped. There are no aigns that the lightning has passed from tree to tree, and I preame that one discharge has become separated over this considerable area. It would be interenting to learn whether aimilar instances of the effect of lightning have been recorded in this country. Gilbert R. Redgrave, Absoc. Inat. C.E., Grove Dale, Abinger, August 26. The Times.

The World's Wheat Crops.-The Hangarian Minister of Agriculture at Buds-Pesth, on Friday evening published the aggregate result of, the data obtained from the reports of the various consals, agricultural apecialiats, and other correpondents, concerning the world's Wheat crop for the seazon 1895. The total production of Wheat in the import countries (that is, the countries which have to applement their home productions of cereal. by imports from abroad) is estimated at $264,160,000$ hectolitres, or $749,422,000$ bushelr, and the production in the export countries in estimated at a total of $582,200,000$ hectolitres, or $1,651,701.000$ bushels, making the total Wheat crop of the world this year 846360000 hectolitres, or 2401123,000 buabel. The Minister has also amended the eatimate pablished at the end of August last year of the 1894 crops, by increasing his then estimate of the total gield of 872,780000 hectolitres, or 2476000000 bushels, by $55,000,000$ hectolitres to $928 \mathrm{C00}, 000$ bectolitres, or $2,632,736, \mathrm{C} 00$ bahele thu making this year's world's crop of Wheat 82,000000 bectolitres, or $232,000,000$ bushele, maller than that of laat jear. Agricultural Gazette, August 26.

The Nelumbium in Eaypt.-Readers who recall the interesting notes on this anbject published in these columns in the apring from the pens of Dr. Bovavia and Mr. Flinders Petrie, will be interented in the following extract from Garden and Forest of Aug. 21 : -"The purpose of this note is simply to call attention to the fact that in the Abbot Collection of Egyptian Antiquities, now the property of the New York Historical Society, and on exhibition in the room of the Society in the City of New York, there are pecimens of the leaven of Nelumbinun specionam, obtained from Egyptiam tombs, wonder-
fully well preserved after the lapse of twenty or thirty centaries.

Introduction of the Bermuda Lily.The Bermada Lily wat first brought to America from the Island of Barmada in 1876, by Mrs. Tromas P. Sargent, Assiatant Parchaing Agent of the Pennsylvania Railrozd. When she was leaving the ialand, in the apring of that year, two friend residing there gave her a few of the Lily bulb. Upon her arrival at her home she preasted nome of them to Mr. Robert Crawford, a near-by florist, who about a year later mold tha increase to Mr. William Habris, of Philadelphia. He began growing the bulbs, and offered them to the public, with the addition of his name, as Lilium Harrisii. Mra. Sargent was an invalid for many years. Her hcme in the subarbs of Philadelphia was a centre for all that is lovely in plant growth, and her life was as beatiful and beneficent as the choice flowers with"which she surrounded herself. Vick's Magazine. [We want to know now how the Japanene Lily came to be cultivated in Bermuda ?]

Bicolor Plum.-Through Mr. Ladhams, of Shirley, near Southampton, we have received parple and yellow Plums taken from the ame tree. It appears that the occurrence has happened two years in sacceasion. The case is aimilar to the occurrence of black and white Grapes on the asme Vine, and of Peaches and Nectarines on the ame shoot, and is probably due to a separation of previously mixed characteriatics, but what causen the audden change is quite anknown.

The Cedar of Goa.-The laat part of the Boletim da Sociedade Broteriana containe a Portuguene tranalation of Dr. Mastres' paper on the Cedar of Goa by Profensor Henriques. The Professor adds a note that the structure of the slab of wood found beneath the arface of the soil in the Azores island is identical with that of Janiperas brevifolia; and microscopical epacimens which he has been kind enough to sabmit to us amply bear out his opinions. Janiperas brevifolia in the island of S . Jorge attains a height of over 3 mèses, and the trunk a circumference of 1 m .30 c .

Publications Received.-The Amateur Orchid Cultivators' Guide Book, 2ad edit., by H. A. Borberry. Published by Brake \& Mackenzin, Liver-pool.-Analytical Key to the Natural Orders of Flowering Plants, by Franz Thonner. Pablished by Mearr. Swan, Sonnenschein \& Co., London.

## Home Correspondence.

APOQAMIC FERNS.-It is with urprise that I learn from Mr. Drüery's paper on apogamic Ferns (Gardeners' Chronicle, August 24), that Nephrodium (Lastrea) paleacenm var, cristatum (Crented Male Fern), is according to De Bary, dentitute of archegonia, and therefore that varieties cannot be raised from ite apores. The original plant was found at Charleston, in Cornwall, and as far back as 1857 the late Mr. Jamen, of Vauvert, gave me fertile pinna, and from these ome handreds of olants were raised. I gave a pinns to Mr. Clift, of Balaall Heath, and from thea there mast have been nearly a thousand needlinge. Between 1862 and 1868 a lirge number of seedlings were raised at Hightield Hoane, and amongat them were varieties Belferi and Winatanlyi, the latter deacribed in Our Native Ferns, in 1869. Other croses were made subsequently, notably with variegatum (a normal but variegated variety of N. Filix mas) ; in this batch of several handred plants every seedling was created, and had more or less the characters of cristatum. Mr. Wollaston of Chiselharat. Mr. Sim of Foot's Cray, Mr. Clapham and Mr. Glase of Scarborough, Mr. Willson of Whitby, Mr. Fox of Briatol, and Dr. Lyell of Newbary, all rained plants of this Fern. Mr. Sim raised one known as criatatum-anguatatum, and Mr. Lyell neveral distinct congested forms; although apogamic, neverthelesa archegonia mast have been present, or no varieties could have resulted. In 1890 I had a pan of Scolopendriam prothalli in which the whole of them merely developed into thorns, eventually forming a bunch of thorne, and afterwards producing several curiou fronde, but they reverted to thorns,
and are now all dead. Qaite recently botaniats told us that it was imponible to cron Ferne, and also that onlv one plant eprong up from each prothallua. From 1867, year after year, this was pointed cut to be incorrect, but it was nearly twenty years before Fern crosing wasacknowledged; and, as regarde plante from a single prothallas, two, three, four, and five have resulted, and further by dividing and abb-dividing a prothallus nearly 100 plants can be produced, and moreover, thene divisions can be continued until some of them have none of the original prothallas ; after this, new generative organs are formed, and much more prolific in offspring. E. J. Lowe, F.R S. P.S.Additional information on the varieties of Nephrodium paleaceumean be found on p. 90 of Fern Growing, and p. 138 of British Forns and where found. E. J. L.

CYPRIPEDIUM $\times$ LORD DERBY. - Referring to the paragraph in Gardeners' Chronicle. p. 245, on Cypripedium $\times$ Lord Derby, in which Mr. Statter ie said to have written that the plant "W. R. Lee" being dead, there was not another plant of the same parentage that had bloomed which was alive. I beg to say that I have such a plant, it parentage being C. auperbiens $\times$ C. Elliotianam. The plant bloomed and was shown at the same Royal Horticultural Society" meeting at which "W. R. Lee" received an Award of Merit. I showed my plant under the name of "C. Mabellianum." I obtained it from Mears. Sander as a seedling, it is still alive and doing well, although I do not think it will flower again this year. Walter C. Clark, Orleans House, Sefton Park, Liverpool.

WASPB.-Thene peat have only jut made their appearance in force in my garden in the Fen district of Lincolnshire. Last year shey took the whole of my early Pear fally six weeka before the present date. It often happens that they make their nest in a thatched roof or atack, in which case fire is out of the queation; under these circumstances, and indeed in most others, my plan is an follows:-Take a widemouthed bottle, with a closely-fitting cork, through which pass a short piece of glass tube; to the top end of this tabe an india-rubber tabe aboat 2 feet in length is attached. Sulphide of iron is placed in the bottle, and jast covered with water, the end of the india-rubber tube is inserted into the hole, which lead to the neat, and packed round with damp clay or earth to prevent the eacape of gas, strong hydrochloric acid in then poured
into the bottle, and the cork at once ineerted. Sulpharetted hydrogen is generated, and not a wasp will be left alive in ten minutes. Salphuretted hydrogen is the gas which gives the smell to a rotten egg, and in it concentrated form, an that applied, is a deadly poison to all organic life. I took four nesta last year by this meana in a little more than half an hour, and one was in a thatched roof covered with Ivy. Of course, the operation should be conducted at night, when the waps are all at home, R.K.
chiawick veaetable show.-Kindly permit me to augeat to all who may be engaged in the work of judging the vegetablen at Cniswick on Tuenday next, that ome effort be made, not merely to have all the judgments in harmony, but also that standards of excellence be also, so far as the respective exhibits will allow, be uet up. The proposed code of judging, which includes inatruction ar to the atandards of excellence in vegetables, is onfortanately not jet ready. Were it available, mach help towards securing the deaired result might have been furnished. Failing that, and knowing how severely judgment by the Royal Horticultural Society are criticised and utilised an atandards elsewhere, the present opportunity to exhibit higher and conaistent ideala in relation to ins, form, quality, \&cc., is so important that it can hardly be too fully utilised. In no deacription of produce at exhibitions does there seem to be found in making awards more diveraity than in connection with regetables. At Chiswick, apart from thewe collections, there are ample scope for the selection of the bent forme and higheat quality. The opportunity is so good a one that it cannot be more worthily utilised. A. D.

TOMATOB AT MR. W. LAWRENBON'S NUREERY, EAGLEACLIFFE FARM.-I had the pleanure to look over these nurseries recently, and some of the Tomaton which I asw growing there were to my mind perfect. Mr. Lawrenson, who believes in doing thing well, hat now obtained, through years of careful selection, three distinct varieties of Tomatos, which are grown under exactly similar treatment as some other crack varieties, and which have outdiatanced the latter by far. All are very
free settera, bearing large clasters of even, goodsized, handoome deep Aeshy , carlet frait, the lowets bunches lying almost on the rima of the potr. The clautere are borne on aturdy short jointed single rods 7 to 8 inches apart-the height of the rode is about 8 feet. Mr. Lawrenson informs me that the yield per plant, when all are ripened off, is 12 to 14 lb . Thit io a good performance for spring-town plants, grown in 9 -inch pote, and merely aet on a thick sod 15 inches rquare. course, the planto are well sapplied with manarial sids to growtb. I have never, duriag many years of experience in Tomato caltare, neen anytbing equal theae Tomatos at Eaglescliffe, and I am glad to hear that Mr. Lawrenson intends to send seed of them out next spring. Tomato growers who have now to competo with foreign cultivators of Tomatos
sending over very large ganatities varieties which can be thoroughly depended apon for ture eropping, as a good many of my friends Fill have found out by now that Tomato growing is not all profit. Experientia docet.

THE LARGE CEDAR TREE AT BEECHWOOD PARK, HERTFORDSHIPE. - Seeing the account of large Cedars in your issue of Aaguat 3, I am reminded of a fine specimen which now stands in Beechwood Park, Herte, the seat of Sir Egbert Sebright, Bart. The height of it is close upon 100 feet, and the circumference of the stem, 5 feet from the ground, is 29 feet. I feel are Mr. Freeman, the gardener there, would be plassed to corroborate my atatement. G. Shepherd, The Lilies, Aylesbury.

## "THE SWEET LITTLE, DEAR LITTLE, BHAMROCK

 Of Ireland."-Referring to Mr. Tuckwell's note on the above in your issue of August 10, I must, as an Irithmad, express the opinion that he is mistaken in his idea that "Shamrock is a name common to all triphyllate plants found growing on March 17." Anybody who han een the caretal searching in the fielde a few daps prior to March 17, will have noticed that in gathering apecimens of the national badge, the Irichman does not alway pick up the first trifoliolate plant he meets, but that with the greateat care he proceed. to telect what he regardis as the true species, which, he will tell you, is known by its small, perfectly green leaves, and wiry much-branched atems, characteristic which are certainly more marked in Trifoliam minus than in any other specier. Living, as I have alway done, in the south of Ireland, I have many timen watched my neighbours Shamrock-gathering. I have had Shamrocks brought to me by people who professed to know the real plant, and have often examined the sprays sold in the streets and sbops for sending to friends abroad as well as those worn on St. Patrick' Day, and as a resalt, am convinced that for Irishmen, in the south at any rate, there is but one true Shamrock, snd that is, without doubt, Trifolium minus. T. repens and Medicago, I believe, are used only in mistake by those who are not observant enough to notice that there are more kind of Trefoil than one, and I have seen auch an individual wearing T. repene, with "Clover." his ignorance in decorating himself with "Clover.' That T. minus is regarded throughout Ireland as the Shamrock by those whose interest it is to know it, is, I think, fairly demonatrated bythe fact that flowering specimers of it are offered for ale during the summer months to tourist by the sale during the summer months to tourists by the guides and peasants at Killarney; and alvo by the facturery of Cariatman and Sc. Patrick' Day card on which mprajs of natural shamrock are mounted, While Irithmen are patriotic enongh to this apecies. wear the Shamrock Mr. Tuck enough to aeek for and they will ahare his belief that any other plant will do at well as the pretty little one known botanically as Trifoliam minas. While on the abject of national emblems, perhaps. Mr. Tuctwell or some other correspondent woald kindly inform a which of the of the twenty in the typical Scotch plant, or which British wild Rone enumerated in the three varieties of of British Plants ( 9 ih ed.), we are to regard as the foral emblem of old England. R.A. Phillips, Cork.

FOOD FEQUIREMENT OF THE CHRYSANTHE-MUM.-I have read Mr. M. R. Aaderten' remarks your recent isac. Four corresponded on p. 181 in of his experiment with Correspondent, in telling un some lack of knowledge of the subjums, pxhibite us:- I have got a complete analyuict. He telle which he calla light and poor, and yet, further on
he ways :- "My soil is rather rich in potash," and this, together with the remark that it is a fibry turf, naturally leads one to suppose the soil is not so poor after all. Be this as it may, I for one should like to have seen its analyais. Another point I noticed in connection with the soil was the quantity of rabbish he mixed with it (two parts out of five);
surely this abstance would not improve it very macb, for although this is a good thing to put on land or mix with border soil, it cannot be recommended for pot plante, especially such vigorous growers as Chryanthemums. But to return to the quastion which concerna us most, i. $\theta_{0}$, the use of artificial manares. I noticed your correspondent ased an entirely different manare to that recommended either by Mr. Willis or myself-with what
result? He say:-"The plants made but little progress, the leave were small and of a yellowithgreen colour." And why? Because they were lacking one of their mont easential food constituents, viz, nitrogen. "If the plants have not a nufficient apply of nitrogen in the soil, it can be detected by a lack of vigoar in their growth; the plants look hard and stuntad, the leaves are of a pale yellowish colour, and the growing point is weak" (p. 6 of
Manures and their Application, by W. Dyke). Bat Manures and their Application, by W. Dgke). Bat
then jour correspondent will perhaps aay, did I not give them 4 per cent. of nitrogen in the mixtare i used? Yos who, with the most elementary knowledge of manares, would mix two substances like banic slag and sulphate of ammonia together? The caustic lime contained in the slag (about 50 per cent.) woald at once combine with the sulphuric acid which is united with-and holds-the ammonia, liberating the latter as a gas, which would then escape into the atmosphere and be lost. Mr. Andersen saya he "has a good apply of nitrogen in the atable-manure." He
evidently does not know that 1 ton of farmyardevidently doea not know that 1 ton of farmyard-
manare only containg 12 lb , of nitrogen, and thim chiefly an organic nitrogen. The nitrogen in the atable-manare and fibres of the turf could only become very slowly available for the use of the plant, and in my experiments with Chrysanthemums I have found there is nothing which stimalates their growth like nitrate of soda and potash. A nitrate $I$ have recently uwed for experiment changed the colour of the foliage from a pale yellowish-green colour to a very dary olive-green in three days. The nitrate in question is ammoniam-nitrate, which containe twice as mach nitrogen as nitrate of soda. Care must be taken when asing this substance, or the plant may be injared. If plants be overfed with artificial manares, they would not have the appearance as described by Mr. Andersen, as their foliage would look very dark green; this can soon be remedied by keeping the woil rather dry for a time. Your correspondent thought his mixture was in accordance with the requirement of the Chrysanthemum. Bat why, when giving as the analyeis, did he omit to say that the mixtare also contained 29 per cent. of sulphuric acid and 19 per cent. of chlorine? The plant only If quire $4 \frac{1}{2}$ per cent. of the former and 3 per cent. of the latter ingredients. The chlorine would mont probably unite with lime, forming chloride of lime, a abatance very ivjurious to vegetation. Your correspondent ask*, "What renult such a quantity of artificial manure as I recommended would have?" Why did he not try its effect as recommended, and report the results? and not try something entirely different, and then asy "theory haa here without any caution being uned, given very dangeroue advice." It would have been so had he proved the quantity was too strong for the planta, but from experimente I bave carried out with Chrysanthemama I can may that the quantity can be used With safety, although it might be advieable to use lesser quantities with very fertile soill. In conclusion, I think, the past thirteen yeara of practical experience hai targht me not to recommend anything I have very few plants which found beneficial. There are very few plants which will atand with advantage so much feeding as Chrysanthemums, providing the mechanical condition of ail be well looked after.

VEITCH'S CLIMBING FRENCH AND \&UTTON'S TENDER-AND-TRUE BEANB. - It reems a great pity that the Ernit Committee of the Ropal Horticultural Society should have raived the question as to whether
Messra. Robert Veitch \& Mesars. Robert Veitch \& Son or Mesars. Sutton \& Sons have the prior claim to the name of thin Bean, and then left it to other to decide. However, there need be no difficulty in the matter, for the official receipt of the Royal Horticultural Society granted to Mr. Ward in 1885 eatablishev, beyond quee-
tion, precedence in favour of his Bean-nom in the hands of Mears. Veitch. At Memur, wick Report until 1891, there is a Prionit in favour of the Exeter Bean of six years. It caty not matter one jot to the committee, as a whole, to whom shall be awarded the right of naming by virtoe of priority, but it does matter in the interents of transactions. As there is to be a large gathering of vegetable growers at Chiswick on September of perhape that would be a suitable occation on whind to set at rest the question at issue, for then, $m$. bably, there may be a fuller meeting of the wh. mittee. $H$. $E$.

PRIVATE GARDENS AND GARDENERB vom CHIsWICK. - With the temperate remarks of joor leader, p. 244, on Mr. Barron's retirement, no one can find fault, for if a wrong has been done, it thould be righted; but a much cannot be said of the closing paragraphe of the leader on p. 234, where comparisons are instituted between Chiswick and private gaidens that cannot tend to promote that sympathy from the craft that the writer claimu for the cause he pleads; while his ignorance of the duties of gardeners in private places shown that he, at least, is no jadge. I gather from his remarh that the only things about which gardeners in private places are able to form an intelligent opinion about are " auch elementary matters as digging, mowing. tree-nailing, and pruning, and the like matters; while the things they know nothing about, but which it appears handicaps Chiswick, are the loss of time attending meetings, the labour of noting trials, gathering and packing fruits, flowern, und plants, conducting visitore ruand, \&c., for all of which the superintendent has "nothing to shom." This will amase gardeners in places of any pretensions, where a large establishment is never off their shoulders from January to December, who have to grow and pack fruits, flowers, and vegetablen almont daily with ecrapalous care (having cooke and confectioners as well as employers to study inatead of only "Fellows"), and send to London and to ahooting. lodgen or wherever their employer happen to go-who at home have daily to set aside men to serve the houe with the same, not to mention the laborious ice supply by half-tona at a time, nor the large portion of esch day the men are taken off to fill vanes and dining-rooms with cat flowers and plants, watering them, \&c., before a stroke can be done in the garden proper in work involving forenight, akill, taste, and judgment. In addition to these, throw in school, and a charch or two, an agent's garden and vinery, half-a-dozen lodge gardens, and everal gardent of employer's friends, absorbing annually some thousands of plants, involving lista and correspondence on almont every horticultaral topic, and you have some idea, and no exaggerated one, of work in private gardens for which there is nothing to nhow. We expect, a a matter of course, rivitors by the handred, and often at a time rendervouiag in the grounds, bazarar for charitable objects mono polising the staff's time, cricket grounds, tennil courte, and the fire-brigade drilled half a day evory two weekt, which are nothing. No! the ples on thin head for any society' garden had better be absindoned, because it is trash, and it is a pertinent question, if the plea even bad any force, why gardeners from private places bave uxally been appointod Mc Chiswick, and why men like Thompm Mothing, and other succeeded so well perforim nothing about the work most gardener" perimen they carry on withont fee or reward, the facts they are continually recording in the Gard. Chrom, and elsowhere, and their record in the snnain of horticalture generally, where comparisons wond be dangerous. Some of your correspo widol are inconsistent. 1 any nothing about the circtimof employing private gardeners under present cand that Chiswick is chiefly devoted to growing fruit, market, and to testing vegetablep, fruith, and for private gardens, the choice in such a case certainly be limited to gardeners or market deners, or both. You are right in sta
your note appended to my letter last that I note appended to my letter perhaps, not sware how the has been spent at Chiswick, but I know how a pound will go in a garden, and renvation repairs mentioned-a very liberal annual allom -and which would leave about management, fnel, and andrier, \&c, -an allonil

Which I hava never lnown to be granted in the best gardene, ezcept, periaps, where the hot-houses and early forcing weremach greater than usual, and the fael bill high; and'ez_riry'dill, I feel are, prove as
which at present centres in this part of the Arctic regions, the realta, especially as to the movement of the ice, are of mach importance. Erom the account which has been forwardea to the lioyal

much. Experimentsl work is neither more expensive nor more haraning than private gardening, to tay. the leaxt. Head.

## NOVAYA ZEMLYA.

An expeditioc, cieanived by Mr. H. J. Peareon, left England ia the end of May with the intention of visiting Novaya Zomlya In view of the interent

Geographical Society, we learn that the member of the party were Mr. H. J. Pearson, Mr. C. E. Pearson, the Rev. H. H. Slater, and Colonel Feilder. Leaving Vardö in the steam yacht Saxon on Jane 14, a conrme was laid for Namelen Bay, in the uorth-wens of Novaya Zerolya. The ice conditiona in Barentu Sea were found to be extremely unfavournble. Impenetrable pack wan met with about 80 mile from the
weat coast of Novaya Zemlya, trending towards the north-went, and several day were apent in cruising along the edge of the heavy ice to the southeast. Every likely bight in the pack was entered, and in tom casen these indentations were followed for 20 to 30 milen, but invariably heavy polar ice barred the way, and the yacht had to seturn to open water. Cual ranning short, the vesel bore up for Vardö to refill. The member of the expedition were landed on the Marman coast of Rassian Lapland, near Sviatoi Nos, where they went into camp. A week was epent there proftably in ornithological, botanical, and geological investigations. Oa the return of the yacht from Vardü, a second attempt was made to reach Novaya Zemlya. The pack was again met with in about the mome meridian aa before, but, a fortunate lead whowing, the vessel ran some 40 milen through the pack, and found a apace of open water about the centre of Goose Land. Lafortunately, a dense, impenetrablo pack of 8 to 10 milen in width was jammed against the shore, and this formed a connection with the main pack off North and South Goone Capea ; in fact, the vensel lay in a large water-hole. An attempt was made to press the yacht towards North Goose Cape, in the hope of open water being found in the direction of Möller Bay, which resulted in the little vessel being nearly beet in the pack; but eventaally the large pool of open water off Goose Land was regained. The wind now shifted to the mouth-east, and the lead by which the yacht had entered closed entirely. The pack came ap from the direction of Mezhdusharnky Island, and hoar by hour the water-pool contracted. Again coal had begon to run thort, when, fortunately, a gocd lead opened to the south-west; a run was made for it, and, after passing through forty miles of dense pack on either side, open water was reached, the yacht ranning down to the island of Kolguev, with the ice in sight all the way on her port side. A landing was effected on Kolguev on July 5, and the members of the expedition went into camp near the mouth of the Kriva river, on the mouth-west side of Kolguev. The Saron retarned from Vardö and took the party off on July 16. Good renulte were obtained in Kolguev in various branches of natural hintory, and a aeries of intereatiog photographe were taken. During the atay of the party in Kolguev the weather was very bad, the tempersture seldom rising above $35^{\circ}$ Fahro, with fogs and bitter cold wind from north and north-west; part of the time the pack came down and girdled the weat side of the inland. Kolguev was left on July 16, and a third attempt was made to reach Novaya Zemlya. A marvellous change bad occurred in the conditions of the ice. The impenetrable pack which a fortnight previounly atretched from Kolguer to Novaya Zemlya had altogether dinappeared, and the Saxon reached Koatin Shar on the evening of July 17, without encountering a piece of ice worth mentioning. Stoppagen of some day were made at several anchorages in Koutin Shar, notably in Nekhvatova Bay, the final anchorage being at the head of Bielunha Bay, near South Goose Cape. The Samoyed aettlement in that locality war vinited. A considerable river which enters the north-eant of Bielusha Bay, wes explored. The Saxon returned to Vardio on Jaly 30, and to England on Aagunt 12, after an interenting and adventarou voyage. Times,

## D ISA KEWENSIS× - (UNIFLORA $\times$ TRIPETALOIDES).

Ook illestration (3g. 51) repreacate Dis Kewensia $X$, the first of the pretty bybrid Disa raised in the Royal Gardens, Kew, and which annually make there one of the mont beautiful diaplays made by any of the member of the Orchid family. The culture of these plant appeara to bave attained perfection at Kew, and the fact that the plant here repreanted flowered there in eighteen month after the seed were sown, is ample proof of it. As will be seen, the plant in mont floriferous. The flowers are bright rosy-crimson, with amall parple spoti on the galea: and also, enpecially in the mature flower, often aimilar potting on the other sepsis.

## SOCIETIES.

## ROYAL HORTICULTURAL OF ABERDEENS

Avaust 22, 23. 24.-Tnanks to the generonity of the Aberdeen Town Council, the Royal Horticultural Society of Aberdeen were able this year to give a very fine display in Dathie Park. In point of numbers the exhibite were auperior to anything previously got together. The total entries amounted to 2021 as compared with 1375 -in fact, 650 more patries than at any previous show. The varions sectional diaplays were laid ont in large marquees.

## Fruit and Vegetable

The number of exhibits in those clasees was far greater than entered last year. The entries in the fruit section were more than tripled-392 as againat 129. The exhibits were very meritorious, especially in the sections devoted to Grapes and Gooseberries. Owing to the time of jear, that lavourite berry in Abendoenshire-the Strewberry-did not occupy the prominent place it usnaly fills in local shows. The Grapen were very fine, and Mr. W. Hutchisson, Balmedie, Mr. G. DUNCAN, Arbroath, and Mr. A. BEID Darris, are to be congratulated on the excellent apecimens they sent forward. Currants and Apples were good, but there was nothing remarked of excoeding merit. Vegetables were excellent in all classes. Mr. George Milne, gr. to Lady Gordon Cathcart, Cluay Castle, took the blue riband in this division with a magnificent basket of vegetables; Mr. Johi Dalaцrno, Pitgaveay. Ellon; and Mr. Thomas MidDLETON, gr. Monymusk House, being 2ad and 3rd respectively. In the same competition for market gardeners, Mr. A. Paterson, Ruthrieston, Aberdeen, was lat. In the other mections of this division, Mr. Berd, Urie Houke. Stonehaven; Mr. Johi Dalgarno, Elgin; Mr. John Davidson, Outseate, Pitmurton; and Mr. Alex. Grigor, Fairfield, gave a good rcount of themselves. The amateurs and working-classes whowed very tair products in this division.

## Pot Praxts and Cut Flowers.

These divisions constituted the prettiest items, and considering the backwardness of the season, were splendid. The sections for stove or creenhouse plants were woll filled, the entries being 288 againat 158 last year; cut flowers 620 against 583. Among profemionals, Mr. John Proctor, ©r. to Bir Wrimiax Hewdensox, Devanha Howe, Aberdeen, took the premier place for a group of plants (Orchids excluded) arranged for effect on the ground in a circle of 10 foet diameter, defeating many competitors. Mr. Reid, Durris; Mr. Joer Duthee, Trinity Cemetery: and Mr. Kennidy, Wallfeld, followed in same order.
Orchid were well represented, Mr. Join Proctor, Devanha, and Mr. Grigor, Fairfiald, taking the chief prizes. Such a display of Ferns has not been seen for a long time, those specimens sent by Mr. A. Grigor, Mr. Proctor, and Mr. Gillespie, Aberdeen, being much admired. Mr. Proctor, it may also be mentioned, carried chief honours for the best eight stove or greenhouse plants, for the best group of plante, for Orchids, and for four Ferns from the gove or greenhouse, dissimilar. Mr. Robb, gr. to Mr. Murbat, Glenburnie Parl, Aberdeen, was lat for Pelargoniuma and Begonias; and Mr. Strachan, gr. to Mr. Jorn WMre, Beechgrove, Aberdeen, received similar honours for his display of Fuchsias. The amateurs and working classes also showed well here. The cut flowers were a capital show.
Mr. Reng the prize-takers were Mr. A. Grigor, for Orchids; Mr. Reid, Urie House, fur ladies' prays; Mesers. T. Maver \& Sov, Aberdeen, for wreaths and erones Mr. Joha Fisser, gr. to Mr. CoUPER, Graigiabuckler, for the beat twanty four H.P. Roses, and Tea Roses Mr. Rerm, Uric Howse, for twelve H.P. Roses, disoimilar; and Mr. Jork Fixsor, Montroee, for the best twelve Dahliam.
A monaf nurserymen, the Roses, so ural, pave rise to reen Aberdeen, and the Mewo eminent firma, the Mewars. Cocress, the Dwodee men went the local firin to the right-about; but for
 play in this aection beigg vary beantiful. Among the other nanes of A. Wistlind, Banchory; Miver \& Soned the deen; Alex. Grees, Aberdeen; and Mr. Robert Burws, aberdeen.
A feature of the show was the displays sent for exbibition by Mesers. BEN. REID \& Co., $\Delta$ berdeen; Messis. W. SMith \& Son, Aberdeen; and Mr. Jozir Fobbes, Hawick. which was much admired by the viaitors; while Messrs. SMITH \& Aow and Mr. Eombes in their display did equally well.

## BRIGHTON AND SUSSEX HORTICULTURAL.

Avadst 57 and 28 - A very fine exbibition and Susex Horticultaral and Motan the Brighton Astociation, on the occmaion of the foprovement exhibition, under the new management dome, and the apacion Corn Exchange Tadjoininge
were flled with exhibits, and. in addition, two spacious marqueen were arected on the lawn, and they were quite full. Mr. Rapert Miller, the Ausintant Secretary, was, as usual, very active, and the ataging committee got through their work in good time, and the judging commenced at an early hoar.
Groups.-There were three exhibitore in the class for a group of plants arranged for effect, to fill a spsce not exceeding 150 square feet. The beat was from Mr. Gro. Miles, Victoria Nursery, Brighton; it was singularly light and gracoful. Mr. H. J. Jowes, Ryecroft Nursery, Lewisham, was
2ad, with \& very imposing group, composed of Hegonias of exoellent quality, admirably arranged with Ferns and foliage of Asparagus plumosus.
Tha next class was for a miscellaneous group, occupying 80 feet. This was won by Mr. E. Meachen, gro to Mrs. ArmgTroNG, Willea, surronnded by plants asually found in groups of this vilea, surroanded by plants asually found in groups of this character. Mr. G. sians, Rt. to 2nd.
Groups of Ferns were delightful, the bent came from Mr. J. Adams, gro to the Rev. Sir C. Shiffern, Bt., Combe Place, Lewes, a masterpiece of effective grouping; some finely coloured examples of Adiantum, A. Farleyense being used with minor Ferns. Mr. G. Miles, Victoria Nureery, was 2nd. This is a class other societies might copy with advantage.

## Plants.

Mr. A. Offer, gro to J. Warbry, Ksq, Handcross Park, Crawley, was lst for six stove and greenhouse Ferns. with fine examples of Davallia polyantha, D. Mooreana. Cibotium Schiedei, Dicksonia antarctica, Adiantum cardrochlena, and a gra id piece of Microlepia hirta crista!a. Messrs. W. Miles \& Co., West Brighton Narsery, were 2nd.
The best apecimen flowering plant was Stephanotis floribunda frcm Mr. G. Fenvell, gr. to K. Cazalet, Eaq., Fairlawn, Tunbridge Wells.
Tables of flowering and foliage plants, 8 feet by 4 feet, were very effective, eight of them being placed under the dome. Mr. J. Turner, gr. to Sir Greville Smith, Wick Hall, was lot with a very graceful arrangement; and Mr. G. Miles, 2nd.
Tables of Begonius, 4 feet square, were also very effective, several of them finding a place in the Corn Exchange. The let prize went to Mr. F. Fairs, gr. to R. Clowes, Eeq., Clayton Wickham, Hassocks ; Mr. W. Hesd, The Dive Nursery, Hortham, was 2nd.
Here wore the colloctions of eight stove and greenhouse plants. Mr. E. Meacres whs placed lat with a fine piece of Latania borbonica, grand examples of Crotons Queen Victoria and Prince Waldeck, Anthurium orystallinum, Bougainvillea glabra, Allamanda Hendersoni, Statice fimbriata Gilberti, and Ivora javanicum. Mr. OfFER was 2nd.
Groups of sir Crotons were represented by small but finelygrown and brilliant-coloured apecimens; Fachsias and zonal Pelargoniums by nice examples of moferate size.
The best six Orchids came from Mr. G. Duncan, gr. to C. J. Lucas, Req., Warnham Court, Horsham, who had Dendrobium formosum giganteum, Cattleya Dowiana, C. Mossise, Odontoglowoms Wilclreanum and Alexandres, and Oncidium Fabea Mr. R. Garnet, gr. to R. G. Fletcher, Req., Mount Harty. Prestoa Park, was 2nd. Such foliage plants as Palmos, Coleus in the form of well-grown and coloured specimens, exotic and British Ferns, the former small but admirably grown; and table plants were all well shown.
Cut $f$ lowers were a great feature, the Cactus Dahlias in particular commanding general praise. The leading classes occupied a commanding position on the platform ander the dome, but the light was bad and the judging difficult. Bores of cat st, ve and greenhouse flowers were very attractive; the winner of the lst prize for twenty-four buaches had large and impoeing bunches, though set up in a somewhat formal manner. Bores of twelve varieties were also good. Messrs. Pririnss \& Son, nurserymen, Coventry, had the beat twentyfour Roser, among theth a magniticent bloom of Black Prince, which they appear to grow in the finest condition; but though it was sent out some twelve years aqo, it is rarely seen. Mr. T. W. ToUnG, Rowe-grower, Eastbourne, wae 2nd; some good blooms being shown by both exhibitore.
With twelve Rowes, Mr. K. Harry, gr, to Mre Evensyikid, Dense Park, Horham, was 1at; and Mr. Iawrence, gr. to T. West, Eeq., Tanbridge, Horshama, 2ad.

With twelve Teas, Mr. G. W. PIPERB, nursergman, Uckield, was 1st; and Mr. H. Harri 2nd, some very good blooms boing staged.
Spikes of Gladioli were in good condition, the individuale in the ist prize twelve of good length, clean, fresh, and the
quality excellent. uality excellent.
The best fortyeight Dahlias came from Mr. S. Mortimer, Swise Nursery, Farnham; Mr. F.W. Seale, nurseryman, Sevenoaks, was 2nd.
With twenty-four Dahliag, Menmer. J. Cheal \& Soxs, Low\& Sows, 2nd. Crawley, were lot; and Mests. Pericixs \& Sons, 3nd.
For twelve blooms, the lot prize went to Mr. J. Stredwice, Silver Hill, St. Leonards: Mr. J. D\&Wsom, of the same addrem, being 2nd. Pompon Dahliaa in twelve banches, each of ten blooms, were very fine, and the same with six bunches.
Bunches of siogle Dahlias in 24's, ten blooms in a bunch, were very striking. Mr. F. W. Seale was lat, and Meemrs. them, but we thought the latter hat litie to choose between them, but we thought the latter had erred nomewhat on the side of size.

Cactus Dahlias wore very numerous. Mr. Seale we ht with twelve bunches. Delicsta, Matchless, Lady Penzam, and other popular varieties being in their best form. Mr. \% Mortimer was 2nd. For sir varieties also, there was a ket competition; and Messrs. J. CHeal \&ov's special prizatoe nine bunches, three of each, was numerously contested.
Collections of herbaceous or bulbous flowers brought sime fine contributions. Mr. W. Mantos, gr. to Mrs. Clifrone Borer, Pickwell, Boling, was 1st with fresh examples is gool condition; Mr. G. H, Sage, The Gardens, Ham Howe
Surrey, being 2nd. With twelve bunches, Mr. F. W. Sraur Surrey, being 2nd. With twelve bunches, Mr. F. W. Seus Preston Park, 2nd. Collections of twelve bunches of aumb Zinnias, Asters. quilled and flat-petalled, were also show.
In the way of floral dacorations, Messrs. S. Perkins \& bos took the 1st prize with one bride'd and one ball-room buaqu, done in their usual excellent style; Mears. Scrivemed \&Co.,
Floral Hall, Watford, came 2nd. Wreaths or a device were Floral Hall,
also shown.
There was a cunsiderable number of centre-pieces, with natural flowers and foliage. Mis. Jounson, Seldenvily Worthing, set up a charming light arrangemeat composed of light grasees and Ferns, and pink and heliotrope-tinted swut Peas; Miss L. Hudson, Gunnersbury House, Acton, came and.

## Fruit.

Of fruit there was a remarkable display, perhaps one of the best seen in Brighton in late years. There were sereral calt lections of eight dishes. Mr. Gore, florist, Polegate, wats lof with finely finished Gros Maroc and Muscat of Alexandris Grapes, Barrington Peaches, an unamed Nectarine, and Bom Chyétien Pears, Moor Parly Figs, and one other; 2nd, Mr. W. Taylor, gr. to C. Biyor, Esq., Tewkesbury Lodge, Fant Hill.
The best three buaches of Black Hambargh Grapes came from Mr. T. M. Le Pelley, Valley Vineries, Kusper, very fine indeed. The best three bunches of any other black Gripe wore Gros Maroc, very finely fiaished, frum Mr. T. Ambroes, gr. to E. Blenikiron, Esq., The Farm, Broadheath. The bett three bunches of white Grapes were superbly-finished Musat of Alezandria from Mr. W. Tidy. Grapes were also shown as ingle buEches.
Melons were plontifully shown, and the tasting process must have been a tedious one. The two best diehes of Peaches were Dymond and Bellegarde, from Mr. G. Goldsmith, gr. to W. I. Hubbard, kaq., Leonardslee, Horsham ; Mт. H. Harris, gr. to Mrs. EVERsfieLd, being 2nd. Mr. Goldsmith had the beat two dishes of Nectarines in Elruge and Pine-apple. Mr. Cole, gr. to H. F. Walker, Eeq., Balcombe, was and with Pricee of Wales and Downton. Pears, both dessert and stewing, were very good.
Apples wese in grand form, there were many entries for four dishes of culinary varieties, Mr. Will Tayzor, was let with surerb fruite of Ecklinville, Lord auffield, The Quees, and Warner's King.
Mr. Martir had the best four dishes of deacert applen staging Aatrachan, Worcester Pearmain, Queen, and Irinh Peach.
Single dishes were also shown in plenty; also plamen Cherries, Figs, \&c.
Among vegetables, Potatos were numerous, and cullecticn decidedly good.
Miscellaneous Collections.-A very fine group of Lilies and other plants, also a muperb collection of Appl
Messrs. Balchin \& Sons, Hassocks Nureeries.
From Measrs. Veitch \& Sons, Cheleea, came one of the features of the show-a very fine group of Pitcher Plante, \&ce, and some beautiful Streptocarpus from seed sown in Janary last. A Gold Medal was a warded.
Mr. J. Charlton, Tubbridge Wells, had a collection of Dahlias, \&c.; and Mr. Will Taylor some cut Roses.

## BATH

Auaust 28.-The Bath Fioral Fête and Band Committee were fortunate in having fine weather for the bolding of their annual show in the Sydaty Gardens on Wednesday. The show, on the whole, compared favourably with ita predecessors, and mali credit is due to the Hon. Secs., Mesar. R. F. Pearton and W. Jeffery, for the excellent arrangementa mado noder their anperviaion in the varions aectiont of the show for the staging of exhibits.

Fuchsias are al ways gints. class for nine plants in as many varieties, there were only two lots put up, thees being really grand plants in every senae they were about $9 \frac{1}{4}$ feet high, $4 \frac{1}{3}$ feet through at the base and well furnished from bottom to top with healthy folisge, grandly flowered, the varieties represented being Charmus, Bountifnl, Doel's Favourite, Final (darks); Arabella, Lustir Improved, Margareta, Barriett Lye, and Mre. Rundel (light) Mr. George Tucker, gr. to Major Olab
with the above; Mr. Marsi was 2nd. In the class for six plante in six varieties, two Market Laring up. Mr. James Lye, gr. to Hon. Mrs. Har, Market Lousins
ton, Wilts, wres a good let; Mr, Snell, gr. to Mre. Cousin ton, Wilts, was a good let; Mr. Anell, Gr. to Mrr. Cousant
Weston, was a good 2nd. In the clase for twelve ornmmental foliage plants, sirs stored and six greenhouse, Mr. Cypirer whe easily list, and shomm well. Mr. CypHer was who lat in the clase for Mne apst. aso. foliage plant, with a fine Croton Chelooni, Mast. Mp. Crp sons had the bett specimen of Linum antilliter Mp. CyPHER had the bent eight plants of ornamental folismm

Qusen Victoria，Mortfontainensis，\＆e．Tha same skilful grower took chief honours for six Eeaths；Mr．TUCK Eis being a creditable 2nd．The last－mentioned exhibitor secured lat for apecimen flowering greenhouse plant，with a good Statice profuse；Mr．CyPEER taking a like honour for a specimen stove flowering－p＇ant，with Irora Duffii．
Mr．H．Pocock，Trowbridge，was lst for three atove plast，distinct．showing a very finely－flowered Ixora Wil－ liamsii，I．coccinea，and Lapageria asba．Mr．Cry shating the best siz stove and greenhouse fowering plants，showing． among others，Bougainvillea，Sanderi，Clerodendron Bal－ louriana，

Coleus were well shown by Mr．Dexton and Mr．C．Gbrb Low，the plante，flat－trained，being highly coloured．
For twelve exotic Ferns，Mr．Tucker was lat，with an even fred lot of plants，including excellent plants of Davallia hemi－ ptern，Adiantum gracillimum，and Dicksonia antarctica；Mr． Pocock，was 2ad．Mr．Baily，Frome，had the best six plants Pocock，was ading good－sized Davallia Mooreans，and Adiantum Farley－ includis Mr．H．Holures had the best specimen Fern in s fine ense．Mr．J．Hilia polyantha（D．divaricata）．
Groups arranged for effect，on a space not less than 100 Groups arradged lor effect，fou competitors．The con－ equare feet，were shown by four competitors．The con－
test lay between Mr．CxpHer，Cheltenham，and Mr． test lay between Mr．Cxpiek，Cheltenham，and Mr． Choice Orchids of suitable varieties and size told well in Mr． Cypher＇s srrangement，which was placed 1st．

Cut Flowers．
The clases devoted to cut flowers were were filled．Mr． Baird，gr．to F．H．Fox，Esq．，Wellington，was lat for thirty－ Baird，gr，to F．H．Fox，showing a fine lot；Mr．HuLc was six Mr．SAMUEL ToTTLE，Taunton St．James，was lat for 2nd．Mr．8amuel Totile，Taunton st．James，
Mr．George Humphrirs，Chippenham，had the best twenty． our show varieties of Dahlias with a solid，fresh－looking lot of blooms．
Mr．Thomas Hawrins，Soundwell，was 1st for twolve blooms；Mesary．J．Grat \＆Sons，Frome，being 2nd．The last－named ezhibitors took 1st for nine blooms，and Mesar Kexnes，Wilhuws \＆Co．，Salisbury，were placed 2nd．
In the clase for aingle Dahlias，shown in bunches，Mr． Thos．Truckle，gr．to THomas OAki，Esq．，Tiverton，was 1st， with a good exhibit．
Roes made a line show．Mr．George Prixce，Oxford，was lat for twenty－four single blooms，distinct，showing a grand lot for the time of year，including Louis Van Houtte， Reynolds Hole，Hon．Edith Giffard，and Duke of Edinburgh Mr．Srephes Treseder，Cardiff，was a creditable 2nd．Mr Hosps，Bristol，had the best twelve blooms，in vingle trusses and Dr．Budd，Bath，was lat for twelve Teas，with excellent blooms．
Owetas Dahliae were well exhibited by Menme Kryans． Wrutiams \＆Co．s Salimbury，and were much admired．

## Frcit．

On the whole this made a good display，though in the class for a collection of twelve dishes only one lot was staged，viz． that from Mr．Nash，gr．to the Duke of BeauFort，Badminton， Chippenham，who was justly awarded the lat prize．
The chief class for Grapes was one for eight bunches in four Farieties，and only three lots were put up in compotition． Mr．Gibson，gr．to Earl Cowher，Draycote House，Chippenham， wat lat；and Mr．S．Hodgee，gr．to JıMEs Fosiri，Esq．Bath， 2ad．The lst prize collection contained grand bunches of Groe Maroc，Black Hamburgh，fine in berry and colour Buckland Maroc，Black Hamburgh，fine in berry and comples of Madres－ Sweetwater
field Cuurt． There were twelve stands of three buaches of Black Eam－
burgh．Miss Marniott，Bath，was an easy ist，showing speci－ burgh．Miss MarniotT，Bath，was an easy lat，foowing speci Gibson was 2nd．
Three stands of two bunches of Mascat of Alexandria were otaged，and Mr．W．Carpentier，gr．to A．R．BaILET，Eqq． Prome，was wall let，as he aleo was for any other white．
Mr．Nisy was good lat in any other black clas，with Mr．NAsH waingood bunches of Black Alionate，fiae in ahape and berry．
Melons were fairly well represente 1．Twenty－one iruits of red Melons were airiy well Mr．Joses was lst for a green and green kinds were shown．Mr．W．Straguell，pr．to the flesh，with Hero of Lockinge．Mr．W．Struguel，gr．had the Right Hon．W．H．Lova，Rood Ashton，Trow
best scarlet－fleeh in Carter＇s Blenheim Orange．$\quad$ Peaches were not extensively show．Mr．Pgme，gr．to Mrs．Golvamith．Trowbridge，had the best dish of nine，with good even fruite ；and Mr．Cabpenter had the best vix．
Ifectariaes were well represented．Mr．John Wright，gr． to E．C．Wriss，Feq．Kelstons Knoll，Bath，had the best aine，showing extre fine fruits of stanwick Elruge；Mr． Coombe，gr．to J．W．LaxGDOX，Esq．．Freshyy，was 2nd．
Plums were largely shown，and on the whole the quality and arze of the fruits were good．

Of Cherrie，there were niae good dishes put up，Mr．Jonns taking the premier position with very fine Morellos．
Pears were plentifully shown．Mr，J．Gresos wae a good Ist；and Mr．Wilkins，gr，to Lady Theodora GUEst，In－ wood，Henstridge，was 2nd．
Apple made a foe display，agood length of staging boing devoied to them．Mr．E．D．Bourdillion，Wells，had the beet three dibles of domert virietien；Mr．G．Garawar．Fath， tariog and place．
Vrgetables were well represented．Mr．Copp，Sherborn， was lst for Mears．Webb＇s special prize for tix kinds，and for Sewrs．Sutton \＆Son＇s prizs for a similar collection．Mr． Winkras was let for the Society＇s clase for twelve kinde，and Whe quality of his produce was very good．

Non－competitive Exhibits．－Mesors．GEO．BUNY\＆RD \＆CO． Maidstone，had a collection of fifty varieties of Apples，the fruits being of fine size，clean，even，and many of them besutifally coloured．Mesara．Geo．Coolinu \＆Sons also Lad a good collection of Apples and Pears．

## SANDY EORTICULTURAL

Auadst 29．－The Sandy show was held on the above date，and financially，an well as in other rempects，the result was a very favonrable one．Hor ticulture form but a mecion of this exhibition where there are classen for doge，cats，poultry，cage birds，pigeons，and other apecialties．However，the horticaltaral part of the schedule included clasees for plante，fruit，vegetables，and market garden produce，and a good exhibition was made of these．
In the operi classes for planto，Mr．J．CypHerb，Chelten ham，well won lst place for ten stove and greenhouse plants in flower；and Mr．W．Fince，Coventry，also nhowed credit． ably．The best group of plants arranged for effect was the exhibit from Mr．W．Vause，Leamington；and he was followed by Mra．Astell，Woodbury Hall．Mr．W．J．Empson had th best six plants suitable for table decoration．
In classes excluded from the competition of nurserymen， Mr．W．J．Empson took lst place for four foliage plants， distinct；and Mrs．Astikl was 1st for sir and aneenhous Forns． Other clases for plants in the open section，also for amateurs and cottagers，were very nume
display of commendable quality was made．
display of commendable quality was made． kinds of fruit，Pines excluded，was won by Mr．G．B．Allis． gr．to Major 今HUTTL EWonte，Old Warden Park，Biggleswade， and the collection of wix kinds by Mr．W．J．EMpson．Both these exhibitors also，figured largely among the winners in other fruit classee．

Vegetables and cut flowers were considerable features，and altogether the exhibition was large．

## SOCIETIES.

## ROYAL HORTIOULTURAL OF ABERDEEN.

August 22, 23.24.-Taanks to the generonity of the Aberdeen Town Council, the Royal Horticultural Society of Aberdeen were able this year to give a very fine diaplay in Dathie Park. In point of namber the exhibite were auperior to anything previoasly got together. The total entrie amounted to 2021 an compared with 1375 -in fact, 650 more patries than at any previous show. The various ectional displays were laid out in large marquees.

Fruit and Vegetabley,
The number of exhibits in these claseses was far greator than entered luct year. The entries in the fruit section were more than tripled-392 against 129. The exhibits were very meritorious, especially in the aections devoted to Grapes and Gooseberries. Owing to the time of year, that favourite berry in Aberdeenahire-the 8trawberry-did not ocoupy the prominent place it man ly fille in local shows The Grapes were very fine, and Mr. W. Hutciinson Balmedie, Mr. G. Duwcax, Arbroath, and Mr. A. RELD Durris, are to be congratulated on the excellent specimens they sent forward. Currants and Apples were good, but there was nothing remarked of exceeding merit. Vegetables were excellent in all clasees. Mr. Georgo Milne, gr. to Lady Gordon Cathcart, Cluny Castle, took the blue riband in this division with a magnificent bagket of vegetables; Mr. Johir Dalaıbno, Pitgaveny, Ellon; and Mr. Thomas MidDLETON, cr., Monymusk House, being 2nd and 3rd respecively. In the same competition for market gardeners, Mr. A. PATERSON, Ruthrieaton Aberdeen, was lat. In the ther mections of this division, Mr. Rerio, Urie House, Stonehaven; Mr. Joien Dalgarno, Elgin; Mr. Jorn Davidson, Outgeats, Pitmuxton; and Mr. Alex. Grigor, Fairfield, gave a good account of themselves. The amateurs and working-classes ahowed very fair prodacts in this division.

## Pot Playts and Cut Flowers.

These diviaions constitated the prettiest items, and considering the backwardnes of the season, were splendid. The seotions for stove or greenhouse plants were well filled, the entries being 282 against 156 last year; cut flowers 620 against Wiwhuang profomionals, Mr. John Proctor, gr. to 8ir premiar place for as group of plants, (Orehids, tools the arranged for effect on the ground in a circle of 10 feet arragged 0 er effect on the ground in a circle of 10 feet
diameter, defeating many competitors. Mr. Reid. Durris; diameter, defeating many competitors. Mr. Reid, Durris; Mr. Johr Duthie, Trinity Comet
Wallfield, followed in same order.
Orchids were well represented, Mr. JoHv Proctor, Devanha, and Mr. Grigor, Fairfeld, taking the chief prizes. Such a display of Ferps has not been seen for a long time those specimens sent by Mr. A. Grigor, Mr. Proctor, and Mr. Gillespie, Abardeen, being much admired. Mf. Proctor, it may also be mentioned, carried chief honour. for the best eight stove or greenhouse plants, for the beat group of plants, for Orchids, and for four Ferns from the tove of greenhouse, dissimilar. Mr. Robb, gr. to Mr. Muriay, Glenburnie Part, Aberdeed, was list for Pelargoniams and Begonias; and Mr. Strachan, gr. to Mr. JoHN FYFR, Beachgrove, Aberdeen, recoived similar honours for his dieplay of Fuchsias. The amateurs and working clacses also showed well here. The cut flowers were a capital show.
Avang the prize-takers were Mr. A. GRIGon, for Orchids Mr. Reid, Urie House, for ladies' sprays; Mesarn. T. Mavin Sox, Aberdean, for wreathe and arosees Mr. John Fiaser, gr. to Mr. COUPER, Graigiabackler, for the beet twanty- four H.P. Rones, and Tes Roses Mr. Rito, Uric Woase, for twelve H.P. Roses, disvimilar; and Mr. JoHy Wruon, Montrose, for the best twelve Dahliar.
Among nurserymen, the Roses, as asual, gave rise to hean livalry between thone two exainent firms, the Menara. Cocker Aberdven, aad the Mewrs. Oeorit. Duadee. For Tree Roses, the Duadter mean memt the local frra to the right-about ; but for Fi.P.'s, the politions were reversed, the Meburs, Cocken's dith play in this section being very beantiful. Arang the otho names deen. An. Westhand, Bunchory: Maver \& Son, Aber deen: Alex. Giles, Aberdeen; and Mr. Bobert Burws Aberdeen.
A fenture of the show was the displays sent for exbi bition by Mesars. Bev. Reid a Co., Aberdeen; Messis. W SMTH \& SoN, Aberdeen; and Mr. JoHi Fonbes, Hawick The Messra. REID Co. had a magnificent display, and one which was much admired by the vinitors; while Meare Smirit \& Son and Mr. Fonbes in their display did equally
well. ,

## BRIGRTOY AND SUSSEX HORTICULTURAL

Avaus 57 axv 28.-A very fine exhibition rewarded she effort of the committee of the Brighton
end Sanex Horticultural and Matsel Astociation, on the occaion Mutaal Improvement exhibition, nnder the new manam the fouth annual dome, and the apacions Cornagement. The huge
wars filled with exhibits, and in addition, two spacious marquees were orected on the lawn, snd they were quite full. Mr. Rapert Miller, the Assistant Secretary, was, as usual, very active, and the ataging committee got through their work in good time, and the jadging commenced at an early boar.
Groups.-There were three exhibitors in the class for a group of plants arranged for effect, to fill a space not exceed ng 150 square feet The was from Mr, GEO. Miles, Victoria Nursery, Brighton; it was singularly light and graceful. Mr. H. J. Jones, Ryecroft Nursery, Lewisham, was 2ad, with a very imposing group, composed of Begonias of
exoellent quality, admirably arranged with Ferns and foliage exoellent quality, admirably arranged with Ferns and foliage of Asparagus plumosue.
Tha next olass was for a miscellaneous group, occupying 80 feet. This was won by Mr. E. Meachen, gro to Mrs. Armstrong, villea, surfounded by plants agually found in groups of this character. Mr. G. Sims, uf. to C. J. Iswood, Esq., Dyke charactor. Mr. G. sima, gr. to
Road, Brighton, was a very good Ind.
Groups of Ferns were delightiul, the best came from Mr. J $\Delta d a m s, g r$. to the Rev. Sir C. Shiffern, Bt., Combe Place Lewes, a masterpiece of effective grouping: some finely coloured examples of Adiantum, A. Farleyense being used with minor Forns. Mr. G. Miles, Victoria Nurtery, was 2nd This is a class other societies might copy with advantage.

## Plants.

Mr. A. Offer, gr. to J. WArrbx. Esq, Handcross Park, Crawley, was list for six stove and greenhouse Ferns. with fine examples of Davallia polyantha, D. Mooreana. Cibotium Schiedei, Dicksonia antarctica, Adiantum cardiochlæena, and a gra id piece of Microlepia hirta cristata. Messrs. W. Miles \& Co., West Brighton Nursery, were 2nd.
The best specimen flowering plant was Stephanotis floribuada frcm Mr. G. Fennell, gr. to K. Cazalet, Eoq., Fairlawn, Tunbridge Wells.
Tables of flowering and foliage plants, 8 feen by 4 feet, were very effective, eight of them being placed under the dome. Mr. J. Turner, gr. to Sir Greville Smyth, Wick Hall, was 1st with a very graceful arrangement; and Mr. G. Miles, 2nd.
Tables of Begonius, 4 feet equare, were also very effective, several of them finding a place in the Corn Exchangs. The let prize went to Mr. F. Fairs, gr. to R. Clowes, Eeq., Clayton Wickham, Habsocke; Mr. W. Head, The Dive Nursery, Horcham, was 2ad.
Here were the collections of eight atove and greenhouse plants. Mr. E. Mescriex wis placed lat with a fine piece of Latania borbonica, grand examples of Crotons Queen Victoria and Prince Waldeol, Anthurium crystallinum, Bougainvillea glabra, Allamanda Hendersoni, Statice fimbrista Gilberti, and Izora javanicum. Mr. OfFer was 2nd.
Groups of six Crotons were represented by small but finely grown and brilliant-coloured specimens; Fuchsias and ronal Pelargoniums by nice examples of moferate size.
The best six Orchids came from Mr. G. Duncan, gr. to C. J Lucas, Rsq., Warnham Court, Horsham, who had Dendrobium formosum giganteum, Cattleya Dowiana, C. Mossie, Odontoglosoms Wilekeanum and Alexandre, and Oncidium Fabes. Mr. R. Garnet, gr. to R. G. Fletcher, Req., Mount Eury, Preston Park, was 2nd. Such foliage plante as Palms, Colev, in the form of well-grown and coloured specimens, exotic and British Ferns, the former small but admirably grown; and table plants were all well shown
Cut 4 lowers were a great feature, the Cactus Dahlias in par ticular oommanding peneral praise. The leading clases occupied a commanding position on the platform under the dome, but the light was bad and the judging difficult. Bores of cut ot. ve and greenhouse flowers were very attractive; the winner of the Jst prize for twenty-four bunches had large and imposing bunches, though set up in a somewhat forma manner. Bozes of twelve varieties were also good. Messrs. Prixins \& Son, nurserymen, Coventry, had the best twenty four Rojes, among them a magniftcent bloom of Black Prince four Rojes, among them a magnificent bloom of Black Prince,
which they appear to grow in the finent condition; but though $t$ was sont out some twelve years ago, it is rarely seen. Mr. T. W. Youkg, Rose-grower, Rastboums, wae 2nd; some good blooms being shown by both exhibttore.
With twelve Roees, Mr. H. Harry, gr, to Mr. Everspimad Deane Park, Horlham, was lot; and Mr. Lawrence, gr. to I. West, Req., Tanbridge, Horshan, 2nd

With twelve Tese, Mr. G. W. Prerin, nurseryman, Ucheneld was 18t; and Mr. H. Hanhy 2ad, womo very good bloom being staged.
Spikes of Gladioli were in good condition, the individual in the lat prize twelve of good length, clean, freah, and the uality excellent
The best forty-eight Dahlias came from Mr. S. Mortimer, Swiss Nursery. Farnham; Mr. F. W. Skule, aurseryman, Sevenoeks, was 2nd.
With twenty-four Dahlias, Meswrs. J. Cerehl do soss, Low field Nurserie, Crawley, were lat; and Meesrs. Perkin. \& Sons, 2nd.
For tweive blooms, the let prize went to Mr. J. Stredwics, Silver Hill, 8t. Leonands; Mr. J. DAWsos, of the smme addreen, being 2nd. Pompon Dahlias in twelve bunches, each of ten blooms, were very fine, and the same with sir bunches.
Bunches of siogle Dahlias in 24 's, ten blooms in a bunch, were very striking. Mr. F. W. Selle was let, and Measrs. them, but wis thos, 2md, with Vary little to choose between side of size. In the the latter had arred nomewhat on the side of size. In the olacs for bix bunches, thexe was no
competition.

Cactus Dahlias were very numerous. Mr. Seale was it with twelve bunches, Delicata, Matchless, Lady Peazara, and other popular varisties being in their best form. Mr. , Mortimer was 2nd. For sir varieties also, there wha heta competition; and Messrs. J. Cheal Eov's apecial prizo for iae bunches, three of each, was numerously contested. Collections of herbaceous or bulbous flowers brought name fine contributions. Mr. W. Mantos, gr. to Mrs. Chiphon Borer, Pickwell, Boling, was 1st with fresh example, in gool condition; Mx. G. H. Sage. The Gardens, Ham How, Surrey, being 2nd. With twelve bunches, Mr. F. W. Slate was 1st; and Mr. W. E. Anderson, gre to Mr. F. W. Suse Preston Park, 2nd. Collections of twelve bunches of auman Zinnias, Asters. quilled and flat-petalled, were also shom,
In the way of floral dacorations, Messrs. S. Perkirs \& 80 ook the lst prize with one bride's and one ball-room boaquen, done in their usual excellent atyle; Messys. Scrivenin $\mathrm{Ca}_{\mathrm{o}}$, Floral Hall, Watford, came 2nd. Wreaths or a device wes also shown.
There was a considerable number of centre-piecos. with astural flowers and foliage. Mrs. Jornson, Soldeavilo Worthing, sot up a charming light arrangement compoed of light grassea and Ferns, and pink and heliotrope-tinted swat Peas; Miss L. Hudson, Gunnersbury House, Acton, came 20d.

## ERUIT.

Of fruit there was a remarkable display, perhaps one of the best seen in Brighton in late years. There were sereal callections of eight dishes. Mr. GORE, florist, Polegate, was ist rith finely finished Gros Maroc and Muscat of Alezandris Grapes, Barrington Peaches, an unamed Nectarine, and Bom Chrétien Pears, Moor Parly Figs, and one other; 2nd, Mr. W. Taylor, Rr. to C. Bayor, Esq.. Towkesbury Lodge, Forat Hill.
The best three bunches of Black Hamburgh Grapes came from Mr. T. M. Le Pelley, Valley Vineries, Rusper, very fine indeed. The best three bunches of any other black Grape were Gros Maroc, very finely fiaished, frum Mr. T. Ambroen, gr. to E. Blienirinon, Esq., The Farm, Broadheath. The bent three bunches of white Grapes were suparbly-finished Muscat of Alexandria from Mr. W. Tidy. Grapes were also shom w single bunches.
Melons were plontifully shown, and the tasting process must have been a tedious onc. The two best dishes of Peaches were Dymond and Bellegarde, from Mr. G. Goldsmith, gr. to W. E. Hubbard, Esq., Leonardslee, Horsham; Mr, H. Harris. gr, to Mrs. Eversfiecd, being 2nd. Mr. Goldomith had the bett two dishes of Nectarines in Elrugeand Pine-apple. Mr. Colet gr. to H. F. Wilker, Eeq., Balcombe, was 2nd with Pribct of Wales and Downton. Pears, both dessert and stewing, were very good.
Apples wese in grand form, there were many entries for four dishes of culinary varieties, Mr. Whut Taylor, was lut with suqerb Iruits of Ecklinville, Lord buffield, The Queed, and Warner's King.
Mr. Martir had the beot four diehen of dessert Apples staging Astrachan, Worcoster Pearmain, Queen, and Jrith Peach.
Single dishen were alno shown in plenty; aloo liums, Cherries, Fige, Ece
Among vegetsbles, Rotatos wera numerous, and callectio decidedly good.

Miscellaneoue Collections.-A very fine group of Lities and other plants, slso superb collection of Apples, were from Messra. Balciris \& Sons, Hassocks Nurserics.
Messr. Balchin \& Sons, Hassocks Nurseries.
From Mesers, Vertcr
From Mesars. Veitch \& Sons, Chelsea, came one of the features of the show-a very fiae group of Pitcher Plants, den, and some beautiful Streptocarpus from seed sown in Janmary last. A Gold Medal was awarded.
Mr. J. CHarltor, Tunbridge Wells, had a collection of Dahlias, \&c.; and Mr. Will Taylor some cut Boess.

## BATH

Avadst 28.-The Bath Floral Fete and Band Committee were fortanate in having fiae weather for the bolding of their annual show in the Sydaef Gardens on Wednesday. The show, on the whole compared favourably with its predecensors, and much credit is due to the Hon. Seca., Meners. R. F. Pearron and W. Jeffery, for the excellent arrangements made ander their supervision in the varions sections of the ahow for the ataging of exhibit.

## Plints.

Fucheias are al way given precedence at this show. In the class for nine plants in as many varieties, there were only two lots put up, these being really grand plants in every soum they were about $9 /$ feet high, $4 \frac{1}{3}$ feet through at the bace, and well furnished from bottom to top with healthy foliage, grandly flowered, the varieties represented being Charming Bountiful, Dool's Farourite, Final (darks) ; Arabella, Jastire Improved, Margareta, Harriett Lye, and Mrs. Randel (Hg It Mr. George Tueler, gr, to Major Clarm
With the above; Mr. Marsir was 2nd. up. Mr. James Lye prate in six varieties, Market Latily
 ton, Wilts, was a good 1st
Weoton, was a good 2ad.
In the class for twolve ornamental foliage plants, six. stove and sir greenhouse, Mr. OyPEER was basily 1st, sud well. Mr. CYPHER was also let in the clase for one aped GSo. foliage plant, with a fine Croton Cheisoni. Messr.

Mr. OPPHER had the beat eight plants of ornamentarifilinm

## Gardencers Clironidle.

SATURDAT, SEPTEMBER 14, 1895.

## BUTESHIRE.

BUTESHIRE, with its ancient capital of B Rothesay," the acknowledged Queen of Scottish Watering and Wintering plaoes," oontains muoh to interest the hortioulturist. Rothesay, with its beantiful bay, forming a semiellipse $1 \frac{1}{2}$ mile across the mouth, is undoubtedly one of the finest and best sheltered bays on the west coast of Sootland. Five centuries ago its palace was built in front of its even then old oastle, and it had for its first visitors the Kings of Scotiand, who, during the summer months, and also sometimes daring the winter season, resorted to it for the parpose of enjoying its delightful climate, its translucent waters, and its beantiful sounery. There is no reoord of the building of the oastle, which still surfives in the square in the oeutre of the town. The first mention of it in history is in 1228. It must have passed through many vicissitudes in troublous times; it was seized by Cromwell's troops when they invaded Sootland, and on leaving it they destroyed a portion of the walls. It was subsequently taken by the Earl of Argyll in 1685, and afterwsrds burned by one of the Earl's brothers. For some time previous to that the castle had been ocoupied by the Marquis of Bute's ancestors, who, after the burning, and till the erection of Mount Stuart, his lordship'a Buteshire residenoe, five miles away, resided in a house in the High Street.

The meteorologist records that the range of the thermometer in Rothesay is about $18^{\circ}$ fewer than the average of Sootland, being $15^{\circ}$ warmer in winter, and $5^{\circ}$ cooler in summer. This is prinoipally caused by the faot that Bate consists of comparative low land, surrounded with seawater, which latter is a great deal warmer than the atmosphere in winter, and somewhat cooler in summer. The influence of the warm Galf Stream in winter is remarkably exemplified by the infrequency and mildness of frosts, the rarity of snowstorms, and the quickness with which snow melts when it does fall. Owing to the land being so little elevated, muoh less rain falls here than in the surrounding parts of Scotland, The high hills of Cowal, Ayrshire, and of Arran on every side break the rain clouds, the content of whioh, in many oases, are discharged on them whilst scarcely a drop falls in Bute. For the same reason, this favoured island haa singular immunity from thunderstorms-the thunderclouds being attracted or broken by the high hills surrounding it. The absence of fogs is remarkable-attributable, it is thought, to the Buteshire farms being well drained, and that there is no tendency for an excess of damp to remain in the land or in the atmosphere.

Pleasant walks abound about Rothesay, and throughout the island they form some of the chief attractions of the place. The Marquis of Bute has most liberally construoted paths
through the woods on the heights above the town, which form delightfully shaded and sheltered walks, affording oharming glimpses of the bay and surrounding hills. Here oome the townspeople in the evenings of week-days daring summer, and it is a favourite walk on the Sabbath evening after kirk. The English visitor is strack with the quiet peacefulness of the Sunday in Rothesay, no vehiole plying for hire on land, and no boat upon the sea. Every publio-house is olosed, and no element of discord is heard in the public streets. What would inoite to a revolution in London, is here acquiesced in, and more-appreoiated.
The horticultaral features of Rothesay are many and intereating. Various shrubs and plants, regarded as tender in colder parts, are hardy during the winter, though violent atorm in November last, accompanied by acathing winds, and followed by the keen frost in February, left their mark on many thing, the Euonymus, in particular, having become very brown. Many fine trees are to be found here, but near the coast, they show the effect of roagh winds. Evergreens are plentiful, and they give the line of the shore a farnished appearance at midwinter. The neighbourhood of Rothenay is famoun for the fine quality of the Strawberrien and Gooneberrien grown there; considerably over 100 acres of land being devoted to the growth of the former fruit. The overflow after supplying the want of Rothesay, find a aale at Glasgow and elsewhere. Flowers are grown extensively in the gardens abutting upon the Meadow Walk. The road between the gardens has on either aide lofty and wide-apreading trees. Two magnificent Ash trees of great age, which from time immemorial adorned this walk, were known as "Adam" and "Eve." "Adam" has succumbed to old age, but his consort, "Eve," is still quite vigorous. There are some very fine examplen of Ash in the neighbourhood of Rotheany.
At Soathbank, about 3 milea from the town, resides William Spencer, Enq, who ponseasen an admirably-furniehed place, where there are several glass erections, a select collection of Orchids, Ferns, and other foliaged planta; indeed, all that one could denire to see asnociated with auch a charming renidence. In the ground are attractive beds of Begonia and other flowering plants. Evergthing is in excellent order. The gardener is Mr. James Lornie, who e work command our praise. A few milen farther the visitor leaven the shore, and on the higher ground comes to the entrance to Mount Stuart, the reat of the Marquir of Bate, the owner of mont of the land in Bateshire. The manaion stands in the centre of a richly-wooded spot; it is a new erection, a handsome Gothic atructure occapying the site of the old manaion which, with all ita art treamares and beartifal and coatly decorations, was dentroyed by a fire which took place in 1876, but fortunately, many valuable pictares-mont of them family portraitewere anved.
The grounds about the manaion are very extenaive and of great beenuty; at thair lower portion, they terminate in a bank or cliff near the nea, Two avenues, one of Limen and the other of Beech, are wonderfal arboreal features. At certain pointe, lovely and picturetque walks and drives radiate from a centre, opening up charming vistas. There muat be miles of roadway and pathway under the trees, and as every point some wealth of natural beaty is perceived. The skill of the landucape gardener has assisted Nature in shaping the lines of woody ground of indencribable charm. The visitor feels that in the hande of Mr. Michael Heron, the gardener at Mount Stuart, the grounds and gardens are in anfo keeping. Kitchen and frait gardens, with planthouser, attest to his derotion to his daties.
Not far from Rothesay, indeed on the outekirta of the towd, resides Mr. James Dobbie, now in his to venty-eighth jear, hale and hearty, and atill devoted to his garden, spending the evening of his life in comfort and happinem. Ho lifted many vegetables, Beet, Tarnips, and Leeka in particular, and many
flowers from low to high levele of quality; and he considern his work is not yet completed. While filling municipal office, he wan an enthusiastic florist, growing Pansies, Hollyhockn, \&ce., and joining in the fray on the exhibition stage. His enthuaiam led him to resign his ordinary avocation and start a florint and seed buainess in Rothesay, now finding rapid expansion in the hand of his successors Mesurs. Cuthbertson, Birnie, and Fyfe. The buniness of Dobbie \& Co. has become an important induatry in Rothenay, and they are among the largest employert of labour. Mr. Alex. Lister, a famoun Pansy grower and exhibitor, has a nursery here; he is a raiser of very fine fancy varietien, a grower and exhibitor of Dahlias, Carnations, \&cc. Near him is Mr. Michael Cathbertson, who has an extensive collection of hardy plants, and like his neighbouru, makes a specialty of Pansies and Violas. And when the vinitor in at Rothesay, it in impossible he should forego a steamboat trip through the renowned Kylew of Bute. On his way, he calle at Tigh-na-bruaich, a Gaelic word aignifying "the house of the brae," and here, near the shore, Mr. Andrew Irvine, another famous Panay grower, has a nurnery. R.D.

## New or Noteworthy Plants.

## DENDROBIUM SANGUINEUM, Rolfe, $n$ s $s p$.*

A crimson - flowered Dendrobium is certainly something novel. No such apecies has before appeared in cultivation, so far an I have been able to difcover, and if nuch an one hav ever been dencribed, I have failed to find it. It existence, however, if now proved, and the merit of its diacovery belongs to Mesmrs. Hagh Low \& Co., of the Clapton Narsery, where the first flower expanded a few daye ago. The plant hat been submitted to Kew for determination, and has received the above name, in allavion to ite unauasl and brilliant colour. It belonga to the mection Clavipes, and has slender atems about 3 feet long, with a fasiform thickened part, some 3 to 4 inches long, and with eight ridgem near the base, in which respect it resembles $D$. crumenatum, Swartz. The flowern are olitary in the upper axils, and about an inch long, both the eepala and the broader obovate petals being crimon, except at the base in front, where they are marbled and spotted with the same colour on a whitish ground, The lip is emall, much andulate in front, and whitish, with some purple lines and spotn. It was introduced from Labuan, North Borneo, and will probably require aimilar treatment to other Maiayan apecies. Unfortunately, the flowers do not last very long, a pecaliarity common to neveral apecien of the groap; but if the plant should prove easy to cultivate, and as floriferous as D. crumenatum, a good plant would be a very atriking object. The llower produced is the firat one after importation. In any caes, it is a very interenting discovery, on account of its unique colour, R. A. Rolfe.

## Orohid Notes and Gleanings.

## ODONTOGLOSSUM URO-SKINNERI, CRAWSHAY'S VAR

Althouge imported many years ago, Odontoglosam Uro-Skinneri is a rare plant, and fine varieties of it are alway noteworthy. One of the

[^19] high, with a thickened fusiform part near the base, 3 to 4 inche long, and with eight ridges. Leaves (very young) linene oblong. Flowers solitary in the upper axils. poung) linearlong. Sepals lanceolate-oblong, subobtuse, Pedicels 5 lines dorsal one 11 lines long, lateral ones $u$ lines 3 lines broad; spatulate-obovate, subobtuse, 11 lines lines long. Petals Lip 3-lobed, 8 lines long, 11 lines long, 5 lines broad. erect; front-lobe lines long, $1 \frac{1}{3}$ lines broad; videlobem small, erect; front-lobe oblong, obtuse, undulate ; dise with thicrened median line. Mentum mecate-oblong, 3 lines long, Oolumn tout, 1 line long. Sepals and petals crimson in front pas ing towards the base to whitish, spotted and marbled with crimson; wholly crimson behind. Lip whitish, with the with lined with purple, and the lines termingting, with the front Epote at the margin; callus yellow. Native of Labusn, N.
largest and bent is in the pomemion of $D_{6} B$ Crawahay, Evq., at Ronefield, Sevenoaka. From the tip of the upper sepal to the apex of the lip the flome measures $2 \frac{7}{3}$ inches; the petals are $\frac{3}{4}$ inch wida
 petals are pale greenish-white, evenly spotted mith parplish-brown, the lower sepala being aleo flated with purple. The lip is white, densely apotted nith light rosy-lilac. Striking features in the twn beyond its aize are the breadth and even arroge ment of the segments, and the uniformity of the apotting.
Cypriprditum Kimbailianum, Hort. Sander, Gmy, it American Gardening.
With reference to the atatement made by the milar in the Orchid Review (Gardeners' Chronicle, Separ/; p. 266), in explanation of his error reapectiog tib plant, to the effect that there are two planturad Cypripediam Kimballianum, it would be wellith gave reference to the work in which the firt one, widd he calls C. prestans, was published. In his ovighal note, he refers to C. prestans Kimballianum, wihe is properly figured and noted in the Limamin vol, vi, and it appears to be atraining mattan to drop the specific name, and thus set up a bogey in order to have the honour of knocking it dom.
Cypripedium Kimballianum, as illastrated in th Gardeners' Chronicle, formed the text of the nowin the Orchid Review, and there was no excua tum bringing in the other apecies mentioned, the ments sbout which are ancient hintory to. Ortill growers.
The voluntary dencription of C. Kimballinm, too, given (Gardeners' Chronicle, Sept. 7, 1895), wu equally unnecenary. The plant was propert described by Mr. Grey in American Gardemin, wid courtery demands that the work of our Amerine cousin thould be recognised. J. $O^{\prime} B$.

## FRANCE.

M. Gaston Cmandon de Berailues in wellhem as a lover of plante, especially of Orchids and Ciso diums. His fine garden is well caltivated by lii gardener, M. Dauvinat. Going through the bownt we noticed a new eeedling Caladium named Trionph d'Epernay. This variety is of dwarf and complat habit, with atout petioles, and leaves of a fine dullion colour; it will soon become popular, and be ued in the same purposes as are C. minus erabescens and $C$, argyriten. We were sarprised to see two planta if Agave americans in fall bloom, in tubs 5 feet nquiln The flower-apiken messure a foot in diameter th the baee, and are nearly 8 yarde in height, benill numerous branchen, with heary umbels of gellor flowers, the whole plant auggesting an imman chandelier, was an unueual sight.

At Liemonse's Nursery, at Nancy, which eatist lishment is as well known in England as on the continent, we admired a good collection of Cannew is bloom, snd a splendid lot of Phlox, carefally y melecke for soed, the collection of dwarf white and rons nesip ties were excellent. We cannot say too much abont the Gladioluu. The plante are only beginning to fonf thousands of spikee will soon be open, nearly all wo blooms are extremely large, covering the apike, ald the coloars are brilliant and clear. Some blaen all light purple varietien denerve apeciel mention bo Enormous quantities of Montbretia are here to seen, amongat them many good new weedlingr.
Another auccessful horticalturist is M. Caotuen Nancy. His tuberous Begonias have for nome tive proved their auperiority at many exhibitiont, their caltivation is acceenfal owing to the call taken in selecting and saving good varietios inche Flowers, aingle and double, messuring 5 or 6 inch across are not uncommon, and the erect habin olut plante double their value. One interesting was noticed in this nuraery, a hybrid Streptocirn S. Wendlandii $\times$ S. controvercas, the plane wo to bo yet named, bat will woon be described, it neeme the free-flowering and quick growing. Wo hope, rbe deacribing this hybrid, to give alno $s$ photograp reproduction of it.

A well-known firm is that of Baltet frères, at Troyen. There we admired a aplendid collection of Pear and Apple treen, ad were particularly interested with the new process used for the cultivation of Pear trees in the chalky oil of Chsmpagne. Young plants of Crategua Oxyacantha are obtained from seed; this apecies will thrive in any calcareous soil even, if this is not deep. When these plants are establiahed, Cratwgus Carrierei is grafted upon them, and the next year grafts of good varieties of Pears are inserted on the Cratmgna Carrièrei. We saw the treen; mome Pears were on them, though growing in sach noil as Pear trees would never thrive npon. Polygonam aschalinense is here extensively grown; it has oven been utilised for haman food, and M. Baltet told me that the flavour of boiled Polygonum was much like that of Spinach.
Oar visit to Troyes took place on Jaly 28 last, and We were attonished to see on the walle some beautiful

Clapton, had Dendrobiam pecioninimam, but the flowers were not in aufficiently good order to be appreciated.
At the Vegetable Committer a fine batch of twenty-five distinct varieties of Cacumber wan etaged by M. Vilmorin, and the floral committee voted a Firat-class Certificate to Tillandaia Sieboldiana, a beatifal and rare Mexican plant, little known in caltivation, and characterised by vermilion-red floral bracts, perpendicular to the epike, stager by M. Traffat of Veraillem. George Truffaut.

## A FINE VINE.

The following detaile respecting a Black Hamburgh Vine in these gardens may be of interent to some of your reader ( $\mathrm{G} . \mathrm{g} .52$ ). The Vine is twenty-flve jears old, and atand in the centre of a house 54 feet long by 13 feet wide, which it completely covers

Fig. 52.- ving at hacethorn hall, lincoln.
ripe Nectarinen. We moon learned that the fruit was a quite new variety raired from seed by Mr. Lacien Baltet, who has given it him own name. Thia Nectarine, which is of a fine deep zolour, is a seedling of the Prfecoce of Croncela, which directly resulted from a seedling of Amsden Peach. The carious fact no often commented apon of a Nectarine being raised from a Peach atone was, in thic case, abolutely borce out. We found the new Nectarine, L. Baltet, of delicious flavour, and ao also thought the members of the Frait Committea at the last meeting of the Society in Paria.

Lalio-Cattliya Andrgana, \&c.-A very good plant, thown to the Orchid Commertes (Paris) lately, was a hybrid between Cattleys bicolor and Lxe'ia elegang. This Lxlio-Cattleya, named L.* C. Andreana by the raiser, M. Maron, gardener at M. L. Farnier's, Marseillea, is quite a diatinct variety. The flower is rather larger than that of C. bicolor; the division are of a creamy-rose colour, the lip presenting an unuaally long middle lobe of a dall magents colour. The upright paoudo-bulb is cylindrical, with two leaver; the variety seems freegrowing; it was first nows in 1890 . Mr. Low, of

It apring from aingle upright atem, the girth of which is 1 foot, and which mends out two horizontal branches in opposite directions. From these descend ten maller branches, which follow the slope of the roof. The Vine is alway very clean and healthy, and is now bearing 390 bunches of well-coloured Grapen. I thotuld be interented to know if there are many larger Vines in private gardens. E, W. Cracroft, Hackthorn Hall, Lincoln.

## NOTES ON MORELLO CHERRY CULTURE.

Seldom is the crop of Morello Cherries in a private garden larger than necestary, there being so many ways in which the frait can be uned. We do not une the fruit for dessert much in this conntry, bat I believe it is so used in mouthern Earope, and also in Britain if the fruit has been grown under glas. The treen are, however, more often planted at the foot of walls with northera aapect than eleewhere, yet when they are grown under clear glame, exposed to full mun, the fruit is much changed in Gavour. I tbink it was Mr, Knight (when at Floors

Cartle Gardens), who wrote of them, testifying to their excellence when caltivated under glam. I have grown them only to a limited extent in pote in orchard-houses, but could easily appreciate the fine flavour which the frait would attain when grown in warmth and given abandance of air. Even on a south wall, the improvement of flavour in great compared with that of fruit from a northerly aspect. In aize the Morello Cherries I have seen in Wiltahire and around Bath were finer than I have seen anywhere. In a Scottish town Morello Cherries have been produced in quantity on an old tree whose root were firmly embodded in soil under the pavement, and where moisture mut have reached the roots with difficalty. These Cherry trees never required praning, though in hot, dry quarters, during the summer month, the foliage alway remained healthy, and the frait was very dark in colour.

On a south-east wall, where the soil about the roots of Morello Cherries is composed of atrong loam and lime-rabbish, crammed an tightly together an ponible, and where a road with much traffic panes over the border, there are beavy crops of Morello Cherrie every year, and during the prement season the crop required to be thinned. It is of great moment to caltivate the trees so that little pruning is neceseary, and the natural epars and short growth then formed render the trees safe from canker. On a north wall, and one due east, we do not alway get heavy crops, and the fruit is more acid than on the trees facing south east. This year many of the treen, for want of time (by reason of the continuous late front), were left antied, and with little praning. These mostly set heavy crope of fruit; but we never at any time bad to contend so much with grabs, hand-picking was done, and this was followed up by application of suft mosy-water, in which was mixed hellebore-powder. While in north aspects in Scotland I should be inclined to train Morello Cberrie close to walls, in ponitions where an had full power, I should prefer allowing the wood to grow outward somewbat, and by attention to keeping the root in very firm coil, with plenty of lime in it, the growthe would be short and fruitful. 1 An object-lewion on the good cultare of Morello Cherries I once had at the Royal Gardens, Windeor, many yeara ago, when on a vinit to the late Mr. Rose. The joung-bearing wood was short, and allowed to hang from main branche antouched. The crop of fruit was immente. Though good Morello Cherriea can be grown in quantity on atandard bush-trees in mome place, those fruited on much in Scotland are very poor. M. Temple, Carrom, N.B.

## Plant Notes.

## IMPROVED VARIETIES OF CANNA.

Two housen full of thene plante at the Royal Hor ticultural Society's Gardenm, Chiswick, are now looking remarkably well. They combine fine ornamental foliage with blomome, which rival Gladioli in their bearty, and they last in good condition much longer than the latter. These plante require liberal treatment, and a certain amount of protection in order to flower them perfectly in this country. If nothing ele was to be seen at these gardens, the Cannas alone would be worth a visit; but I noted many other interenting and instructive thinge in the brief time at my disponal.

## Cumatis Davionesa.

This plant in at preaent flowering well in the bordera at the Royal Horticultural Society' Gardens, Chiswick, and it sweet-scented lavender-coloured fiowert compel one'a attention. It appears to require s warm climate, as it doen not sacceed half yo well with me at Belvoir, although it is growing in a sheltered ponition. Such a beautiful plant in well worthy of a place under glass, where apace admita of it, and if specimen plants were in fashion, it would prove a good thing for exhibition purposes. W. H. Divert, Belvoir Castle Gardene, Grantham.

Pancratidm canariense.
Thone who hate before them the recently-inaued part of the Joursal of the Royal Horticultural Society, in which is an extremely interesting and important account of "the Plants and Gardens of the Canary Islands," by Dr. Morris, the Assiatant-Director at Kew, may be intarested to know that Pancratiam canariense is now flowering in the Botanic Gardens at Cambridge. It is one of the three species of balbons plants said to be specially noteworthy, the other two being kinds of Romulea. As a garden plant it is decidedly pretty, but without much showiness. It is quite a distinct plant, moat nearly allied, perhape, to P. maritimum, though amaller in all its parta, except for the longer wcape, and in common with all the other species that has white flowert. In a 6 -inch pot we have one lowering balb with everal others, which bear ensiform glancoun leaves about 14 inches long. The scapo exceeds 2 feet, and apports an ambel of a dozen llowers, two or three of which open at the same time. The perianth segments are narrow, and apread about $2 \frac{1}{4}$ inches; the staminal cap is broadly campanulate, with a diameter of $1 \frac{1}{3}$ inches. This apecimen is placed in an intermediate-house, and flourishes with asaal treatment. $R$. J. $L$.

## Browallia speciosa majob.

This charming greenhouse plant was seen in excellent character at the recent exhibition of the Trowbridge Horticaltaral Society. The foliage and flowers alike are much larger, bolder, and more striking in appearance than those of the well-known form of $B$. elata. It appears to be very free, and the deep hue of blae in the flower makes it valuable for associating with other plants in the decoration of the greenhouse. It is one of the novelties introduced by Menra. F. Sander \& Co, and it gained an Award of Merit from the Royal Horticaltaral Society in 1894. It only requires to be known in order to be widely grown.

Praargonitia (Drcorative) Madame Chatues Kommi.
The value of this variety for cutting parposes is shown by the fact that Mr. W. Richardeon, the manager at Mesara. Balchin \& Sons' nuraeries at Hassocke, has cat during the space of twenty weeks as many as 12,050 trasses from 230 plante, and they are still fall of budf. Mr. Richardson considers it to be the finest of the white-flowered decorative varieties, and in his experience there in none other so free-flowering. That is one reason why it is grown so largely at the Hassocki narnery; another is, that it is in great demand.

## Fuchsia coccinea.

Whether or no this represent the original specien which Mr. Jamen Lee parchased at Wapping so many yeara ago I cannot way with certainty, but I call attention to it for the purpore of naying what a pretty shrub it makes in the open border. I saw little buther of it at Memra. J. Cheal \& Sona' Lowfield Nurseries, Crawley, a few daya ago, forming a part of the second line of a mixed border, and very pretty it was, and singularly free. I think this pecier, mingled with $\Delta$ gathea coolentis and a white Viola like Sylvis, or the tinted William Niel, would make a charming combination for a nummer bed, I presume the planta at the Lowfield nurweries had pased throagh the rigours of last winter without any harm to the root stock. $R$. D.

## CHRYSANTHEMUM $\times$ PRINCESS MAY.

In our isaus for Auguat 17, apecial mention was made of a very fine collection of new single-flowered hybrid annual Cbrysanthemume, which were exhibited by Mr. Henry Brownhill, needsman, Sale. We now give an illustration of one of the best of these (Ag. 53, p. 295), known as Prineens May. The
flower it white, with a deep yello flower in white, with a deep yellow ring round an excelilent shape and decorativo bad, and the flower of exceilent ohape and decorative valuc. There hybrids,
obtained by erouning $C$. cornanium natum, may be propagated by meana of cattingar.

## BOTANICAL SECTION OF THE <br> BRITISH ASSOCIATION.

The annual meeting of the association in in progress at Ipswich. The pablic business was opened oo Wednesday by an address from the President, Sir Douglas Galton, who gave an account of the progress of acience generally during the last sixty-five years, prefacing it with a few remarks on the career and personality of the late Prof. Haxley. On Thursday the business of the several sections began. The Botanical Section was opened by an address from Mr. W. T. Thiselton Dyer, C.M.G., the Director of the Royal Gardens, Kew, the substance of which we give in part in the following columne.

Retrospect.-I confess I found it a great temptation to review, however imperfectly, the hitory and fortunes of our subject while it belonged to section D. But to have done so would have been practically to have written the history of botany in this conntry since the first third of the centary. Yet I cannot pais over some few striking eventr.

## Bater and Robert Brown.

I think that the earliest of these mast undoubtedly be regarded as the most poch-making. I mean the formal publication by the Linnean Society, in 1833, of the first description of "the nucleas of the cell," by Robert Brown.* It neems difficult to realise that this may be within the recollection of some who are now living amongst us. It is, however, of peculiar interest to me that the firat peran who actually distingaished this all-important body, and indicated it in a figure, was Francis Bauer, thirty years earlier, In 1802. This remarkable man, whose akill in applying the resources of art to the illuatration of plant anatomy has never, I auppose, been aurpassed, was "renident draughtsman for fifty years to the Royal Botanic Garden at Kew." And it was at Kew, and in a tropical Orchid, Phaius grandifolia", no doubt grown there, that the discovery was made.
It was, I confess, with no little admiration that, on refreshing my memory by a reference to Robert Brown's paper, I read again the vivid account which he gives in a footnote of the phenomens, so painfully familiar to many of who have been teachers, exhibited in the staminal hair of Tradescantia. Sir Joseph Hooker $\dagger$ has well remarked that "the sapreme importance of this observation, . . . leading to undreamt-of conceptions of the fundamental phenomene of organic life, is acknowledged by all investigatore." It is ningular that so profound an observer as Robert Brown should have himself miseed the nignificance of what he anw. The world had to wait for the discovery of protoplasm by Von Mohl till 1846, and till 1850 for it identification with the aarcode of zoologist by Cohn, who is atill, I am happy to say, living and at work, and to whom last jear the Linnean Society did itself the honour of presenting its medal.
The Edinburgh meeting of the Ansciation, in 1834, was the cccasion of the announcement of another memorable discovery of Robert Brown's. I will content myself with quoting Hofmeister's $\ddagger$ account of it. "Robert Brown was the discoverer of the polyembrony of the Coniferm. In a later treatise he pointed out the origin of the pro-embryo in large cells of the endonperm, to which he gave the name of corpuccula." The period of the forties, jant half a century ago, looks in the retroapect as one of almost dezzling discovery. To say nothing of the formal appearance of protoplasm on the scenp, the fonadations were being laid in all directions of our modern botanical morphology. Yet its contemporaries viewed it with a very philonophical calm. Thwaites, who regarded Carpenter as his master, described at the Oxford meeting in 1847 the conju. gation of the Diatomacere, and "distinctly indicated," as Carpenter \& saya, "that conjagation is the primitive phate of sexual reproduction." Berkeley informed me that the announcement fell perfectly flat. A year or two later Suminuki came to London with his uplendid discovery (1848) of the archegonia of the

[^20]Fern, the antheridia having been firt teen by Näzeli in 1844. Carpenter * gave me, many yenn after, a carious account of its reception, "At ith Conncil of the Ray Societr, at which," he naid, "I advocated the reproduction of Suminskira book ou the Ferns, I was assured that the close resemblence of the antherozoids to spermatczoa was quite nifio. cient proof that they coald have nothing to do mith vegetable reproduction. "I do not think," he added -and the complaint is pathetic-" that the mend the present generation, who have been broaght ap in the light, quite apprehend (in this as in other matters) the utter darknens in which we were the groping, or fully recognise the deserts of thown mion helped them to what they now enjoy." This min 1875, and I auppose is not likely to be lens true now, Darfin, Huxley, Hoorer,
The Oxford Meeting in 1860 was the acene of $y^{\prime}$ mecorable debate on the origin of apecier, at nit it is interesting to remember that Henslow preinit On that occasion Section $D$ reached its meridim The battle was Homeric. However little to the taste of its author, the launching of his great theor was, at any rate, dignified with a not inconaiderabib explosion. It may be that it in not given to the men of our day to roffla the dull level of pablie placidity with disturbing and far-reaching idem But if it were, I doubt whether we have, or ned now, the fierce energy which inspired then either the attack or the defence. When we met aginin Oxford last year the champion of the old confilits stood in the place of honour, acclaimed of all men, a beautiful and venerable figure. We did not hoor then that that was to be his farewell,
The battle was not in vain. Six jears aftermarih at Nottinghsm, Sir Joseph Hooker deliverad hin clanical lecture on Insalar Floras. It implicitly accepted the new doctrine, and applied it with admirable effect to a field which had long waited for an illaminating principle. The lecture itself hen since remained one of the corner-atones of thit rational theory of the geographical distribution of plant which may, I think, be claimed fairly uof purely English origin.

## Henslow.

Addreming you as I do at Ipawich, there fie cee name written in the annain of our old Section which I cannot pass over-that of Henalow. He wat the Secretary of the Biological Section at its first meet. ing in 1832, and its Prenident at Britol in 1836. I sappose there are few men of this centary who have indirectly more influanced the carrent of hamsa thought. For in great measure I think it will not be contented that we owe Darwin to him, As Romanes has told ust: "His letters writesen to Professor Henalow daring his voyage round the world overflow with feelings of affection, veneration, and obligation to his accomplished master and dearest friend-feelingo which throughout hit liff he retained with no diminished intensity. Ao ho nud himself to way, before he knew Profenor Henilor the only objects he cared for were foxes and prro tridger." I do not wioh to overatate the factan The posseasion of "the collector's iastinct, stroog is Darwin from his childhood, an in unally the case in great naturalista," to use Haxley'\& worde, woll have borne its usual fruit in after life, in eome shap or other, even if Darwin had not fallen into Hero slow'i hands. Bat then the particalar train of eventa which culminated in the great work of his life would never have been atarted. It appeered to me, then, that it would not be an altogether unite tereating investigation to ascortain something abont Henslow himself. The resalt has been to proride me with several texta, which I think it may be pot anprofitable to dwell apon on the preenent occuivitio In the firat place, what was the secret of hin ind ence over Darwin? "My dear old master in Naturn History" (Life, ii. 317), he calle him; and tmatan atood in this relation to Darwirs gs no amall matal

> Loc.cit. 141. $\dagger$ Memorial Notices, 13.
> Proc. R.S., zliv., vi.
> As I shall have frequent cocsesion to quote the $i f 6$ Lettere, I ohall insert the references in the text

Again, he speaks of his friendship with him as "a circumatance which influenced my whole career more than any other" (i, 52). The aingular beauty of Henalow' character, to which Darwin himuelf bore noble tentimony, would count for something, but it would not in itself be a sufficient explanation. Nor was it that intellectual farcination which often bind papils to the master's feet; for, as l)arwin tells us, "I do not suppose that anyone would asy that he possessed much original genius" (i. 52). "The real attraction neems to me to be found in Henolow poseanion, in an extraordinary degree, of what may be called the Nataral History apirit. Thia resolves itself into leen observation and a lively interest in
to be looked at again; or perhape writen a paper on nome obvious phenomena which he could have atudied with less fatigue in the Palm-house at Kew.
The secret of the right use of travel is the posesnion of the natural history instinct, and to those who contemplate it I can only recommend a careful tudy of Darwin's Naturaliut's Voyage. Nothing that came in his way eeem to bave evaded him, or to have seemed too inconsiderable for attention. No doubt some respectable travellers have lost themselve in a maze of observation that have led to nothing. But the example of Darwin, and I might add of Wallace, of Huxley, and of Moneley, whow
history in the Univeraity previout to his taking up his renidence there." The Professor of Botany had delivered no lectares for thirty years, and though Sir James Smith, the founder of the Linnean Society. had offered him services, they were declined on the ground of him being a Nonconformist.*
As to Henslow's own scientific work, I can but rely on the judgment of those who could appreciate it in relation to it time. Aecording to Berkeley, + "he was certainly one of the flrat, if not the very first, to see that two forms of fruit might exiat in the same fungas." And this, ne we now know, was a fandamental advance in this branch of morphology, Sir Joneph Hooker telle me that his papert were all diulinctly in advance of his day, Before occupying the chair of botany, he held for some years that of mineralogy. Probably he owed this to hir paper on the Isle of Anglesey, published when he wat only twenty-nix. I learn from the same authority that this to some extent anticipated, but at any rate atrongly influenced, Sedgwick nubsequent work in the same region.

## Botanical Teaching.

Henslow' method of teaching denerve atudy Darwin mays of his lectures "that he liked them much for their extreme clearnens." "But," he addm, "I did not etudy botany" ( i , 48) , Yet we must not take thi too eriounly. Darwin, $\ddagger$ when at the Galapagon, "indiacriminately collected everything in flower on the different islands, and fortunately kept my collection separate." Fortunately indeed; for it was the result extracted from theme collections, when worked up absequently by Sir Joseph Hooker, which determined the main work of his life. "It was nuch cases as that of the Galapagon Archipelago which chiefly led me to study the origin of apecies" (iii. 159).

Henslow's actual method of teaching went some way to anticipate the practical method of which we are all so proud. "He wat the first to introduce into the botanical examination for degrees in London the syatem of practical examination."\& But there was a direct simplicity about his clas arrangements characteriateric of the man. 'A large number of specimens. . . were placed in basket on a idetable in the lecture-room, with a number of wooden plates and other requisite for disecting them after a rough fashion, each atudent providing himself with what he wanted before taking his seat." ${ }^{3}$ || Io not doubt that the reulta were, in their way, as efficient as we obtain now in more atately laboratorien.

The moat intereating feature about his teaching wha not, however, it academic anpect, bat the une he made of botany as a general educationel instrument. "He alway held that a man of no powern of obwervation was quite an exception." "He thought (and I think he proved) that botany might be used "for atrengthening the obeervant facultien and expanding the reasoning powern of children in all clawes of cociety."** The difficulty with which tho who undertake now to teach our subject have to deal is that mont people ank the question, What is the use of learning botany unlen one means to be a botanist? It might indeed be replied that as the vant majority of people never learn anything effectively, they might as well try botany am anything else. Bat Henslow looked only to the mental discipline; and it was characteristic of the man and of his belief in his methods that when he was summoned to Court to lecture to the Royal family, hie lecture" "were in all respecte, identical with those he way in the hable of giving to his little Hitcham weholarw"; $\dagger+$ and it munt be added that they were not lems succenafal.

This auccess natarally atiracted attention. Botmnical teaching in schools was taken up by the Government, and contiaue to receive aupport to the present day. Bat the primitive mirit han, I am afraid, evaporated. The measurement of reults by means of examination has been fatal to itm marvival. The teacher has to keep steadily before hil eyen the

necesity of earning his grant. The educational problem retires into the background. "The strengthening of the observant facalties," and the rest of the Henslowian programme mut give way to the imperious necenity of prenenting to the examiner candidates equipped with at least the minimum of text-book formulas reprodacible on paper. I do not speak in this matter without painful experience. The most astate examiner is defeated by the atill more astute crammer. The objective baais of the study on which its whole asefaness is built ap is promptly thrown aside. If you supply the Appleblonsom for actual description, you are as likely as not to be farniabed with a detailed account of a Buttercap. The training of obervation hat gone by the board, and the exercise of mere memory has taken its place. Bat a table of logarithms or a Hebrew grammar would serve this parpose equally well. Yet I do not deapair of Henslow's work atill bearing fruit. The examination aystem will collapse from the sheer impossibility of carrying it on beyond a certain point. Freed from its trammels, the teacher will have greater acope for individuality, and the realt of his labours will be rewarded after nome intelligent aytem of inapection. And here I may claim support from an unexpected quarter. Mr. Gladstone has recently written to a correspondent: -"I think that the neglect of nataral history, in all its multitade of branches, was the grossest defect of our old ayatem of training for the young; and, farther, that little or nothing has been done by way of remedy for that defect in the attempts made to alter or reform that system." I am sure that the importance and weight of this teatimony, coming as it does from one whose training and sympathien have always been literary, cannot be denied. That there is already some revival of Henalow's methods, Ijadge from the fact that I have received applications from Board schoole, amounting to some handredy, for surplus apecimens from the Kew maseumr. Without a apecial machinery for the parpone I cannot do much, and perhaps it is well. But my ataff have willingly done what was ponsible, and from the letters I have received I gather that the labour has not been wholly misspent.

## Musedu Arrangement

This leade me to the last branch of Henslow's scientific work on which I am able to touch, that of the arrangement of maseam, eapecisily those which being local have little meaning unless their purpose is atrictly educational. I think it is now generally admitted that, both in the larger and narrower aspects of the question, his ideas, which were shared in ame measure by Edward Forber, were not merely far in advance of his times, bat were ensentialy sound. And here I cannot help remarking that the zoologists have perhapa profited more by his teaching than the botanistr. I do not know how far Sir William Flower and Profenor Lankeater woald admit the influence of Henslow'a idens. But, so far as my knowledge goes, I am not aware that, at any rate in Earope, there is anything to be aeen in pablic manenms comparable to the educational work accomplished by the one at the College of Sargeons and the Naturnal History Maseam, and by the other at Oxford.
I have often thonght it ningular that in botany we have not kept pace in this matter with our brother naturalints. I do not doabt that regetable morphology and a vast number of important facts in evolution, as illustrated from the regetable kingdom, might be presented to the eye in a facinating way in a carefully-srranged museum. The most anceensul and, indeed, almost the only attempt which hae been made in this direction is that at Cambridge, which, I believe, is due to Mr, Gardiner. But our technical methode for precerving specimens atill leave much to deaire. Something more satiafaotory will, it may be hoped, some day be devined, and the whole aubject in one which is well worth the careful conaideration of our Section. Hemalow at least effected a vaet improvement in the mode of diaplaying botanical which was exhibited at one of the Paris owathanditions,
excited the warm admiration of the French botaniats, who always appreciate the clear illastration of morphological factu.

## Old School of Natubal History.

If the old school of natural history of which Henslow in his day was a living spirit is at present, as neema to be the cane, continually losing its hold upon as, this has certainly not been due to its want of value as an educational diacipline, or to its sterility in contribating new ideas to haman knowledge. Darwin's Origin of Species may certainly be regarded as it off ppring, and of this Huxley * says with justice: "It is doabtfal if any single book, except the Principia, ever worked so great and rapida revolation in acience, or made so deep an impression on the general mind." Yet Darwin's biographer, in that admirable Life which ranks with the few really great biographies in our langaage, remarks (i, 155): "In reading his book one is reminded of the older naturalists rather than of the modern achool of writera. He wan a naturalist in the old sense of the word, that is, a man who works at many branche of acience, not merely a specialist in one." This is no doubt true, but does not exactly hit off the distinction between the hind of atady which has gone out of fashion and that which has come in. The older workers in biology were occapied mainly with the external or, at any rate, gronser festares of organism and their relation to surrounding condition ; the modern, on the other hand, are engaged on the stady of internal and intimate structure. Work in the laboratory, with its necenary limitations, takes the place of research in the field. One may almost, in fact, ary that the une of the compound microscope divides the two classes. Aua Gray has compared Robert Brown with Darwin as the "two British naturaliate" who have, "more than any others, impressed their influence upon science in the nineteenth centary." $\dagger$ Now it is noteworthy that Robert Brown did all his work with a simple microncope. And Francis Darrin writes of his father: "It strikes us nowadays as extraordinary that he should bave no compound microscope when he went his ' Beagle ' voyage; but in this he followed the advice of Robert Brown, who wat ar authority on auch matters" (i. 145). One often meets with pernons, and nometime of no amall eminence, who apeak as if there were some necensary antagonism between the old and the new atadies. Thas I have heard a distinguished aystematist dencribe the microscope as a curae, and a no lem diatingaished morphologist peak of a herbarium having its proper place on a bonfire. To me I confese this anathemstisation of the instrument of research proper to any branch of our sabject is not easily intelligible. Yet in the case of Darwin himself it is certain that if his earlier work may be waid to rent solely on the older methods, his later researches take their place with the work of the new echool. At our last meeting Pfeffer vindicated one of hin latent and mont important observations.
The case of Robert Brown is even more atriking. Ho is equally great whether wa clans him with the older or the modern echool. Ia fact, so far as botany in this country is concerned, he may be regarded as the founder of the latter. It is to him that we owe the establishment of the atructare of the orule and its development into the seed. Even more important wero the discoveries to which I have already referred, which altimately led to the entablishment of the group of Gymnosperms. "No more important discovery," says Sach, $\ddagger$ "was ever made in the domain of comparative morphology and aystematic botany. The firat ateps towards this resalt, which wan clearly brought out by Hofmeister twenty-five yeara later, were aecured by Robert Brown's res aearches, and he was incidentally led to these researches by aome difficulties in the conatraction of the meed of an Auatralian genus." Tet it may be remembered that he began his career as naturalist
to Flinders' expedition for the exploration of Aug-

[^21]traliz. He retarned to Eagland with 4.000 "for the most part new apecies of planta." And thene have formed the foundation of our knowledge of the flora of that continent. Brown's chief work wh done between 1820 and 1840 , and, as Sachs * tells an, "was better appreciated during that time in Germanay

## Modern School,

The real founder of the modern teaching in this country in both branches of biology I cannot doabs was Carpenter. The first edition of his admirable Principles of Comparative Physiology was published in 1838, the last in 1854. All who owe, as I do, a deep debt of gratitude to that book will agree mith Huxley $\dagger$ in regarding it as "by far the bett genemal arvey of the whole field of life and of the broud principles of biology which had been prodaced ap to the time of its pablication. Indeed," he aide "although the fourth edition is now in many respent ont of date, I do not know its equal for bredith of view, sobriety of specalation, and accaracy of detail."
The charm of a wide and philosophic anrveg of the different forms under which life presents ituelf could not but attract the attention of teachern. Rolleston elaborated a coarse of instraction in zoology at Oxford in which the atructures deacribed in the lecture-room were subsequently worked oots in the laboratory. In 1872 Huxley organised the memorable course in elementary biology at South Kensington which has aince, in its easential featuree, been adopted throughout the country. In the follon: ing year, during Haxley's absence abroad throngh ill-health, I arranged, at his request, a courre of inatruction on the ame lines for the vegetab's kirgdom.
That the development of the new teaching wa inevitable can hardly be doubted, and I for my part am not disposed to regret the share I took in it. But it was not obvious, and certainly it was not expected, that it would to so large an extent cut the ground from under the feet of the old natanl history stadien. The consequences are ratter aerions, and I think it is worth while pointing them out.
In a vast empire like our own there is a good deal of work to be done and a good many posts to be filled, for which the old natural history training was not merely a uaefal bat even a necemary proparation. But at the present time the univerities almost entirely fail to aupply men anited to the work. They neither care to collect, nor bave they the skilled aptitade for observation. Then, though this country is possensed at home of incomparsble atores of accamalated material, the class of competent amatears who were mostly trained at our universities and who did ach good service in working that material out is fast disappearing. It mas not be easy indeed in the futare to flll important posts even in this country with men possensing the necessary qualifications. But there was still another source of naturalists, even more anefal, which bat practically dried ap. It is an interesting fact that the large majority of men of the lat generation who have won distinction in this field have begun their career with the stady of medicine. That the kind of training that natural history studies give in of advantage to stadents of medicine which, rightily regarded, is itself a natural history itudy, can hardly be denied. But the exigencies of the medicel curriculum have crowded them out; and this, I am afraid, mast be accepted as irremediable. I eannot refrain from reading you, on this point, an extract from a letter which I have received from a dietino grished official lately entratted with an important foreign misaion. I should add that he had himelf been trained in the old way:-
"I have had my time, and mast leare to younget men the delight of working these interesting fielde Such chances never will occur again, for roade ar now being made and ways cut in the jungle and forest, and jou have at hand all worts of trees leoel

[^22]Memorial Skutch, 67.
on the ground ready for atudy. These bring down with them Orchids, Ferns, and climbers of many kinds, including Rattan Palmn, \&cc. But, excellent as are the officers who devote their energy to thas opening up thi country, there is not one man who knowa a Palm from a Dragon-tree, so the chance is loat. Strange to ary, the medical men of the Government service know less and care less for natural history than the military men, who at least regret they have no training or atudy to enable them to take an intelligent interest in what they aee around them. A doctor now-a-days cares for no living thing larger or more complicated than a bacterium or a bacillus."
But there are other and even more serious ground why the present dominance of one aspect of our aubject is a matter for regret. In the concluding chapter of the Origin, Darwin wrote: "I look with confidence to the fatnre-to young and rining naturalists." But I observe that most of the new writer on the Darwinian theory, and, oddly enough, eapecially when they have been trained at Cambridge, generally begin by more or less rejecting it as a theory of the origin of species, and then proceed unhesitatingly to reconstruct it. The attempt rarely aeems to me aucceafful, perhaps because the limite of the laboratory are unfavourable to the accumulation of the class of observations which are nuitable for the parpose. The laboratory, in fact, has not contributed much to the Darwinian theory, except the Law of Recapitulation, and that, I sm told, is going out of fashion.

The Darwinian theory, being, as I have attempted to show, the oatcome of the natural history method, rested at every point on a copious basil of fact and observation. This more modern speculation lackt. The reant is a revival of transcendentalism. Of this we have had a copious crop in this country, but it is quite put in the abade by that with which we have been supplied from America. Perhap the most remarkable feature is the persistent vitality of Lamarckism. As Darwin remarks: "Lamarck's one arggention as to the csuse of the gradual modification of apecies-ffort excited by change of con-ditions-was, on the face of it, inapplicable to the whole vegetable world" (ii. 189). And if we fall back on the inherited direct effect of change of conditions, though Darwin admits that "physical conditions have a more direct effect on plants than on animala" (ii. 319), I have gever been able to convince myself that that effect was inherited. I will give one illuatration. The difference in habit of even the ame apecies of plant when grown under mountain and lowland conditions is a matter of general observation. It would be difficult to imagine a case of "acquired characters" more likely to be "inherited." But this does not seem to be the case. The recent careful research of Gaston Bonnier only confirms the experience of cultivators. "The modifications acquired by the plant when transported for a drfinite time from the plaine to the Alps, or vice verea, disappear at the end of the same period when the plant is restored to it original conditions." *

Darwin, in an eloquent pasage, which is too long for me to quote, $t$ ham shown how enormously the intereat of natural history is enhanced "when we regard every production of Nature an one which has had a long history." and "when we contemplate every complex atructure ... an the summing ap of many contrivances." Bat this can only be done, or at any rate began, in the field and not in the laboratory.

A more serious peril is the dying out amongat ut of two branches of botanical atudy in which we have hitherto occupied a position of no amall diatinction. Apart from the staffs of our official institations, there seems to be no one who either taken any intereat in, or appreciates in the amallest degree, the importance of aytematic and deacriptive botany. And geographical distribution in almost in a worne plight, yet Darwin calls it, "that grand aubject, that almont keyatone of the laws of creation " (i.356).

[^23]$\dagger$ Origin, 426.

I am aware that it is far easier to point out an evil than to remedy it. The teaching of botany at the present day has reached a pitch of excellence and earneatnens which it has never reached before. That it is somewhat one-sided cannot probably be remedied without a subdivision of the abject and an increase in the number of teachert. If it han a positive fault, it is that it is mometimes inclined to be too dogmatic and deductive. Like Darwin, at any rate in a biological matter, "I never feel convinced by deduction, even in the case of H. Spencer's writings" (iii. 168). The intellectaal indolence of the stadent inclinea him only too gladly to explain phenomena by referring them to "inms," instead of making them tell their own atory.
(To be continued.)

## VEGETABLES

## VEGETABLES AT HIGHCLERE

Authovar Mr. Pope, the gardener at Highclere, is noted for his success in exhibiting vegetables, it should not be anumed that the growth of prodace for exhibition absorb his whole intereat. To a gardener of nuch experience and pertonal knowledge of vegetables, the tenting of new varieties is an agreeable and intereating employment. To visitors this is an important item, 28 one is sure to see much that is now and interesting. When visiting Highclere just previous to the great Shropshire show, I had an opportanity of seeing some of the specimens in courte of preparation for that meeting. The kitchen garden appears eapecially well adapted to vegetable calture, particularly in such a season as the present ; the aspect is a weaterly one, baving e sharp alope in that direction. A dry summer exactly nuite nuch a garden, for owing to the great depth of soil, and the cooler condition of the garden itself, consequent upon its aspect, the vegetable crops have positively revelled, even during the fierce heat. A tablet over one of the entrances to the garden discloses the fact that the garden has been in existence over 100 years.
Potatos are made astrong point in collections of vegetables hown by Mr. Pope, for he rightly considere this vegetable the most important of all. Satiafaction is a favourite variety for exhibition, as it combines good form with a clean skin, and, what is more, it cooking qualities are of the highest. Satton's Seedling is also e favourite, and it too combines all the qualities that make Potator valuable. Windsor Castle is esteemed highly, and so is Reading Ruset and Prizetaker; the latter has excellent quality here. Mr. Pope does not believe in the crowding method of Potsto culture. Abundant apace is allowed them here, that they may make a full development of haulm and foliage.

Onion are remarkably well grown, not only for exhibition but as a crop for home use. For the former purpose, nome magnificent balb were seen many ample of Excelsior-a variety rained by Cranston-I noted that measured 18 inches in circamference, and it is regarded the finest Onion for exbibition in cultivation. It is sometime thought that anch Onions as these are useleas for any other parpose; but this is an error-they will and do keep sound until April. The seed is sown in a gentle hest in January, and the plants are pricked off into boxes of rich noil, grown on gradually, and thoroughly hardened off before finally planting out. Although the weather has been both hot and dry, no watering has been done, bat heavy mulchinge of Mashroom-bed manure were omployed. AngloSpanioh and Lord-Keeper, too, are prized for exhibition.
The Main Crop varieties, which are grown in large quantity, are thinned bat little, and the bulbe thoroughly wedged each other is the rowa. Mr. Pope thinks highly of the Southport Red and Yellow Globe varieties, as they are deeply-formed bulbw, atrong objection being taken to those that are remarkable only for width. Walker's Exhibition is an excellent cropper; Veitch's Main Crop is an entablivhed farourite, and so is Bedfordabire Cham-
pion, and the Wroxton; the latter hat especially long balbs. Giant Zittar is promising, and o is Sandringham. Messrs. Satton's recent addition. Magnum Bonum, is flatter, but nevertheles promising. Celery cultare here in remarkibly good. The old-fashioned plan of blanching it with soil is not followed, bat aheet of brown-paper are used. The latter is much better for exhibition purposes, inasmuch as it prevent aluga injuring the outer leaves. Abundance of rich food is required to grow really good ancculent Celery in Aaguat and Sep. tember. Siandard-bearer, Laing's Mammoth, red and white, along with a dwarf-growing red variety, resembling Satton's Al, are the varieties grown.
At Highclere, extra-large heads of Caulifowert are not fayoured, mediam-nized closely grown, pare white head are those selected; Mapuam Bonum, Eclipse, and Autumn Giant, are the kind preferred. Deep atirring of the soil, combined with heary manuring, are the points to oberve in growing Caulitowern. Brassels Sprouts at the time of my visit were quite a yard high, the teme already packed with close fine head.. It is uselens to expect a fall crop of buttons if they are not formed before September is in. For the Octobar and November showa, early sowinge and liberal cultivation are the chief point to observe. Espocially good are the Carrots; they are not over-large, bat perfect in form and colour. The soil here is just anitable for this crop. Now Intermediate is the variety depended upon. So well do they grow here, that Mr. Pope drew out of the ground bat nineteen roots from which to select the eighteen ho staged at the Suathampton show in three collections. Mr. Pope grows the balk of his Tomato in a low pit in ahallow boxer, training them like Cucumbers under the glass, and amooth fruite of the Perfection type are those grown. Polegate he regard very favourably as being large enough and perfect in form, without the ugly dimple in the centre so objectionable in many varieties. Plant growing against a wall out-of-doors and at the foot of a Yew hedge were carrying very fine crops. I counted as many at two dozen fruits of Polegate upon one plant. The plante were atrong, and a good aize before planting; it is useless to have them otherwine for planting out-of-doors. Scarlet Ranner Beans are mach preforred to Kidaey Beans. To get them early, Mr. Pope nowe in good time, and grown the plante on under glase until they are 2 foet high and in bloom; they are then carefully planted in a warm site. From these plants good Beans are obtainable at the end of Jaly. Ne Plas Uitra is the variety preferred.

Among Beet no variety find favour for exhibition for the early show: like Pragnell's; and Cheltenham Green Top, or come one of the many dark-leaved varieties for later hown. Very many persons make the same mistake in growing Beet by sowing too early; the roots then grow coarse; mediam-aized, richly-coloured examplen are preferred. Amongat Cacumbers, Progrens is esteemed, being a darkakinned, straight-growing variety. For packing the vegetable to travel long distances, wood-wool is conaidered excellent, but dried phagnom moss, too, is much used. E. M.

## Vegrtables at Reading.

At the autamn exbibition of the local eociety, vegetablet are always ahown in firnt-clas form. At the recont exhibition, Mowarn. Sutton \& Sone offered valunble prizes for collection of unlimited numbers. There were four apecially meritorious collections in competition, each comprising about forty varietien, and a total of 160 dishem. The work of judging these collection* was singularly difficult and lengthy, so comparatively oven and so fine tha average. Coarmeness is rarely ween at Reading, quality dominates. The ultimate result was that Mr. Bowerman, gr. to C. Hoare, Esq., Heckwood Park, Baningatoke, was placed 1st; Mr. R. Lye, gr. to Mrs. Kingemill, Sgdmonton Court, was 2ad; Mr. W. Pope, gr, to the Farl of Carnarvon, Highclere Caatle, 3rd; and Mr. C. Waite, gr. to the Hon. Col. Talbot, Glenhurat, Enher, 4th. Literally, it was a battle of the beat vegetable exhibitor in the kingdom, and one of which Reading might well be proud.

## BELGIUM

## PLANTS AT THE ROYAL CHÂTEAU AT

 LAEKEN.Dubing a visit paid to Laeken lately, I noticed some fine seedling tuberoun Begonian, very good and rich in colouring; some of the double varieties were very remarkable. There was a charming collection of Nægelia, as well as large and fine secimens of Sonerila, new this season. Some Streptocarpus filled two stages of a house, where they were intermixed with some fine taberous Begonias in full bloom. There were some pretty new varieties of Streptocarpas from Mesars. Veitch, and those raised at Laeken are numerous and good.

An unuaal and admirable variety, which we compared to a fine Pentatemon, deserve mention. The groand-colouring was purple, the throat had a white ground with very dark and effective veinings; there was one white spot at the base of the lower mid-rib, jast at the spot whence springs the lateral lobe-in fact, the whole flower is most effective. There were many reedlings of Anthurium Andráanm with large epathes; in some the spathes were very dark, in other the veinings were very distinctly marked.

In the Orchid-house, in spite of the unfavourable season, I noted Odontoglossum Harrymam with six flower-stems; Oncidiam incurvam with fourteen floral trunes and quite 2000 buds; these branches are trained along iron wires, which trace out a royal crown; this will be very fine when in fall bloom. One Lalia (risp with a fine well-spread and waved lip, with a dark gronod, bore aix flowerateme and thirty-eight flowers and bud. Six specimens of Cattleya Rex bore altogether forty bloomsone plant alone bore ten; Dandrobium ansvissimum with many tranes; and Epidendram vitellinam with weren racemes. I noted, benides mome fine Cattleya gigas, Gaskellians and Schilleriana, I noticed one specimen of C. Mossiz with 127 flowers, and a plant of Olontoglossum Bictonenge with fourteen trases each with fifteen flowern.

## Obchids at Brossels.

In spite of the unfarourable season, I recently found in bloom at l'Horticaltare Internationale namerous fine apeciment of Phaia Hambloti and LælioCattleyas, a good Cypripedium Morganixx, Cattleya gigas, numerous plants of Catasetum Bangerothi, and good varietie of Cattleys Rex.
M. Peetera han some fine dark varietien of Mil tonis Moreliana and of M. neectabilis; the very beartiful M. Peeterai, Rchb, the M, Blanti, Peetersiana of Rolfe; the rare Dandrobium Guiberti, and a Cypripediam Harrisonianum, all greenish-yellow, very carious, bat lem pretty than the type. Ch. de B,

## GROUPING FOR EFFECT IN CONSERVATORIES.

Is many good gardens I have inwardly lamented the lack of tavte exhibited in arrangiag subjects, indoors and out, frequently involving a wate of good material, When the opposite of this is aeen, and good tante is evident, it is a plessure to record the fact. A few weeks ago I visited the gardens of Ommaton Manor, near "romantic Ashbourne," in Darbyahire, and I was charmed with the beautifal effects which were to be sen in every department. The conservatory strack me as boing an sdmirable exposition of tastoful arrangement. The structure was about 40 feet aquare, and the effect was made in the centre. There was no staging, but, on the other hand, there waremall knolla of rockwork, wo mranged over the urface as to form undalating slopes and miniature valleys. Selaginellas and Lycopotimme covered the stonen, while here and there aroue from thil mon-like carpeting, Dracmas, Coleus, Begonien, Crotons, Catalpas, and other richly-coloured foliage plante; while renting on the alopen were Fittonian, Bertolonian, Pepperomiay, with Tradescantia trailing in and around them. Standing up boldly at irregular ditancen were Palms of various kinds, and Ficus repent and
nimilar climbers covered the wall. The effect wan most pleasing, and quite apart from the usual atyle of conservatory arrangement. Oat-of-door the same good taste was evident. Flower-bed gay with Pelargonium had an ample setting of well-kept lawn, giving a soft, pleasing effect, instead of the too frequent garish display. Around the noble manaion runs an open corridor, facing the lawn, with a long serien of arched pillars. In the centre of each, and hanging from the arches, were bavket of Pelargoniums flowering profusely.

In the vineries and other houses, the abandance and quality of the fruit and the condition of the trees spoke plainly to the skilful culture which obtained at this beautifal place-the out-of-door fruit, the vegetable garden, and the herbaceous border being worthy of equal note. Mr. Bardney, the gardener there, had some very good new Carnstion in fine condition, and, indeed, the whole place is a credit to him. Rambler.

## The Week's Work.

## THE FLOWBR GARDWN.

By BAILEY WADDS, Gardexer, Birdsall Gardens, York.
BEDDING PLANT8.-Complete arrangement for the filling of beds next summer, and then propagate the plant in the proportion required. The past summer has not been a favourable one for the flowering of Pelargoniums, the heavy torms of the last few weeks have dashed the flowers severely as soon as they have appeared; but, on the other hand, single flowering taberous-rooted Begonias, Dahlias, and Pentatemons, have done exceedingly well, withstanding the raintorms and andden changes of weather. If Begonias planted in beda in the East Riding of Yorkhire during a meavon like the present one give aatisfaction-as they have done in many cases-they may be asfely planted in any other part of the kingdom. Begonias damaged by rain or winds quickly recover, and their bright green foliage accentates every particle of flower. Cattinge of Begonias may atill be pat in boxes or pots of andy soil, and placed in a warm-house or pit, and kept growing as long as ponible.

PELARGONIUMB.-Cattinge which may be taken after this date and pat in boxes or pot bhould be placed in frames or pitm, from which the glase-lights are removed. Keep them in the open air an long as possible; but if the weather becomes wet and cold, the lights ahould be placed over them, at the same time tilting them up to allow abundance of air. The old varieties, John Gibbon and Amy Hogg, are ntill valuable as bedders; H. Jacoby has not done so well this aeason; Vesuvius and West Brighton Gem are good. The toning of colours in flower-bed is ocessionally very well done. One arrangement of a long scroll bed planted with the following, and seen at its bent, was excellent:-The edging was of seedling plante of Centaurea candidissima, the next broad band was planted with Lobelia speciosa, with Honri Jacoby Pelargoniams in the centre, dotted through with white Cactas Dahlia Constance.

BEDDINO DAHLIAs have given much ativfaction; they are eany to cultivate, and they atand changes of weather better than mont plants. Cattings of the weak side-shoote may be struck in pote or boxes, and if kept growing for a time they will form small bulbs, that will be usefal in the opring, if the varisty is acarce. The show, Pompon, and Cictus varioties aro now in full bloom, and are the most natiofactory of autuma flowers for the garden or for catting parpones.

PENTBTEMON8 for summer and aatuma beds or for catting purpones are invaluable; they atand climatic changen well, and their tall, free-flowering spikes of bloom are very effoctive. Catting of the side shoote should be atruck in frames or hand-lights, that they may bo protected during the winter. Excellent named varieties ars Garge Smith, Countens of Hopetoun, The Lady, Mins Arnot, A. Fowler, President Carnot, and Fairy.

CALCEOLARIA8.-Cutting ahould be taken from the green moft growth, and pricked out ebout 3 inches apart into frames, using well-drained sandy oil. Sbade the glase with a little thin whitemash for a time. The framen thould bo kept rather clove and moist, in order to keep the catting plamp and fresh. With the exception of the rariety amplexicaulis, Calceolarias have not done very well this mearon, and many people lowt their plants in the
frames during the aevere frost, through inafficient attention in regard to protection. They should be kept as cool as possible, excepting that frost should not touch them; a good thick turf-pit is the beta place for them.

ANTIRRHINUMS for keeping through the winter should be struck from cuttinge and kept in frames, in the same way as Calceolaria. In some districh during mild winters they atand very well in the open, but they must not be depended on in this way. Some fine bed of these have been meen this meason of the named varieties.

## THE ORCEID HOUSE8.

## $B_{3^{\prime}}$ W. H. White, Orchid Grower, Burford, Dorking.

ODONTOGLO8BUM8.-No Orchidsare moreworthy of general caltivation than the New Grenadm Odontoglossuma. Most of them are easily managa, and yet sometimes they give more trouble than 4 other class; for when they once lapse into bad con dition, it requires extra care and conaiderable time to rentore them to health. One of the principal cauna of failure is over-liberality in regard to water at the root; other bad casea are brought about by keeping the atmosphere of the house alway in a gaturated condition. The atmorphere should be allowed to become comparatively dry for a few hours daring the midde of each day, so as to enable the plants to throw off any excensive moisture that may havo accumalated about them, which otherwise will prevent sound growth. Odontoglosmum, if watered like so many semi-squatic plants, will assuredly lone many roots, and generally deteriorate. When watering, go carefally over the plants, and thoroughly water those only which are dry. Especially munt this treatment be inaisted upon daring the antuma and winter month in the case of auch Guatemalan and Mexican varieties as O . nebalonm, O . Uro-Skinneri, O. Bictonense, O. grande, O. Insleayii, O. hatilabiam, $O$. palchellum, $O$. Rossii, $O$. Cervantesii, 0 . macalatam, O. cordatam, O. Krameri, O. Oarstedi, O. Hameanam, O. aspersam, $\bigcirc$ Reichenheimii, 0 Gsleotianam, \&c. Every amateur ahould maiso himself acquainted with the natural conditiona and the different elevationa under which the many specier of Odontoglossams grow, as this information will greatly assist him in fulfilling their requirements under artificial caltivation. Where a representative collection of Odontoglossums is grown, there will be some that require potting at different seasons of the year; but there is no better time than the premat for repotting the majority of the plants, eapecially varieties of 0 . crispum, $O$. Pescatorei, 0 , triumphana, O. Hallii, O. Harryanam, O. Iuteo-parpaream, 0 neviam, O. polyzantham, O. nevadense, 0 . excellens, and ().gloriosam. Plants which fowered early in the year are now growing freely, and the new breaks will be making a number of young rooth, whicb, having fresh material to grow in, will become well-established before winter commencet. A suitable compost for thene plants consiats of freshly.gathered aphagnum-moss and good fibr peat in equal proportions, to which may be added moderate quantity of small broken crocke and cbarcoal. Too mach troable cannot be taken in preparing the mose, carefally picking out all the rabbith, and exsmining every particle for amsll slugs ; this be not done, much injary will result to roote and young flower-epiken. The pote used ahould bo in proportion to the size of the plants, and overpotiting must be tudiouely gaarded againat. The pots ahould be quite clean, and be three parta fillod with clean crocks, over which a thin layer of mon should bo apread to make the drainage aecurce Pot the piant moderately firm, keeping the base of the bulbs just above the rim of thed, pot, ad when the operation in complew, over the anface. In going through the collection no doabt some plants will be found in bad healthe These should be turned out of their pots, the row well washed, and all decajed parts cut away. put the plante into pots just large enough to conit is their rootw. For few week: after repoting, adviaable to afford water paringly, giving juat sumell cient to induce the sphagnam to grow. Syriage between the pote morning and evening, and ano aff much frest air as posnible, enpecially when thoortod side temperature is about $50^{\circ}$. Odontoglossum are, generally establinb, which in partly doe to the care taken by the collectors to gather them in the proper now and to their careful packing of the planta. Eaca should be potted separately in as mall a pot almon conveniently be aned, filling ap the pot
entirely with crock, and uaing a thin layer of peat and mosi on the sarface, packed tight enough to steady the plant. After the first growth in formed, and new growth commencen, they should be trantferred to larger pots.

## FRUITB UNDER GLAGB.

B/Riceard Parexer, Gardener, Goodwood, Chichester. LATE GRAPE8. - The fine weather of the pat three week hea proved very beneficial to late Grapes, permitting plenty of ventilation to bs put on daily, and rendering but little fire-heat necessary. It is not wise, however, to diapense with fire-heats altogether, or the temperatare of the house may fall too low toward morning, which will cause moisture to settle on the berrie. Until the frait is thoroughly matured, and the atmosphere of the vinery can be kept quite dry, a elight circulation of ho:-water should be turned on the last thing at night, and at the same time a little air map be left on at the top of the house. By this means a more even temperature will be maintained, and this will greatly help to finish the berrie perfectly. The bunche should be looked over at ahort intervals, and any crowded or bad berries removed, doing the work with care, so 88 not to dentroy the appearance of the bunch. Keep lateral growth in check, that a free circulation of air between the main leavea and bunches may be obtainad. Any watering that is neceanary, should be done in the morning and during bright weather, ot that the house may become dry again before evening. If the present hot weather continue, it will be necessary to damp the house down several time during the day; but in cases whers the bunchea are nearly rips, the last damping thould be done quite sn hour before the honse is closed, to avoid any steam collectiog.

MID 8EABON VINEB.-Plenty of ventilation and a dry atmosphere must bs maintained in vineries where ripe fruit is still havging, and a watchful eye must bs kept for mice and waspe. Should any of the banches show sigus of shanking, cat the crop at once, and take steps to exsmine the roots, and if necessary, renew the borders without delay. Such work ean be done much better at this season than it the apring, when so many other matters claim
aitention, and it in a great advantage to the Vinen, as fresh roots form again quickly and no check is given to neat season's crop of fruit. Young rode that have been trained between old Vines with a view to replacing the latter, soold be exposed as mach as possible to the sun, to ensure the wood boing thoroughly ripened, particularly so if the growth made is very strong, or moms difficulty will be experienced to induce the eves to "break" evenly next apring. It is not necenary to cat out the old Vine altogether the first sesson, bat somany of the spars can be sawn off at the bottom of the Vines as will allow room for the young ones to carry four or six banches of frait next year. After the second or third years, the old Vines can be cat right out, and the yoang ones being well eatablished, a reanon's crop will not be lost.

YOUNG VINES in pots, grown from eye inserted in February, have made good growth, and may be now turned outside to rest an advised recently for fruiting canes. Water must not bo withheld undenly, but les moisture may be afforded an the foliage becomes yellow. Any lateral growth that may how should be pinched out.
strawberries in pots.-Where these were placed closely together for convenience after potting, it is now necessary to afford them more room. Look over the plants at least once a fortnight, and pinch out runners and remove side-growthe, so that only one crown may form. Keep the plant free from weeds, and water regularly. If the pota do not stand on alates or boarde, they mant be twisted round at lesst oncs a week to prevent roots forming in the ashes.

## TEE KITCHAN GARDEN.

By Joma Lambeat, Gardener, Powis Cantle, Wolshpool.
ONIONE.-Tripoli Oaions mown an advised, being now nicely, up, will be benefited by a careful boeing and cleaning of any weede that may have appeared aince sowing, and a dutting of noot thould be given them oa the approach of rain. In late diatricts, Tripoli Oaions may jet be growing, but they should now be talsen up, dried, clenned, and put away for present une. In early districts, they are probably all used up. Where Onions
are grown eapecially for pickling purposes, theme may be pulled at once, carefally cleaned, dried, and sent in for use. Sach Onion do not improve by keeping for any length of time, and should be pickled as soon as they are properly harveated. The general crop of pring sown Oaion will bs nearing the ripening period. Very large Oaion: grown for show parposes may not be quite so fine in the neck an denired, but a sharp twist close down to the balo may be given without distarbing the bulb; or better still, if time il not important, tie them tightly round the neck with a piece of matting. Ia regard to large breadths, the old method of beating them down with a besom is the quickest way, and is fairly effective. Osions for general keeping parposes should not be thick ia the neck as to require this operation. If they are left rather thickly in the lines as advised, they will havo maller neck and smaller bulbs, and among them will be any quantity of picklera that ahould be harvested by themelves. If the weather appeara eettled for hot, fine days, the crope of Oaions will take no harm if palled and laid out on the ground for a few days, placing them with the roote towards the san toripen. Afterwards dry them in a cool vinery where the foliage isfalling, and where the ventilators are open night and day. When they are sorted and stored for winter, it ahould be in a cool dry atore-room or shed, from which frost cau bs excluded. Roping Onions in long strings I regard as time wasted; bat if nufficat top atill adbere to them they may be gathered up quickly into a bundle of a size which can be readily gripped with the hands and given a tie ready for hanging up. Where Oaions are required largely late in the epring, sll the smaller-nizod, fally-ripened bulbe should be remervad for th3 purpose, as these will bs found sound and not inolined to grow like the larger and more flethy bulbe.
parsley.-The first sowing of Parsley will be getting very croxdedin the beds, and should be atripped of all the large outside growths or any yellow leaves from the anderside, so that the fresh growth may have plenty of light and sir. Planta that stood throagh last wiater here, and did
not bolt to need in the spring, are looking remarkably well. Make accanional planting from markably well. Make accasional plantinga from Look well to that sown or pricked out in frames or pits, as recommended, and wee that it does not nuffer for want of water or thinning out. Parsley may also be sown or transplanted into deep, narrow boxes, and tood outaide. If well establinhed before winter, these will be found of ave to placs in any house at dieponal, and will produce a good groxth inaide.

PLANTB UNDIR GLASB.
By W. H. Smith, Gardener, West Dean Park, Chichester.
EUCHARIS if required for flowering at Caristmar, ahould now be rested for a time, and if the plants are planged, they hoald be lifted and placed on slates or bricks. Leas water will be required at the roots, but they should not be allowed to droop. If the plants are syringed twice a day, this will be almost all the water necenary. Giva the planta a good cleaning, remove mealy-bag by porging with soft-soap and water, at the rata of tro ounces of coap to one gallon of water. A conler temperature should bs given, and toward the end of Ostober, they may bs atarted into freth growth by replanging into a bottom heat of about $70^{\circ}$.

BOUVARDIAS that were planted-oat, should now be taken up and potted irto good rich soil. Piace them in a cold frame, and keep it rather close and shaded until the roots have entered the fresh soil.
Plants that have been grown in pots during the ammer, and are fall of roots, will require applications of weak manure water two or three times a week. These plante must be taken into the greenhouse or frame before the nights get too cold.

8OLANUMs thould be potted up into potes emall as will conveniently contain the roota. Place them in a cold frame and keep clone and lightly shaded for a time; when root action hat again commenced, admit plenty of sir. Plante that were grown in pot will be afe outsicie until the end of the month.

Callas (Richardia sethiopica).-Thene hould now be lifted and placed in good-sizad pots containing turfy loam, leaf-soil, and plenty of well-decayed cow-manure. When they are potted place them cow-masure. Whe in the shade antil toward the end of the month, when they should be taken to the greenhouse. If the flower are required early, a few must be taken to the greenhouse or conservatory at once and placed in a position where they will recoive plenty of light.

CAMPANULA PYRAMIDALIS.-These plantsahoald be potted on into 6 inch poti, which are graerally large enough for them to flower in. For potting compost use good turfy loam, leaf-woil, and a few halfinch bones. Place them on athes outside, and syringe the plant frequantly. They may be wintered in cold frames, as a littlo front will not harm them.

FREESIA8 baving now commenced their growth thould receive a good monking with water, and as aoon as the note are full of root they must be liberally sapplied with manara-water. Put the next batch of bulba into $48 \cdot$ sized ( 5 -inch) pote, and cover them with a little cocos-nut fibre. DJ not water antil growth has commenced. Pot up batche of named Hyacinthe, Jonquils, Narciasus, and Tulips as soon as possible after they come to hand, especially if the fiowern are required early. A good quantity of Scilla sibirica may ba placed in larga (if)s, and they will make a very pretty edging for the conservatory stage. Lilium Harrisii End I, candidum mast also
be potted ap without delay, or the balbs will 100 n shrivel.

## THI HARDY FRUIT GARDEN.

## By W. Pops, Gardener. Highchers Castle, Newbury.

Gatherina fruit.-That care nad judgment bo exercised in the harventing of fruit is all important, or the labour of monthe to obtain fruit in the bent ponsible condition as to appearance and quality may be to a great extent thrown away. To secare wuch results, trees of choice Piums, Pesches, Pears, \&cc., should be looked over daily at this seman, eapecially in the afternoons of hot days, wuch as we have experienced lately. It will not be difficult to determine which fruits are really mature and fit either for storing or for unf, at the case may be. Taking Plams, for instance: for culinary purposes these need not be quite ripe, and colour is, of courae, immateria! ; but for dessert, not a fruit should be gathered that is not in the highest degres perfect in ripeners, bloom, and colour. Sach fruit will be proportionately appreciated when aent to table. If fruit be left too long on the trees, it is frequently insipid, and almont tasteless. Peaches are never in the best condition when allowed to remain on the trees after they are rip?, or if allowed to fall into nets underneath instead of being gathered. If these are to be packed for a jurney, they are bent gathered a disy or so before they are fully ripe, because they are leas liable to damage durind travelling. Eich fruit should bs carefully wrappeg in tissue-paper, and firmly embedded in soft, white wood-woo', placing them in single layers in shallow boxes. They may thas be ent long distances in good condition. Necharines hould never be gathered until quite tips and fit for table.

ROOT. PRUNING BARREN FRUIT-TREEB. Apples, Pears, or Plams, trained as pyramid, that may be growing vigoroualy, bat are practically barren, should now b? root-praned, in order to check sach exaberant growtb, and iadace the formation of frait-budr. Young tree may have a trench opened all round at a distance of from $2 \frac{1}{2}$ to 5 or 6 feat, according to the sizs of the tree, working well underneath, so as to sever all tap or other large roots. If fresh oil is available, some may be put into the trench, to encoarage the growth of fresh fibry roots. finishing off with the old eoil, and treading and making all firm. Make each tree at once secure a gaint high winds by three or four lengths of wire, or stout tarred string fastened to strong pegs, or cakes driven secarely into the ground at equal distances round the base, a band of come soft abatance, such as old sacking or hay, being attached to the tree to prevent injary by wire or atring. In the case of large or older trees, this root-praning ahould be ouly partially done at one time, the trench being only taken half-round, the remainiag half being done the following meason if necestary. Where the subsoll is cold and wet means whould be taken to induce rooty to the anfface, by preaerving as many av posaible and to the aurface, by preserving to
laging them in fresh composto.

Aubtralian Lemona.-A Covent Garden ala of Lemons, just received from Autralia, has attracted attention to the acarcity of thir fruit, and the capabilitien of the Irrigation Colonie of Mildura and Ranmark as Lemon-growing districts. Five handred cases were disposed of at prices ranging from $98.6 \lambda_{0}$ to $148.6 d$. per csse, which is regarded as an exceptionally good price at auction, but not fally reprementing the value of the fruit, and higher prices are confidently expected when the quality becomen known.

## EDITORIAL NOTICES.

Advertisements ahould be ment to the PUBLISEBR.
Eewspapart.-Correspondents sending newspopers should be careful to mark the paragraphs they wish the Editor to see.
Local News.-Correspondents will greatly oblige by sending to the Editor carly intelligence of local events likely to be of interest to our readers, or of any matters which it it devirable to bring under the notice of hortioulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

The Chiswiok
Vegetable Show.
As compared with previous conferenoer and exhibitions at Chiswick, notably those oonnected with Apples, Roses, Ferns, Conifers, Pinks, Chrysanthemums, and Dahlias, the exhibition of vegetables was considerably inferior, and the information elioited as to vegetables and their culture conspionous by its absence. The weather this time was all that could be desired, bat the attendance was not large.
It must be remembered that this was the first oocasion for wome years when efforts have really been made by the Royal Horticultural Society to obtain a first-olass and thoroughly representative vegetable exhibition. That the namber of exhibitors in many of the competitive olasses was not equal to the anticipations of many interented in the exhibition was freely admitted, and in this matter there was oonsiderable dieappointment. In the matter of originality, too, with the exception of a very interesting exhibition from Sir Trevor Lawrence, there was far too meagre enterprise, and one looked in vain to the exhibits from the largest and best firms for anything new among vegetables, for comething that would make an additional variety in our present collections. On the other hand, most of the vegetables exhibited in the competitive classem were of first-class quality; indeed, there was but little produce in the exhi-bition-tent that could be fairly classed as inferior. Mr. T. Wrikins, gardener to Lady Throdora Gurst, obtained the first place in the oompetition for twelve distinct klands
with colleotion worthy of the class ; and

Mr. Waite, gr. to Colonel W. P. Talbot, may aleo be congratulated on the oollection he exhibited in the olass for nine distinot kinds. Potatos were exhibited in moderately good quantity, the quality of the tubers in very many cases being quite satisfactory. The Peronospora pest has made itself visible in most gardens since the drought of the early summer was followed by showers. In the gardens at Chiswick this unpleasant fact could hardly fail to be noticed in the Potato haulms; and in gardens where a skilful and intelligent system of culture has not been adopted against the progress of disease, we fear considerable loss will be experienced among the tubern of late varieties. Naturally, however, there was no evidence of any untoward circomstances affecting the Potato, in the specimens upon the exhibition tables, and in this partioular, exhibition produce frequently illustrates in no sense the bulk of the crop outside. The Brassica section of vegetables was by no means lacking in size or quality; and this remark might be equally applied to roots, whioh we regard as remarkable, bearing in mind the climatio conditions of the greater part of the season. In another place are given full particulars of the produce in each of the classes, and we need not refer to them more in this place. It is only fair to add, however, that the great seed-growers, though failing in the particular already mentioned, nevertheless made a capital display of vegetables of all known sorts, and though the varions collections contained no really new vegetable, they illustrated practically the very best varieties and latest improvements in each type; moreover, eaoh wan an object-lesson in good oultivation. Should a Vegetable Exhibition by the Royal Hortioultaral Society beoome an annual event, and we are strongly of opinion that it should do so, there must be some readjustment and revision of the sohedule, in the endeavour to make it more popular with exhibitors, and likely, also, to produce an exhibition that shall present more educational features than did the one under notice. When this has been done, and the event has become recognised as an important one, there is no reason we know of why this exhibition should not become the best illustration of vegetables ever seen in the coantry.

The Chiswick Inepectina Committee.We understand that the following gentlemen formed the committee appointed by the Council, without the knowledge of the Garden Committee, to report on the garden at Chiswick:-C. E. SHes (chairmsn), W. Wilis (Secretary). J. Dovalas, H. Williams, H. Shlfe-Leorard, J. Willabd, E. Hill, J. Jaques, and N. A. Barnes. The Chairman, Secretary, and Memars. J. Dovglas and H. Williais, are membert of the Council, and two are aleo members of the Chiswick Board.

Horticultural Meeting at Ghent.-A certificate for cultivation and flowering (à lunanimite). was awarded to M. F. VAN Dribsschm-LgYs, for Juaticia coccinea, an nnusual opecimen, having fifty fine racemes of expanded flowers. Certificates of Merit were allotted to M. Pymanert Vas Gerbit for Dieffenbachia Fournieri, with very erect foliage, firm in texture, of a beautiful dark-green hue, all marbled with white; to M. L. Pomliman Marnhout for Vrienia Henrici, from V. paittacina $\times$ V. aplendent, a plant not fully in bloom, but already noticeable for its very long floral raceme garnished with fiery-red bracts-thia Bromeliad, by reamon of the unusual length of its flower-atem, should prove very uneful for floral decorations; to M. Pymazbt Van Grert for Tradercantia Regine, a apecies introduced
from Pera by 1 'Horticalture Internationale; the habit and colour are magnificent, leaves lancoolth, pointed, dark green, atreaked and lined with white; to M. Albebt Torffaert for Lexlio-Catilega Als dreana, a new hybrid of C. bicolor $\times$ L. elegm, obtained by M. Ce. Maron, who has dencribed itis the Revue Horticole for September 1; the flower in well expunded, measuring 7 inchen across, the wphls are from 23 to $3 \frac{1}{4}$ inches long, in width from th ${ }^{3}$ of an inch, of a delicate violet-rone tint; tha petala, of the name colouring as the repall, at a little broader, are waved along the edges. Th lip is of a shape quite new among Cattleyas, Iti recarved to the tip of the column, and showa a phan surface slightly carved back and wavy all round, of deep lilac colour with a white border at the tip; the length is $1 \frac{1}{4}$ incher, and the breadth from 1 toll inch, the qynonteme is white, and the edgen of the which it envelops are also white and open in breadth of $\frac{3}{4}$ inch. A Certificate was granted to $L$, L. De Smet-Doviver, 'for Anisogonia decumith, 1 most distinct and still rare Fern; foliage thick, is. dented, the dark green colour gives it a resemblam to a dwarf Zamia; it in a viviparous variety, of med beauty, the petioles of the fronds are covered mith bads ; a very ornamental species. Mdlle. Evaimm Goequier ottained an award for a collection of ent Cactus Dahliaw, among them were the followiag fin varietien, Charming Bride, Empress of India, Luly Montague, Juarezi or Etoile de Diable, Stanieg, Salmon Queen, Asia, Madame Burel, and Sir Trem Lawrence. Cartificates for flowering were alloted to M. F. Van Driessche, for Geenera Donkolaeri, from G. diacolor $\times$ Glozinia rabra, exhibited with about twenty fine flowers ; to M. G. de Saeahrb, for Gmvillea Preisiii, a new plant from Holland, remarkible for flowering almost continuously through the yent; the very carions flowers have narrow crooked petilh whose red and yellow colourn, they being borne in large quantities, produce a very pretty effect; to $\mathbb{M}$. Pynarrat, for hottlera hamona, a new Gemeriad []] with delicate blue flowers with a large yellow this plant, by hybridiaation, would probably prodia nome interesting new varietien. Ch. D. B.

The Barron Tegtimonial Fund.-A met ing of the General Committee of the above frud was beld at the Hotel Windsor on Treenday aftur noon, when there were present Dr. Masters (Chairman), and Messrn. J. H. Veitch, P. Veitch, H Tarner, P. Barr, G. Gordon, R. Dean, J. Lidib H. B. May, W. Y. Baker, H. Herbst, A. W. Go Week, G. W. Camminf, J. Cheal, Ranger Johnot, and the Hon. Secretaries, Menars. W. Marthall and B. Wynne. Mr. H. J. Veitch accepted the port of Treasarer to the fund. Several lettera were rell from Meares. Satton \& Sons and other persona willo ing to serve on the committee, and promining aifo port. It was resolved to publish the lint of subscribera. The amount already promined is £116 15s. A ab-committee was appointed to arrange detaila,

Stirlina horticultural societr. - Tie annual exhibition of this Society was held in the Pablic Hall on the 5th inst. There were orer 1000 entries, the increase in the entries over lat getr being chiefly in the frait section. The ratious exhibits of Grapey, Peaches, Apricota, Plama, den were of high caltural merit. Pot plants mades fine diaplay. The best collection of planta arranged on tablen for effect was from Mr. Lunt, Keir Gaddent and the 2od prize was taken by Mr. D. Airdith Larbert Houne. The winners of the extras priza for four bunches of Grapes and the Clovenford prisy lef our banches of Grapes, were Mr. W. Ruth-rford Airthrey Castle, and Mr. T. Lant, Keir, respectively. Cat flowers and vegetablen, notwithatanding for vearon, made a good display, the lot place for 1 extra prize for the beat basket of vegetables falinipl to Mr. McNaill, Gargannock House. Other prinep prize-takera were Mr. J. Carmichael, Tonch; Mrim: Waldie, Dollarbeg; Mr. W. W. Kitchie, Polming Mro A. Forguoon, Woodville; and Mro J. Kily Blairdrammond.

Australian Flowers.-The Orient a.-n. Ophir has brought from Sydneg a bouquet of Australian Lilies enclosed within a block of ice. They have been went to the Agent-Cizneral for New Sjath Wales, with the request that he will ank her Majesty's gracion acceptance of them.

Cardiff Exhibition, 1898-Cardiff is laying itself out for an exbibition on a large acale in 1896. As might be expected in a district oo intimately conrected with the cosl and iron induatries, the mining
a faciated atem bearing fifty-four normal flowera, exhibiting the bright red uncally neen in the variety, and one pare white flower in which no trace of colour is to be seen. In fact, it is \& flower of L. specionm album among a number of the red variety.

Nomenclature of Garden Plantb.-The following are the recommendation made by a committee of the society of American florist at the annual metting held at Pittebarg, Pa., from Aug. 20 to 23. 1, the priority of name hall be recognimed as
author for the same; 7, the nomenclature committen shall, in all cases, before pasing judgment fially on alleged synonymor plants, correspond with all the partie directly interested a as to get all the teatimony possible berring on the same; 8 , exception to the report of the nomenclatare committee whall be made to the secretary within sixty dayn after the reading of the report. Such appeal shall be indicated in the report of the ociety by an asteriak, and be referred to the committee for reconnideration the following day.

Fig. 54.-clematis indiviga lobata, in the conservatory cobridor at faleland pare. (see p. 303.)
and engineering sections will be very prominent. Maritime interenta will be well represented, as would be natural at a port where shipmente of coal, coke, and patent fuel in 1894 amounted to $15,316,165$ tons. Other section of the exhibition will embrace the latest developments in electricity, in ecientific inabrumentr, \&c.; while agricultare, horticultare, porte and pastimes will not be overlooked, the latter probably including a water ahow on a big scale. lepresentative men of all clasee have the affair in hand, but Lord Windsor is prenident, Her Majesty the Qurery, patron, and the Prince of Wales will be asked to open the exhibition.

A Fasciated Lilium apeciobum - In Mr. McAmthozis nurnery, Maide Vale, W., there in, at present, a plant of Lilium specionum rubram, witb
belonging to the originator or introducer of a variety 2, the names from foreign countrie thall be rocognised and used exzept those in Japanese, and to be trannlated; 3, the purchaser of anew variety from an originator can by mutual consent between them, change the name, provided the variety has never been disseminated; 4 , when the originator has sold, or consented to such change of name, he has the privilege of aning ach name again; 5 , in registering a name, it muat be accompanied, wherever posible, by a apecimen of the plant or flower, or a complete deacription of the same; 6 , the finding of the secretary of the Corysanthemam, Rose, and kindred acieties shall be considered as authority in cases of complaint or appeal, and in reported cases of plante wrongly named, not coming ander the head of the above societies, thil committee shall give the

A Manure Heap Burnt.-Conaiderable excitement was cansed at South Esling on Sanday afternoon the lat inat, by the audden breaking out of fire in a large heap of manure of aboat seventy losde in the market grounde of Mr. Ronnss, in Gannerabury Lane. The Hounslow branch of the Diatrict Railway runs through the grounds, the railway being crowed by at archway. It was on thil arch, but at a distance of 20 yards from the railway, that the heap, consisting of ordinary atable-dung carted from London, had been placed, and it is believed the fire originated from spontaneous combution. The heap was about' 7 yard in length, 4 yard high, and correapondingly broad, and when the fire was at ite fiercent the heat was intense. Eventually the fireengines were brought to play apon it, and the fames were mbdued, though by the frequent bresking into
flame, there was no doubt a large body of fire within, and water was poured on to it throughout Sanday night. It is underatood Mr. Robins' lons is covered by insurance.

The Society of American Florists had just held its annual meeting at Pittebarg with great anccem. We have nothing like this great ociety in this country, although anch a one might bs inaugurated without mach difficulty. Next year the meeting is to be held at Cleveland, Ohio, under the previdency of William Scort, a florist in Baffalo. Mr. Scott is a mon of Alexander Scott, gardener to Sir George Staunton, at Leigh Park.

Stock takina: August.-The figares representing the trade of Eagland during the past month-imports and exports-are of a satisfactory character. With two exceptions, imports are all in favour of "our side"-the excess in value over the ame month last year baing $£ 2972,781$-the deficit for the eight months past, compared with the same period last year being represented by $£ 1030,524$. Oar export trade shows a ready response to this, and it is worthy of remark-if it be only repetition-that those whose trade with us belps to increase our balance, themselves find their home trade and trade prospecte all the bester for the improved figures. Taking into account the social condition of nations, our Trade and Navigation $R$ ztarns, asy, for the past month and eight months, offer a problem, the colution of which cannot but prove of value to such an can demonstrate the valuen submitted by the officials of the Board of Trade. Take the following excerpts from the "summary" table of importn for the month of August:-

| Tmports, | 1894. | 1805. | Difference. |
| :---: | :---: | :---: | :---: |
| Tutal value of imaports | $31, \boldsymbol{x}_{88,521}$ | $\frac{\mathcal{E}}{34,611,305}$ | $\begin{gathered} \mathcal{L} \\ +2,972,784 \end{gathered}$ |
| (A.) Articles of food and drink - dnty |  |  |  |
| free ... ..e ... | 11,903,4.6 | 12,514,364 | +605,938 |
| (B.) Articles of food and drink-dutiable | 1,801,632 | 2,306,484 | +504,882 |
| Raw materials for textile manufactures ...s ... ... | 2,418,420 | 2,834,508 | +388,088 |
| Raw materialy for sundry industries and manufactures ... | 4,312,360 | 5,080,190 | $+537.830$ |
| (A.) Miscellaneous articlea | 1,133,008 | 1,215,758 | +83.755 |
| B.) Parcel Past a. | 71,779 | 73,130 | +1,351 |

It is worthy of notice that some journal are now laking atock of what the foreigner applie us with in the shape of "food"-almost an if the figures constituted the record of a new discovery; and no we here reproduce our unal excerpt from the general figares relating to the imports of fruite, roots, and vegetable:

| imports. | 1804. | 1895. | Difference. |
| :---: | :---: | :---: | :---: |
| Truite, raw :- |  |  |  |
| Apple .ow .o.bush. | 338,310 | 192,320 | -145.790 |

The lewon: convejed by thene figures have sooften been stated or "black-boarded," that further notice would be aurplasage. Jat hore, it may not be unfrom "litule Guernee" items concerning our importa featares of interest "-an inland postensing many flowers, vegetables, for our home growers of fruit, 36,000 inhabitante, there are not that with about pervow Who grow crop for exportation-m 1,500
sway hundreds of thousand of packagem yearly, and returning a gros income of more than $£ 500,000$. The chief crops are indoor crops of Tomatos, Grapen, French Beans, Melons, and flowers; of outdoor crops, there are carly Potatos, Broccoli, and flowers. Of these productions, Tomatos are the most important. In our last Stock-taking, deserved prominence was given to light railway as one of the remedies for the relief of agricultural depression; it is interesting to notice now that thers is some prospect of the commencement of the proponed Chipstead Valley line, the "bill to enable" having been passed, and the Board of Trade having been communicated with for power to construct the line, with certain modifications. The cont of the line is about $£ 60,000$, or $£ 10.000$ per mile-we heartily with the cheme succest. Road locomotion is also interesting the Institute of Engineert, who invite papers in competition for prize on the subject of motors, electricity, mineral oils, compressed gam, \&c.; and it may not be inopportune to draw attention to the experiment made mome thirty jears aince in the manufacture of gas from all sorts of vegetable refuse. These are carried on in London, and may atill be remembered by some of our interested readers; the Great Eastern Railway Company are now using a modification of this syatem. On the whole, the subject of light railways and road locomotion al adapted to the wants of tillers of the soil eems to have taken good hold. The aubject of

## Exports

for the past month in a very interesting one. Here the figures thow an increase of $£ 1,900,255$, the figure being for Augurt, 1894, £ 18581,240 , as against $£ 20.481,495$ for the month jast cloved. All items show an increase with the exception of animals (living) $£ 10.813$, and of $£ 10,694$ in machinery and mill-work. The excens in value of exporte for the past eight monthy of the year is $£ 3,295.246-$ that is, $£ 147,158,497$, againat $£ 143,863,251$ in the corresponding eight months of 1891. In all this we see an incentive to activity in the home trade, which means an increase of employment and promperity among the workern.
"The Botanical Magazine."-The plante figured in the September number are the following: -

Helianthus debilis, Nuttall.-Thin is the asme plant as figured by us, 1895, i., p. 167, f. 21, as H. debilis var. cacamerifolius. Sir Joseper Hooker unites H. pracoz also with this specien. It is an annual plant, which doen well in bed in the ammer; t. 7432 .

Rumex hymenosepalus, Torrey. - Thin in the Canaigre plant, which is uad for tanning parposes, the root being the part used. It in a native of New Mexico and Arizona; t. 7433.

Cleyera Fortunei, Hook. f., in Gard. Chron., 1895, i., p. 10 ; t. 7434.

Atraphaxis Musohketowi, Krasenov. - A hardy Polygonaceoul thrab, with glabrous, Ianceolate leaven, and terminal many-fowered racemen of amall piokioh flowera. It is a native of the Alatan Mountainn, t. 7435.

Richardia Rehmanni, N. E. Br. See Gard. Chron, 1893, iio, 564 , nub nom. R. Lehmanni ; t. 7436.

Edingurgh.-A splendid how wa, held in the Waverley Market on September 11. There were over 2,100 entrien, about half of them in the fruit clases, but we are unable to give a detailed report
n our present imue. n our present isuce.

Cheshunt, Wormley, and District Horticultural Mutual Improvement Society. The fortnightly meeting was held on Tharaday, in St. Mary' Hall, Chemhant, Mr. Georae Padl prenided. Over 300 member were present to bear Mr. James Dovelas, of Great Gemien, Ilford, give an excellent lecture on "The Carnation." Mr. Dovalas gare a thorough deacription of the Carnation, of it origin, and of the progress the plent has made up to the prosent time. Ho then dealt with ite propa-
gation by seede, layering and cutting, the most nith able moil, the flowering period, and cloned with some remarks upon the classification of Carnation and Picotees. D aring a short discuesion, Mr, Gronem Padl alluded to the practice of dreming the blooms Mr. W. L. Yates referred to the gout diemm attacking "Mrs. Reynolds Hole," and the faggoid direase upon the Malmaison section, two dineant for which there is no remedy known. Mr. Dorach, having replied to questions pat to him, Mr. Josere Rochford proposed a hearty vote of thanks to bila for his interesting and instructive paper, which wu carried unanimounly. Mr. Thomas Rocaford wh thanked for sending decorative plants to adorn the hall. The next meeting will be held on Thurudy, September 19, in the Taraford Coffoe Room, when Mr. J. Fiabss, of Hertford, will deliver a lectare Dahlias.

City Corporation Marketr.-It har bem thought for some time past that " omething mu about to be done" with the vegetable and fin markets attached to the Central Market in Was Smithfield, and the other day it was announced by the daily Press that both of these were to bo abolished. Some outsiders had come to the cenclusion that the Corporation had been offered a pries for both sites and the buildings thereupon afficient to recoup the capital expended. One market no port saya:-"Fiom the City head-quarters I ham received information that no decision whatever ha been come to respecting the two markets, though the matter has been under discasaion by the come. mittee-probably nos for the firat time in the par two yearn." It would be a pity, in the interest of the public, that anything ave "improvement" chould interfere with the markets in question.

A Vegetarian luncheon.-At the Vegetable Show on Tuesday last, at Chiswick, a novel and interesting, we can scarcely asy eatisfactery, feature was the lancheon. We append the menu, wilith may be of interest:-

MENU.
2s. 8d. a head. Entrees.
Vienna Pie and Bretroot.
Mushroom and Potato Patty, Greea Peas and Mint sham. Haricot and Egg Pie with Salad.
Lentil Sausage Roll.
Melton Mowbray Yie and Pickled Wainuts.
Savoury Patty and Mired Pick!es.
Salats.
Tomato Salad and Mayonaaise Sauce.
Mired Salad and Egg.
Cucumber, Beetroot, Lettu:e, Waterercms, Radistur, Celery and Tomatos.

Cherse.
Cheddar, Gorgonzola, and Stilton.
SWEETS.
Red Currant and Apple Pie.
$\Delta$ pricot Tartlet and Cream.
Damson Tart.
Custard Tartlets.
Blanc Mange and Fruit.
Jellies.
Boiled Cup Cuatarde.
Stewed Apricots.
Pineapple.
Plams.
, Bartlett Pears.
Black Carrants and Raspberries,
Fresh Fruits, varions.
Sundries.
Fgg and Tomato Sandwiches.
Cheese Bandwiches.
Rolls, Biscuits, Butter, Cherry Cake, Sultana Cake, aud Seed Cake.
Ten, Coffee, Chocolate, Lime Juice, and Sols. Home mado Lemonade, Egg and Milk, Milk, and Kops Ale.

## Neaplititan.

Ices.
The Kent Champion Belt Competition The Challenge Belt offered by Mesmrn. H. Canyrita Sows, of Swanley, to the A mateur or Cottage Gurden Association in Kent, who can show the bet arim of vegetablea, has this season been won by the wh met Society from the Society at Rodmernham, who ha held it during the pant year.

## CLEMATIS.

Anong climbern, none are more uneful or more beautiful than the pecies of Clematis. This week we give figure of two of the most useful. The one, C. indivisa var. lobats, in a New Zealand opecie with evergreen foliage (see fig. 54, p. 301). It is admirably adapted for conservatory decoration or for cus flowers. It makea an excellent plant for covering pillais, or for any other purpose for which greenhoase climbers are required. Bat the ases of this charming silverywhite flowered plant do not end with it atility
C. montana is hardy, and has deciduous foliage. Nothing can be more beautiful as a trailer to cover the fronte of houses (see fig. 55). A country village we passed through last apring bad almont every house completely draped with this plant, and the profation of white atarry bloom formed a floral picture, the magnificence of which it would be hard to excel. It does mach better when allowed to ramble at itw own discretion than when cut back or formally trained. The illastration we give is of a plant covering the porch of the renidence of G. Ratcliff Steel, Eisq, at Bexley.

Fig. 55.-clematis montana, hardy creeper, on the besidencr of (f, ratcliff steel, esq.
as a climber, beatiful though it be when no employed, as will be seen by reference to our illastration. One of the beat usen to which we have seen the plant put was an a decorative subject for the table. They were grown in 6 or 8 -inch pots, and were kept well cat back to hard wood, which was trained round stick to form a bushy head. When $s$ grown, they are beautifal object for the table, or for indoor and conservatory decoration, the profuion of white flower: carried well out from the bright green foliage having a charming effect. Then they may bo used for growing in baskets for hanging in lofty conservatories. For thi purpose it requires to be treated the same an if grown in pote, the length of the atem being restricted, but an many of them as ponible encouraged to droop over the barket.

## home Correspondenoe,

THE BLACK RASPbERRY. - In your isvue of Jaly 20 you allude to the Black Raspberry, or Black Capa, as we call them here. The improved varietie are grown by huadreds of acrea sll over the northern United States. The fruit is dried in vatt quantities when the price runn low, and in its dried atate it mesta with a great demand in sections of this country, suchas mining or monatainous districts, where ordinary fruita cannot be grown. Erery hounekeeper here appreciaten them for canning, and uses from 1 to 3 bashels for this parpose, and he mast be an epicare indeed, who could not enjoy it rich, full flavour in pies. or at canned fruit at the tem-table. I enclose you particalare of a newly-iotroduced variety. The cut wai made from a photograph, the
accuracy of which I can rouch for. The cut ahow the original bash, which is nine yeara old from seed. The plant is over 9 feet high, but was much higher before the fraiting-cane were cut back. Ifs fraite are large, and of a dull parple colour. Mr. T..T. Thompan, the ownar of the plant, commenced gathering the fruit thit season on Jaly 8, and gathered coutinuoutly (Sundays excepted) until Augut 12, a period of five week. Mr. Thompan, who reaider at the village of Oseida, N.Y., sold hil frait as fant as picked to a gentleman, who dittributed it to the neighbouring townand villaget, receiving as comminsion 1 cent $=$ one hall-penny per quart for handling. Think of this percentage, you fruit growers of Kant; do you get such concientious middle-men as this one? The fruit has netted the grower nine and ten cent per quart (42d. and 5 D .), and nomething like 40000 quarte have been wold this aeanon. The original plant in 1893 bore twentyeight quarts of fruit, certainly a large crop for one plant, however large. John Charlton, Rochester, N. Y. U.S.A.

WHITE WARRINGTON GOOBEBERRY. - Not unccmmon in private garden near Aberdeen; and at least two of the leading nurserymen there have it in atock. Deil.

THE BEST SUMMER DRINK. - It it not nufficiently known, that of all the varietie of beveragea, which inclade ginger-beer, lemonade, Nettle-beer, \&c, there is none equal to that made from the poorest and worst of the windfall Apples, and it can be made at a cost of about one half-penny per quart. Boil the Apples in water to a pulp, any quantity, from 1 to 2 lb . per gallon; add augar to taste, ferment with yeast in the uanal way, and bottle. It is ready the day after bottling, but doen not remain at ita bent for many days, and for thim reanon mall brewings are preferable. Use the Apple which are worthleas for any other purpose; the experiment may be made at a cost of twopence, and once tried, it will become a permanent practice. Where honey in plentiful, it is preferable to sugar; but the fermentation with this is very active, and atrong bottle must be used. Thos. Fictcher, Grappenhall, Cheshire.

WIGTARIA CHINENAIS, - I cannot write with authority of any other epecien or variety. But haviog seen and handled some fine apecimens of the above, I deaire to thank "W. J. B." for his very informing article (pp. 237, 238). We have no hardy climber of equal naefulness and merit, and it is so perfectly hardy as seldom to be injured by auch frosts as we had in February of this year. In fact, it seem rather to like frost than otherwise. I have never seen the Wistaria more heavily laden with blossom than this jear. Daring the seaton I have seen ome plants clothing an area of 400 equare feet or more, one mass of bloom, the only trace of the bitter cold of Febraary being that the foliage wat lighter and morescant than uanal. These amptoms of punimment, however, pased away as the numer advanced, and now, early in September, the plant generally as verdant as anasl, and even more thickly furnished with autumn bloom, which has been abnormally plentiful on mont of the larger plant all through Augast. In not a few gardens the second bloom is more valued than the first. It lasts longer, the racemes are shorter, more slender, and frequently intermized with leave and graceful branchlete, choica admirable material for indoor furnishing, an well as for chante effect over houses or in landscaps. Neither does the recond blooming which seems quite natural to all the finer apecimens in the open air appear to idjare or weaken the stamins of Wistarias, or aenvibly diminish the profusion of the first bloom. If it did the latter, the second harvest of beauty should atill be welcomed. For if the Wistaria has a fuult it in thes the first blooms cannot be fally seen for the crnsh. For telling pointe on walls and arches the longth and beauty of the racemes have been much enhaveed by a timely thinning of the crowded flower-buds. In addition to the normal type, W. sinencia, I have tried the white, the double, and the variegated-leaved varieties of the ame. The latter is what gardeners call miffy, and eldom grows well. Following the rule of to many variegated plant the more variegation the lese growth, the more green the more. There in auch a pleasing variety and play of colour in the normal leaven and branchlets of the Wintaria sinenais, that the plant could hardly be improved by the asoumption of ailver or golden variations or variegations. Ponsibly the plant think so aleo. and for this or other less simple ressons, call a halt to growth when arrayed in new livery,

The white variety seldom or never grows, like the so-called blue or parple. This seems singular, bat so it in. Had the leaver been white, or always paler than the common form, we might natarally have expected a more weakly growth, and fewer flowera, from the redaction of the aupply of chlorophyll. But we hardly look to the flowers as greatly adding to or dedacting from the vital soarce of vigour and life Then, again, where the leaves of white Wistarias are paler than the parple, it must not always be ausumed that they are so in virtue of their white flowers ; for, as alresdy stated, there is a wide play of colour on the leaves of parple-coloured Wistarias, The weaker the plant, from whatever canse, the paler their leaves. Hence, it appears as if lack of strength were as potent a bleacher as lack of colour strength were as potent a bleacher as lack of colour variety of Wistaria sinentia never, so far as my experience goes, covert anything approaching the sams area as the common coloured sort. Has any reader of the Gardeners' Chronicle ever seen a white Wistaria in England covering an area of 200 feet, or doable Wistariae of any colour rivalling the single one in vigour or amount of growth? With the single advantage of preserving the bloom longer, the doubling of the blooms of Wistaria is a doubtful benefit, and robs them not a litile of their grace and beanty. Permit me to say in conclusion, that the Scotch Laburnum is the best pair and prop for the Wistaria sinenais; these two planted in good soils giving e most artistic account of themselves on lawns or in landscapes. The only objection to such matchings for effect is the disparity of life between the two. For while in our climate the common Wistaria will live for centuries, the Lsburnum is comparatively ahort-lived. It will live mach longer, however, and bear up the additional burden of ite beartifal companion all the better if the seed-poda of the Labarnam are picked off soon after the flowera fade, D. T. Fish.

THE FRENCH CLIMBING BEAN.-"H, E," at p. $272^{3}$ states:-"It is a pity the Frait Committee, \&ce, thould have raised the question as to whether Mesarn. Veitch \& Son or Mesers. Sutton \& Sons have the prior claim to the name of this Bean." I beg to state the committee have done nothing of the sort; the committee decided that both were identical-that much was within it powers to determine. As to the rightful name, the committee have nothing to do. That may be or may not be a matter for the Council to determine; but the Frait Committee neither raised, nor considered it bad claim to raise, such a question. A. Dean.

THE R. H. B. AND MR. BARRON. - The treatment (good or bad) which Mr. Barron has received from the Council of the R. H. S. is the leading topic of discussion just now at every flower show, or other place where horticultarists meet, and the expresions of diaguest at the way in which the "retirement" of Mr. Barron has been initiated, and is apparently to be accermplished, are neither fewnor complimentary. As a Fellow of the Society of zome years atanding, and a steady supporter of the good work it has done in recent years since Chiswick began to be renovated, and the valuable experimental and "teating" work carried on there with such remarkable diligence, okill, and success, I regret exceedingly that the fair name of the Society ehould be mixed ap with auch an unpopalar deed as the Council has committed. The plausible letter isunad by the Council laat week, and now going the rourd of the paperi, has only made matters worse, if which Fellowe snd the gardening of the points Which Fellows, and the gardening fraternity, are good it is likely to do, it might asw, well been foft the written, or at least anprinted. What we want to know, withoat any ambiguity, is (1.) Who initiated (2.) Who were Mr. Barron, and for what reason? (2) Who were the "committee" of experte who inspected Chiswick Garden and the work carried on there, and what was the natare of their report? and (3.) What benefit that Council think the society will derive from the transaction should their ends be accomplished? A plain anawer to thene quastions, without further beating about the buth, will prove far more raluable to the Fellows and supporters of the aociety than any such vuave Seotland, September 11, 1895.

The correapondence in connection with thin circumatance in recent insuen has drifted into an actempt to draw comparisone of the work done at to your correapondent, "Head," with, sccording
magnitude, importance, and the necemsary qualifications for control and direction, the private garden comes out an easy first. There are but few gardeners, now-a-days, so ill-informed as not to know that the great dissimilarity of the work, both in anbject and detail, at once prevents any fair comparison being made, and the attempt to do so, fairly or unfairly, only shows ignorance, indeed, to me the whole tenor of "Head", letter is obviously one-sided as to give one the impression that he is a man with an "axe to grind." What is the regalar routine work of a private garden, to a gardener any way, in compariaon with the every-varying, ever-widening, pystematic and scientific operations-I nearly said fads-of an experimental garden, as Chiswick in now recognimed

Hundreds of these experimental trials, \&c., are yearly made and carried out with the greatest exactitude, and the whole recorded and tabulated for future reference. Irrespective of all this, there is also, I am torry to admit, an immense amount of routine work to be done, afficient to tax the abilities of many of our best gardeners. Under the yatem upon which Chiswick was atarted and is carried on, this routine work could not be diapensed with, but we are now within a measared distance when at least one-half can well be avoided for the future, to the adrentage of the gardens and to all tho interented in their welfare. The Council has now determined to introduce radical change in the administration and organisation of Chiswick Gardens and its work, and thil announcement will arely be hailed with the keeneat atisfaction by every trie horticultarist in the country-this much we gather from the letter from the council, see p. 270. Butwhy, may I ask, was this letter o long delayed? Had they "in the early part of this year," whon these changes were determined upon, pablished the fact of their intended introdaction, much discussion and no little harsh feeling would have been avoided, and one almost feels that their tardy recognition and admission of Mr. Barron's devoted services was only made in consequence. However, all's well that ends well, and so long as the gardening public know that the new arrangements have been carried out in a apirit of friendship, and of this we have the ammurance both of the Coancil and Mr. Barron, all will be atisfied. In corclusion, then, let as hope that the reorganisation of Chiswick may be on the very broadent lines for the advancement of horticulture. In it adminittration heretofore Chiswick has been too conservative -too seclusive. There are some countrie from whose book we bhould not hesitate to take a leaf, and that of Franca farnishes na with a model for what Chiswick should become-a national achool of horticulture, with a curriculum equal, at least, to that of Versailles. The nucleus of such a school already exista, although admittedly of amall extent: but in these days of cheap land this should prove but a minor obatacle, to be overcome at will, with many posible fature advantages. Such a school thould be recognised and subsidized by the State, for in no other countryare there mo many outlet for really clever acientific men, in positions which at present are mostly filled by foreigners. One more word, and this with respect to the alary the Council is offering to Mr. Barron's anccessor. As the possibilities of Chiswick for good are almost infinite, $£ 200$ per annam without a house is an inaufficient alary for a thoroughly qualified man, and as the days of mediocrity are past in men, so they should be in alarien. They will therefore do well to increas this to $£ 300$ per annum, or $£ 250$ and hoase. Introapector, England.

As Fellow of the Royal Horticultural Society of London, I have read "with aurprise and regret" the half-hearted and ambiguoas apology published by the Secretary by order of the Conncil. An an explanation it in lamentably weak, and obscure the main point by introducing questions of Conncil weat which most of at are agreed. The Council were perfectly within their righte in deniring
to remove Mr. Barron or any other on to remove Mr. Barron or any other of the paid officials of the Society; but the method adopted were to undignified, and so unconstitutional, as to have excited much distrust, and to have caused serious apprehensions to arise as to the fature proper conduct of the Society'n basinen. Not only ham the Chiswick Board been ignored, and so ar innalted, bat all true British gardeners and basiness men believe that mome amount of injuntice has been meted out to Mr. Barron himself, alter his long and honourable service on behalf of the Society. Something very much of the nature of a necret conspiracy appeare to have been
to have been drawn up and aigned by the followime members of Council and others, viz:-C. E. Shes (Chairman), W. Wilks (paid Secretary), H. Solfa
Leonard, Jame: Douglas, Harrv Williams, J. Wif Leonard, James Douglas, Harro Williams, J. Wil lard, E. Hill, J. Jaques, and N. A. Barnet. Thn Council. in tendering "a frank expression of regro" to the Garden Board for having ignored their ver existence, seem to forget that something
in due to Fellows of the Society, and to in due to Fellows of the Society, and to gardem generally, who are now asking all norts of que. tions about these unbusiness - like proceeding The Council have really done one of two thion -they have either been honest, and courtem and above-board in retiring Mr. Barron, they have been anderhanded and indiscreet, arenil not actually discourteoas, to an old and loni official, and also, through him, to gardem generally. We wish to know the truth, the whe trath, and nothing bat the trath of this misenh affair. It is a principle that is involved, a not in any way a merely persoaal matter. Whan the report that was drawn ap and aigned by thom whose names we have given above? If it is oot forthcoming, confidence in the society, and its convel and secretary will be most seriously shaken, Lh the council direct the secretary to lay the whole thing bare; if they have done the right thing in the best manner, they have nothing to fear, but if them has been anything discourteous, or of the nature of private intrigue, then let as judge on the dinet evidence-not to produce or pablish the report and correspondence-at once, will only defer the trobble until the society's annual meeting. Sarely the Royal Horticultural Society of Eogland has no noed of a hagger-magger policy-the society must be liko Casar's wife-and to risk its power for good, by not allaying the diacontent now raised, would bo nicide in the extrems. F. R. H. S, Ire'and.

RU8T" IN BEGONIA8.-Having charge of m extensive collection of Begonias, I have found con siderable injary caused by the co-called "rak" mentioned in your last issue by Mr. W. W. Shent at p. 268. Like him, I have heard it attribated th a fangus and to excessive moisture in the howe Neither of these reasons appeared to me to be ative factory, and a close examination of injured plath has revealed the presence of large numbers of whits insects, barely visible to the naked eye. I beliere these to be the cause of the mischief, and have fona frequent famigation to be the only effectual remedy. I agree with Mr. Sheath that too high a temperstin 0 in spring in favourable to the rapid spread of thin terrible pest. Unfortanately, it is not confined to Begonias, as Achimenes, Eranthemams, and other plants frequently suffer in the same manner. W. $K_{0}$

THE BERMUDA LILY.-Between 1878 and 1888 the enquiry for balbs of Liliam longifloram from merchants who trade with Bermude, way so grean that it taxed the resources of both Holan ame Japan to apply the needs of the Island. Can nombl
one tell as if the produce of these heary annul consigaments ever left its hores bearing the asm name? Mr. Bull, of Chelses, was, I believe, the first London house to make Liliam Harriaik noon here, and directly our large market growers toor a it, several balb firms obsained it extensively, asem the demand has been maintained until the prean time. This year, however, a mart amad and planteman has initiated a ayndicate in Bermada, abouf the combination is strong enough to control a fhet ninety per cent. of the past seasons crop. are anccessfal, a nice haul will be landed in in mind montly from this country. When it is bion in that Bermuda is a British possension, is man.

THE CHIawICK TRIAL8. - In reading an secone at p. 234 of the amount of time at Chiswick, one is tempted to sus in at sll needfal for such a garden to eag trin in auch work, eapecislly meein are practically of
or to the trade. trade. It in a well-known fact by themetres to a few well-knowa and if you picts by themselves or their neighbours; and up promicuously any nurseryman's catalog trials they rely upon, but the trials gardens and preas notices, at proved overy page. Many gardener receive applications to teat garden inecticides, \&xc., than they can entertain. sense or reason is there in encumberig , with the labour of proving the heights, colout
of flowering, \&c., of 500 Phloxer, and a proportionste number of common garden vegetable and plant that are hardly ever heard of afterwards? There only two varietie of Phloxe in cultivation, and about two dozen of thene embrace the bent. I asw them all set out in a small patch in Dobbie's nursery at Kotheay the other das. Are there not plenty of abject of far more permanent interest and importance in gardening to prove than seedmen'a noveltiep, and which would cost about a much time as it would do to write the labels for 500 Phlozes alone? It has often cccarred to me that there are many long-diapated matter of cultare, \&ce, in horticulture that an experimental garden might aet at rest by a very little patient experiment carried out conscientiously, in a philosophic and acientific spirit. For example, the kind of soil, texture, and depth, \&cc., for a Vine border is a queation still ansettled and wrangled over, notwithstanding Chiswick opportanities. The "turfy fibre " theory is the most popular atill, but it has never been demonstrated that sach a border is any better (if as good) than one made of good garden soil judiciouly enriched. Yet the tart border has cost, in handreds, if not thousands of gardens, probably 70 per cent. more in cash than as good a border of common ail would have cost, and I am atrongly of opinion that a large portion of that 70 per cent. hes been lost-sacrificed to "rule of thamb,"-and that Lindley was right forty years ago, if not more, when be aad that a "fiaely divided noil" wae the beat for Vinen, so long an it was permeable. Nambere of other problems, involving mach time and expense, might be suggested that an experimental garden might concern itself with, leaving the least important, not to say frivolous, mattersalone. Bat to carry out such experiments succesafully it requires a mind open to conviction, and with a Darwinian bent of inveatigation. I would further suggent that if, as is said, some of the glass-housen are "white elephante" on the Society's hands, and Grapen hardly do more than pay expenses, it is not necessary to waste fuel at a high price on them. There is work which they could be devoted to in the cultare of other kinds of froite and trees that prefer a cool etructure all the jear round, and with these namber of urefal test could be made that require little trouble. Head.

PRIzEs AND POINT VALUEs.-It ia a generally held that the award of prize: at flower show to exhibits according to their respective values is the right and proper thing to do, that it seems odd the principle is not generally adopfed. Two things, however, will tell agaiat the adoption: firte, ordi nary practice which regulates prizan arbitrarily and without real regard to the relative merits of the exhibits to each other; and second, the laissez faire principle which so atrongly dominates flower show management, and sanction the continuance of an old ayatem as the best, simply because it is an old and atereotyped practica. At the annual bank holiday show, held at Carshaltoa, Sarrey, Mr. A. H. Smes very kindly originated, and there is now continued, a apecial class for nine vegetables, open to all sabacribers in the district, the prizos bsing a lump sum of five pounds, which, if the competition be large enough, is divided into six. The collectiona are all atrictly pointed, number of marks given being rigidly in accordance with quality. At the recent show there were eight entries in the class, and when all were jadged, it was found that the first mix atood an follow, $61,57,55,49,49$, and 46 pointe, the gradations in quality being in no case very wide. As a reault, the five pound was apportioned into six prizes, thus, $198,4 d_{0}, 178.11 \mathrm{~d}_{\mathrm{o}}, 178.4 \mathrm{~d} ., 15 \mathrm{~s} .6 \mathrm{~d}, 15 \mathrm{~s} .6 \mathrm{~d}$, and $14 s .5 d$., these num bearing an exact relation to the point-value of the exhibits. Had the money been apportioned under the ordinary rule, £2, £1 5s., $15 \mathrm{~s}, 10 \mathrm{~s}, 6 \mathrm{~s}$., $4 \mathrm{~s}_{\mathrm{o}}$, the first collection woald have been awarded 20s. more, and the sixth 11s. 6\%, less, A. D.

JUDGING AT FLOWER SHOWs. - I notice in your answer to correspondents in jour last issue an answer to a question on "Jadging at Flowermown." Kindly allow me to say, I imagine you have been mialed on the nabject. Inatead of a group of plants in pots, the schedule provided for a group of planta for effect, which I contend alters the cave altogether. Esch group was given a apace of 10 feet by 6 feet, or ite equivalent (a circle), the centre of which was the tent-pole, which, of course, had nothing to do really with the group, bat in two case the poles zere furnished so as to give the group a more raished appearance. I think the pole could have been furnished with anjthing-any, cut Bamboos, Iry, mons, \&c.--or left entirely bare, without disqualifying the exhibit. Judge.

CUCUMBER LOCKIE'S PERFECTION.-There gre two houses of this Cucumber in the St. Neot's branch nursery of Messra. Wood \& Ingram, of Hautingdon, the plants having been put out in the end of May. One honae is 100 feet by 15 feet, the amaller 20 feet by 15 feet, and the plants are in boxes formed of planks 1 foot in depth by ame 2 feet in width. The plants atand 4 feet apart in the bozes, and both houses being span-roofed, they are trained up the invide; the depth of soil in which they are growing is aboat 9 inches. What atrikes the viaitor is the admirable condition of the plants. and the wonderful crop of fruit they have produced. It is not too mach to say that a record for produc. tivenas is established; the crop is enormous, and every frait is true to shape, ahowing the fine quality meen in those, the raiser, Mr. Thomas Lnckie, bas been in the habit of exhibitiog. Mr. W. Ratchelous, the foreman at the Sb . Neot' nurery, biated the planto were in good yellow lom enriched with manure, that a little of Beeson'm plant-manure way placed in the soil, and some of the manare with a little most laid on the aurface once a week sad Watered-in. It doe seem at it no variety of Cacamber could be more productive, and no Cacamber be better adapted for market and exhibition parposes, R. $D$.
venidium calendulaceum.-I have baen looking in vain for the year in which thi charming subjoct wal iatrodaced. Ia flower-sed liets it is genarally classed as an annual, and treated in that way it in a delightful garden plent during the summer month. S sma seeds s 0 wn in March in a cold frame, or better still in a geatle bottom heat, will give plant which, if they have ordinary care, will flower in Jaly, and if not allowed to seed will bloom for a consider. able time. Then a sowing whould be made in May for late anmmer and artumn-blooming; and like the Gassnia it is seen atite best late. The flowers are golden-yellow, with a dark brown disc, and it may be appropristaly likened to a glorified pot Marigold. One of its chief feacares is its freedom of bloom. I find it doss best whea planted out in a sunny pot, bat it should $n$ nt want for water. In the somemhat firm esady lomen of the Bedfont seed ground it roots freely, and the plants grow into large siza. $\mathbf{A}$ few ynd ofared it at a high price per packet, and I hava often wondered it he realised a fortuae by doing *o. It well deserven to be more generally grown. R.D.
heuchera banguinea ano hybaio.-Complainte are frequently made that this plant does not flower freely, but nothing could be more astiofactory than its conduct in my garden. It mutt, however, be renewed frequently from cattinge or eed, which ripens plentifally; and exposed situations, awept by cold wind in winter, mast be avoided. Whilet giving it the fall sdrantage of the mid-day sun, it abould be acreened by a wall or hedge on the north aide. In sach situations it flower abandantly, and never more abandantly than last spring, in spite of the aevere winter. I have a variety of a deeper and brighter red than the type, bat it in difficalt to im . prove the pura and distinct colour of the flower as first distribated. Last year a hybrid seedling appeared epontaneously in my garden, more robast than the seed-parant, with flesh-coloured flowers, of which a mecond crop is now out in abandence. I take it to have resulted from $H$. anguinea $\times \mathrm{H}_{\text {. }}$ cylindrica. I think I saw the same in flower last June at Kgw. C. Wolley Dod.
large peaches.-Some Sas Eagle Peaches, of unasual size and finish, have been lately gathered in the gardens at Ketton Hall, Stamford. Tae crop was a mediam one, and the fruits averaged about 1 lb . each. The largeat weighed 17,18 , and $19 \frac{1}{3} \mathrm{oz}$. respectively. The tree is planted in a cool-house in the natural oil. The crops of Peaches and Nectarines in the earlier houses were slso very good, being heary and well finished, and averaging from 14 to 16 oz . in weight. Owing to recent changer at Ketton, Mr. Drabble is debarred from bringing these eplendid frait to any exhibition. A Grower.
aLADIOLUS Bhahzada. - This is one of Mesars. Kelway \& Son's new introductions, and it is remarkable for ite deep dark crimson colour flashed with purple, and its rich parple markings in the throat, and for the stoutaes and fine form of the individual flowern. Two very fine apikes of it were exhibited at the recent flower show at Taunton, and its marked individuality of colour caused it to stand out from the reat of the flowers in the utand. Extreme cantion is now necensary in awarding

Certificates of Merit to new varieties of Gladioli, but of the excellence of this one there could be no doubt. $R$. $D$.

FOOD REQUIREMENTS OF THE CHRYSANTHE-MUM.-Referring to the article upon the above nubjuct of sour correspondent, M. P. Andersen, Which appeared in the issue of Aagast 17, p. 181, and the reply of W. Dykee in September 7, p. 272 , II beg to atate that I agree with Mr. Dgkes that the compost and manurial mixtare o! Mr. Andereen was decidedly deficient in nitrogen. The rate at which the mixtare was used is atated to be one part in 400 of oil, whereas the quantity recommended by me, and of a more concentrated manure, was one part to 250 parts of oil, whiln that eaggested by Mr. Dgkes was atill larger. Your correepondent will also find that I recommended after the potting that the Chrysathemum planta be watered every threa wetk up to the time of flowering with a of water. Mr. Anderaen made the mistake of mixing basic slag and sulphate of ammonis together; hence, not only was the nitrogen of the manure lost an a gas, but the evolation of free ammonia doubtless had a tendency to irjure the growing plante. Starvation and injary thas went hand in hand during the early part of the experiment. Again, the mixture used was lacking in soluble phosphate, owing to the fact that the phosphate in basic slag become available only very slowly, therefore, when this substacce take tbe place of saperphospate, twice as mach mat be employed. Mr. Andersen telle us that his compost appeared to ait the plants much better after so ne montha than at first, showing pretty clearly that the evolation of free ammonia from the soil was injarioas to the plante, and also that the phosphate only began to act afcer the main growth of the Carysanthemume had been made. Two very intereating facta have become clear in the experiment at Rothamated, which have an important bearing apon the relative value of solable and insoluble phosphate of lime; one is, that phosphate of lime, if not taken up at once by the growing plant, becomen fixtd in the soil, and is only recovered by growing plante over long
periode of time. The other in, tiat the capacity of caltivated plante to take ap phosphate of lime exist ing in the toil, diffors in a very remarkable degree. As one illustration, we may elect an experiment with $\mathrm{S}_{\text {wedish Turaips. There were two }}$ plote of land, one receiving 3 cwte. auperphosphate of lime per acre, and the other 6 cWts . per acre of basic alag (ground fine). The roots receiving the superphonphate grew much fater at the begioning than those which had the basic slag. Bat the root with the basic alag continued to grow later into the neason, and eventually gave about equal weight of crop with those receiving euperphophate. It is evident, therefore, that 1 part of phosphate of lime in the form of superphosphate is equal to 2 parts of the phosphate in the form of basic slag. Also that the Swedich Tarnips were not able to take up the phoaphoric acid of the bavic alag until towards the end of the season. It in quite clear that the absence of a soluble phompate of lime in the early tages of plant growth and inafficient nitrogen was the case of failure in Mr. Adersen's Chrysarthemam experiments. J. J. Willis, Harpenden.
apogamic ferns. - Mr. E J. Lowe, in his reference to my article on the above abject, assumes that apoganaic Ferna being destitute of archegonia, cannot yield varieties through their pores, a conclasion he deduce from my quatation from $\mathrm{D}_{3}$ Bary's papers on apogamy in the Botanische Zeitung, and my own remarks thereanent. Ds Bary, however, makes no auch assertion, and my remarks were directed solely to the imposibility of effecting crosves, and in that way combiniag variotal forms in the fashion for which Mr. E. J. Lown hel rendered himself famous among British Forn-cultivators. Within the lat few day he has sent we a number of frond of the created male Fern to demonatrate variation in its progeny, a fact to which I had already alluded in my paper a* indicating exception which Da Bary failed to find. I also said "we have no reanon to annume apogamy is a bar to variation any more than other bad-forming phenomena," which to my mind covers the whole ground of Mr . Lowe's contention. Ansuming, si we munt do, that the spore when shed containa the varietal potency which is eventaally seen in its own (i.e., not crossed) progeny, we are justified in expecting as much variation from apogamic bud an from normal sexual one fertilized by antheridia on same prothallus ; and to
what an extent this aelf-variation may be carried, I demonatrated nome years since at Chiswick by exhibiting a number of most diverse plamose Athyria, passing through all grades from plain to grandicep cristate forme and yet the reanlt of a nowing from one and the ame plant. These for reasons then given at length and generally accepted, certainly owed none of their diversity to crossing although it was little inferior in range to Mr. Lowe's exhibitm, hown to demonatrate the complex effects of multiple parentage. In my plants, however, the variety ran only in three directions, viz, delicacy of diasection, development of folionenens, and extent of terminal crissation, while his, as might be expected from their hybrid origin, showed diversity of all sorts. It is a very curiou biological fact, that the crested male Fern is exceptionally easy to raise from spores, and comes up a a atray in profusion among other nowings, demonatrating, in conjunction with its robut habit of growth, that it non-sexual mode of reproduction is in its favour, and seemingly might be a perpetual factor without any detriment to the continuance of that epecial branch of the species. Chas, T, Druery, FiL.S.

## New Inventions,

## A NEW BUDDING-KNIEE,

Thes new knife differs from all others in make. It is well known to all who practise badding that the hand of the workman han to execate variona mancuare before the bad can be interted in the T cat. The chief difficalty lies in raiving the bark. For this operation it was formerly necensary to turn the knife in the hand. The new badding-knife, invented by the head-gardener of one of the largest nurueries in Germany, Mr. Kaehler, and by Mr. Grunewald, of Tempelhof, near Berlin, enables all the operation to be made withont tarning the knife. The process now is an follows: the bud is cut by the long atraight part of the knife. By the wame part the obverse cut is made. Then the lower point of the triangular apex is laid against this obverse cut, and the lengthwire cut is made by a waving motion. By turning the knife to right and left the bark is separated. Care should be taken that during this action the apper point of the apex remains in the amo position. The bad may be inserted while the knife it raising the bark. By thiaknife (fig. 56) during ten minutes, eventy-five good bud of Acer, Syringa, Plams, Cherrien, Cydonia, \&c., were made before a committee of gardenern. U. D.

## Wrst's Improved Patent Orchid Basket

Is the new Orchid-bakket (see fig. 57), the inventor has made an effort to secure a more thorough watering of the contents than is possible by the wame means in the case of the ordinary basket made of aquare teak rods. The upper innide edges of the otherwise aquare rods are bevelled off with a view to throwing the water towarde the cantre of the bakket. There are alno two extra bevelled rode with flanges inserted between the two top bars, and these make the four sides comparatively level with each other, and therefore a better receptasle for water. It is claimed that following the adoption of this new buket, the rather tedious procesm of dipping bakketn containivg Orchide will be quite unnecemary, at each plant can be equally well satarated by means of a syringe or watering-can.

## Colonial Notes.

## HONG KONG.

Bamtrua chinensis is an erect-growing little Melaftomaceou whrab, attaininge height of about 3 ft , and the only representative of the genus. It makerit home on the north side of the inland at an elevation of about 1,400 feet, and in the immediate vicinity of Aristolochia longifolia, Gordonia anomala, Rhododendron qquamatam, Woodwardia Harlandi, and many other plante. It is an exceedingly pretty thing when in Alower, and on mccount of thiv, there in every
probability that it will be exterminated in Hong Kong in a very few year. Another thing which militates against its chance of existence, is that it grow just outaide a Earopean' private residence. The Chinese mervants are ment out to gather flowers, and, of courae, they cut the first they come acrons, which means Barthea chinensis, when in flower. If they were to cut flowers in a proper manner, there would be no harm done, but these pandala cut the whole ahrab down when they get the chance. The flowera are over 2 inches across, white suffased with pink in colour, and are borne on the ends of the branchen
long, and about $\frac{3}{4}$ inch broad, plicated, and wea. what grass-like in appearance. The rhizomet ner in size from that of a goose-quill to a man's lime finger. The plante which I found were growing a the south side of the island in a comparatively ity situation, not many feet above ea level, whild other collectors have found it in marahy apota the top of one of our high hill.

Aristolochia longifolia is a rare Hong Kong phat and is found growing in the cleftm of rock in nuthe shady situations. The leaves are 6 to 8 incter long, 1 to $1 \frac{1}{2}$ inchen wide, and lanceolate in hup
generally in threes. The leaver are lanceolate in ahape, $2 \frac{1}{2}$ to $3 \frac{1}{6}$ inches long, three-nerved, and on petiole $\frac{2}{2}$ inch in length. The calyx tube is sharply four-angled and $\frac{2}{2}$ inch long, baving subulate lobes 2 line long. The corolla consist of four petals nearly 1 inch in length, and over 를 inch in breadth. The plant flowers in March.

Lagerstroinia Fordii was first found by Mr. Ford a few years ago on Lantao Island. In Auguat last, I found it for the first time in Hong Kong, on the mouth side of the island, growing near the sea, There was only one plant of it, and this was about 10 feet higb, thriving in very little soil on the top of a rock. It is not nuch a showy species an some of the other Lageratrœmias, bat nevertheleme, is a plat well worth cultivating. The flowers are produced in paniclem 3 or 4 inches long, at the end of the branches. The calyx is about 3 lines long,

Fig. 57.-a new style orchid-basket.
downy white on the cutalde, and the tube furrowed, The petale are white, the limbs being about 2 lines across, orbicular in shape, and crimpled on long thin clawn. The leaves are lanceolate, 3 to 4 inches long, and 1 to $1 \frac{1}{2}$ inches wide, on petiolen of a quarter of an inch. When ripe, the capaule are dark brown in colour, owal in thape, and about寒 inch in length.

Pachystoma chinemse, when seen growing amonget long grase, is a pretty little Orchid when in flowfr although it is destitate of leaver at the time. It produces its scapes ranging from 9 inches to 2 feet high, and bearing from six to twelve flowers in April. Each flower is antended by a light brown lanceolate bract, $\frac{3}{4}$ inch long. The eepal are nearly 1 inch
 of a light lilac colour. The petals are the same length and colour an the exals, but only $\frac{1}{8}$ inch in width. The lip is three-Jobed, accate at the base, and crested in the centre. The middle lobe is either light green or yellow, the lateral loben being of the amme colour as the sepale and petals. The capes are theathed in light brown-coloured bract their whole length. After the flower have died away, the leaves appear. These are about 2 feet

The vein are very conspicuous on the under wuth bat less so on the apper. The atems and learem rusty tomentose when joang, but the upper ided the leaves becomen glabrous when old. The fown are produced in April on the old wood neur roots. The inner or upper aide of the periantiti dark parple, the throat being creamy-yellow with few parple pote on it. The month of the parime is fally 2 inches across, and the tube $3 \frac{3}{2}$ incherleen bent in the shape of a hook. The outside of the flower is marked with purple vein and articulation and densely covered with hairs, the general cole of the outside being greenith. When the flowi are fully developed, a very diragreeable odonr in emitted from them, similar to that of other apein of the genus. A plant which I found had upmri of a dozen flowers on it, and ite growthr ware mat 10 feet long. W. J. Tutcher.

Hong Kong Botanic Gardixs.
The annual report on the Botanical and Aforte tation Department of Hong Kong (by the Saptr intendent, Charle Ford, F.L.S.) for the year 18 O is now before an. The climatic and other dififedtion of the season under review, not merely proved escer sively difficalt to cope with, bat, in spite of all effort of the staff, caused serious and lasting iojum to the gardens. Immunity from storms for many yeris past had been evident in the beanty of the plath in 1894 a serie of typhoons, and a adden prolonged drought, did mischief, whick all pracautions taken were powerlens to complow counteract.

A atill more cerions evil was the plague of cter pillars which was prevalent during May and Juth The apecies (Eatricha panctata) multiplied numerounly, that an organised and very ex raid was made againat it, over a thourand $P$ being at one time employed in collecting the pillarn, and bringing them to certain polieen to the authorities at which were empowered ine if them by weight. Over 36 tons of caterpillar were collected, and the price pald for them 4,889,95 dole.

This expense was not the only loss affered, since in apite of all pain taken to collect and deatroy the peat, conaiderable damage was done before it was completely eradicated, since, while affecting nearly all the Pines in the colony, it was eapecially numeron in certain localitien, where many plant were made leafles, and (growing on poor noil) eventually died from it.

Although less atisfactory than those of former years, this report is oo far encouraging in that the difficulties mentioned in it are now marmounted, to that, granted a few favourable season, the gardens will, in condition and financial ponition, soon regain their former standpoint.

## SOCIETIES.

## ROYAL HORTICOLTURAL。

Srptember 5.-A meeting of the Fruit and Vegetable Committee was held et Chiswick on the above diste.
Present: Mr. J. Wright, in the chair; and Messre. G. Norman, J. A. Laing, G. Wythen, W. Farr, W Cammina, A. Dean, and A. F. Barron, Secretary.
The subjects to be examined wera a large collection of come 78 varieties of Pota'os, chiefly new, 76 diverse varieties of Brassica, and some American Tomatos. The Putatos were found to be of very diverse character-some early and ripe, others very late and robust. Disease was found rapidly decimating the leafage in all varieties, and in some othern, owing, no doubt, largely to the excessively prous nature of the soil, to be much affacted with disesse. Some, again, especially those of the Magnum Bonum type, of which there still seem to be so many seedlings raised, had become, through supertuberation, very ungainly, whilst some others were very large. It was noticeable that round-tubered varieties generally had grown out less than kidney forms. Ten sorts of great cropping capacity, and of excellent ap; earance, were selected for cooking, and later these, very admirably served in their coats, were tasted, and the following received three marks:Cockerelı's Seedling, pebble-shaped, white, medium grower, tubers having mealy Regent-like quality; Syon Hcuse Pro lific, late, sirong grower, oval, capital quality; Birmingbam, Triumph, now pretty well known, round, strong grower-very good; and Pride of Tonbridge (Webber), flattish round, rough good; and Pride of Ton
Cablapas, - The whole of the large trial of Brassica is from a sowing of seed made May 19. Two of the earlier varieties
were dealt with at a previous visit. On this ocrasion, after innpecting the entire group carefully, the committee resolved to select the best from typez, and the old Dwarf Early York, as a nummer Cabb ge? Sutton's Little Gem, a capital stock, greener and berter than Little Pixie; Leeds Market, the best of the larger section, s,ecially good for market field culture : Winnigatadt, a very green pointed-heart varioty, that always stands drought wouderfully well; and St. John's Day, the tenderest eating, for it eats like a Colewort, are the best. O all the dwarler forms of fiat or Drumbead Cabbages, each had three mark. This latter is a specially valuable Cabbage from summer-sowings to turn-in duriog antumn and winter. Of the two forms of Red Cabbage, the old large and the newer Dwari Early Biood-red, the committee regarded the latter as far the
best, and gave three marks to the Erfurt Blood-red (Benary) best, and gave three marks to the Erfurt Blood-red (Benary) and Sutton's Blood. red, as the best stock. A capital stock of The comparative absence of uniformity in many of the stock was noticed, showing that the greatest care is needed in seed growing to keep Cabbage stocks perfectly true.
The Tomato plants in pots, chiefly of American strains, did not exhibit any advance over varieties previously certificated, and well known in commerce. It is worthy of note, too, in relation to home-raised varieties, that many highly lauded elsewhere, when tried at Chiswick neem to be very much of a muchness indeed with other varieties.

September 10.-On Tueaday last a vegetable exbibition by the Royal Horticultural Society, which was arranged to take place at Chiswich, was held after effort to promote such an exhibition ander other auspicea had failed. The weather wa decidedly more pleasat than on other occasions at Chiswick and the show of vegetables from the point of view of quality was satisfactory, even if the namber of competitors was rather amaller than looked for. As the gardens themselves were looking well, and there were excellent collpctions of Dahlias, frait, and other thirgs, the viait to Chiswick wes an enjoyable one. For further remarks on this exhibition, see p. 300 .

## Floral Committee.

Preent: W. Marthall, Eqqu, in the chair; and Meorr, Chat. E. Pearroon, Chas. Jeffirier, J. H. Fitt, R. Dean, W. Bain, Geo. Stevens, George Gordon, Jno. Laing, Jas. Walker, Robto Owen, Harry Turner J. Jennings, Geo. Panl, Jno. Fraser, H. Herbat, J. T. Bennett Poë, Ed, Mawley, and J. D. Pawle.

Mesers. Barr \& Son, King Street, Covent Garden, exhibited a miscellaneous collection of hardy flowers, containing the very best of the species now in flower, pereunial and annual Asters, Violas, Tiaridias, Liliums in variety, perennal Sumflowera, Pysethrums, and a colloction of rarieties of Phioxes
were conspicuous. Amongat the variet ies of phlozes, an were consplcuous. Amongat the varieties of Phlores, and
Award of Merit was recommended to Leonardo da Vinci, a capital variety, with large white flowers, having rose centre,
bright-looking and very pretty. Messrs. MAkr \& So: had bright-looking and very pretty. Messrs. HAhr \& SoN had
also a collection of plants of bedding Antirrhinums in many colours, and plants of a dwarf strain, growng about 10 inches higb, very compact and free-flowering. A pretty white variety, about 15 inches high, extremely floriferous, should also be mentioned, it is called Queen of the North (Silver Flora Medal).
Some carden Roses in miscellaneous varisty were from Messrs. WM. Paul \& Sons, Waltham Croes Nurseries, Herts. The blooms, cut with long atems and foliage, and tied in bunches, were exhibited in an altractive manner. The Duke of York, winter-floworing China Rose, was well exhibited, and with W. A. Richardoon and Marie Van Houlte, form a vepy excellent trio in this nection of 10 saed dinean Mab in anow differentshades of Apricot, vary pretty
to become popular (Silver Flora Medsi).
A new perennial Sunflower called Stole Park Favourite, was exhibited by Mr. J. HUGHEs, Stoke Park Gardens, Guildford. The plants are said to grow 5 to 6 feet high, of good branching habit. The blooms are produced on long atem, and are suitable for furvishing vases, \&cc. The flower is an extra bright one, of medium size (Award of Merit).
Mesors. Bobt. Veitch \& Son, Exeter, had a few bunches of Nemesia strumosa. Mr. Walter Salmon, Ivy Cottages, Elder Road, West Norwood, ezhibited a collection of tall French Marigolds and Eome double flowers of Zinnia elegans, beside a general collection of hardy flowers, including Asters in variety. Violas. Salpiglcssis, Dianthus, Dahlias Asters in varity, Violas, Salpiglcssis, Dianthus,
Miss Hudson, Gunnersbury Eouse Gardens, was awarded a Silver Banksian Medal for a decorative exhibit of Dahlias, and Silver Banhsian Medal for a decorative exhibit of Dahlias, and
a similar medal was obtained by Mr. A. W $\boldsymbol{T}$ Terer, Knap Hill a similar medal was obtained by Mr, A. W』terer, Knap Hill Nursery, near Woling, who exbibited scme
effective blue Spruce, Picea pangens argentel.

## Dainlias.

The collections of Dahlias flled a considerable portion oi one of the tents with their brilliance. Mr. T. S. WARE, raised backgrcund of panels of Cactusard decorative varietics ronted ifh bunches of bright Pompons. Of true Cactils arieties, there were excellent examples of
Gem, Mra. A. Beck, new, pule orange-scarlet, fine Cactus shape; Gloriosa, Miss V. Morgan, Bertha Mawley, Matchlers, Mrs. Francis Fell, white, with slight pale yollowish-green centre-a decided acquigition to the wite forms if it will maintain this character; Ledy Penzance, Robt Cannell, Countess best were Harry Freeman, Jonn Hi Roach Fmpresetier, the best were Harry Freeman, John H. Roach. Empress of India, Vifcountess Folkestone, Lady Montague, Oban, Maid of Kent very pretty fancy variety; Kynerith, R. Maher, and Countess of Pembrole. Of Pompon varieties: there were charming bunches of Emily Hopper, yellow; Arthur West. Tommy Keith, Virginale, Stanley Ford, Sunshine, Mary Kirk, Hector, Winifred, and Florence Woodland, \&c. (Silver-gilt Banksian Medal).
A very excellent collection of 144 blooms of show and fancy Dahlias came from Mr. S. Mortimer, Swiss, Nursery, Farnham. Some leading flowers, characterieed by high quality. were aeen in Mr. Gladstone, Mrs. Morgan, Buttercup. Colo-mist-one of the most distinct and constant. Duchess of Albany, Sunset (fancy), George Barnes (fancy), Jno. Walker, Novelty, Mrs. J. Downie (self, very fine), and Henry Eckford, as a fine Mrs. J. Downie (self, very fine), and Henry Eickord, as a fine
crimson self. Mr. Mortimer aloo had a dozen bunches of Cactus and decorative varietiea, chief among them being Delicata, Lady Penzance, Bertha, Mawley, Mayor Hasking, \&c. Delicata, Lady Penzance, Bertha Mawley, Mayor Hasking, \&c.
(Silver Flora Medal). Then there was a good collection of show Cactus, Pompon, and single Dahlias, from Measrs. J. Cencal \& Sons, Crawley, about four dozen blooms of the show types, and charming bunches of the following singles, Victoria, Phyllis, May Sharpe, Miss C. Morland, small, bright orange ecarlet, very good; Evelyn, Dearest, very chaste; Lowfeld Beauty, Miss Roberts, a charming soft yellow; Miss Ashley, amber shaded with delicate rose, and having a crimson ring round the eye; and Miss Glasscock, a very good selection of single varieties for exhibition purposes. There were twenty
four bunches of Pompons also, the choicest were Rosebud four bunches of Pompons also, the choicest were Rosebud,
pale ground, broadly tipped with rosy-nurple (Award of pale ground, broadly tipped with rosy-nurple (Award of Sunshine, Lilian, Lorna Doone, Emily Hopper, Martial Mabel, Sunshine, Lilian, Lorna Doone, Emily Hopper, Martial Mabel,
Grace, Bevenge, Tommy Keith, and Darknesa. Of Cactus varieties, Mrs. Wilson Noble, salmon red, an excellent Cactus type, very bright and fine (Award of Merit); Mrs. Gordon Sloane, dark salmon-red, good Cactus; Earl of Pembrche, Lady Perzance, Mayor Haskins, Harmony, Delicata, Ernest Glass, and Gloriosa (Silver Flors Medal).
Mr. C. TURNER, Royal Nursery, Slough, had a handeome bunch of his large, bright, paleyellow decorative Mrs. Turner Endymion, bright bcarlet, a good Cactus; and firteen blooms of Beatrice, bright rosy-pink with s slight flushing of mave, very diatinot, constant and attractive; and some bunchel of charming fompona, mainly now, viz, Ganymede, already with purple and tipped with white, very distiact (Award of Merit): Madeline, yellow ground, tipped with dark cerise (ATrard of Merit); Zoe ground, tipped with dark cerise pretty (Award of Morti); Peari, white; Ruy Blaw Jason, marool ; and Veitchii, crimoon, very bright and finely formed.

Mr. J. T. WTET, Cornwalle, Brentwood, had some fine new Cactus varieties, such as Mis Annie Jonen, brilliant scarlet, one of the brightest of the true Cactue type (Award of Merit) ; Miss Nightingale, bright deep orange-marlet, very effecture, true Cactus (Award of Merit); Misnie, dehente jinit lower petals, the centre white, a decorative varnety; Bamett Tabrum, bright red with slight dark shading, fino Cacius thaye: Emily French, pale salmon-red, a very good type Shape: Emily French, pale salmon-red, a very good type
Mabel, delicate malmon basal petals, fushed with rowe, yellow centre, true Cactus, a model in point of shape; and Miss Ethel, bright reddish-cerise, very attractive, but not a gool Ethel, bright reddich-cerise, very attractive, but not a good
Cactus type.
Mr. W. Batomblor. Hevefield Park, Uxbridge, had decoMr. W. Batorfilor, Berefield Pary, Uxbridge, had deco-
mative Willie Batchelor, bright pale ecarlet, with white flame and tip, small and very pretty (Award of Merit); and single, Mris. Core Langton. rather Lapge, but very dietinet, corleeurimson, with a marcon ring round the efe (A ward of Merti). Mr. C. Turwik also had new show Dahlia Marjoris, amber ground, suffued with salmon, the reverse of the petale alighty purple, very primining; Barbara, deep crimson eelf; shotev ham Hero, tipped with bright purple; Rowamond, pale eround wath bright rony-purplo tip; and Dante, a umall marooncrimion elf, good chape.
Mr. Q. St. Piprre H\&Rris, Orpingtod, had Yellow Qlobe. a very promising yellow eell, of fine petal and great depth; flaked, aplashed and striped with crimson fancy, palo ground

## Orchid Oommittee.

Present: Harry J. Veitch, Eeq., in the Chair; and Meara. Jas. O'Brien (Secretary), Jan. Douglat, H. J. Chapman, and H. M. Pollett.

Chiswick seems to have but little attraction for Orchid growers. On the present occasion there were but fow entriea. The small group of hybrid Orchid ataged by Mesers. Jus. Vercer \& Sons, Royal Exotic Nurnery, Chelrea, wan the oaly important exhibit, but it contained some remarkably fine thinge. Of these, the magnificent Leelio-Cattleya $\times$ Clonia बuperba (L.-O. $\times$ elegans Turneri $\delta, C$. Warscewiczii $q$ ), may be ranked among the best results of the hybridist's and glowing but the lip was more openly displayed at the bise. The petals were very broad, and, lize the whole flower, of good firm substance; the sepals and petals zoft rosy-lilac, with an indescribably heautuful closels-ket veming of crimson-purple; the liroad labellum is of a glowing mapenta-purple bue, the utside of the side-kes lilac, with purple reining-a most beautiful llower, viewed from any asject, and well worthy of the Firnt-class Certificate awarded. Ancther fine norelty was
Lrelio-Cattleya $\times$ Eunomia (C. Gasselliana ó, L. pumila Dajana \&), a plant of neat dwarf habit and large flowers o the C. Labiata type; sepals and petals of a delicate light rose colonr; the base of the Hp orange, the front iche Hight velvety purple with elight lilac margin (Award of Merit). In the samo group wereleelio-Cattleya $\times$ Paryeatia (L. pumila ${ }^{\circ}$, C. Bowring fana $\%$ ), a pretty plant, with the habit of Lo pumila, but much stouter, and flowers equal in size, and resembling in form thote of L. pumila prostans, flowers rosy-lilac, with light purp'e front to the lip (Award of Merit); Cypripedium $\times$ Carnusianum, Veitch s variety (Haynaldianum os Spicer adum \&), a very singular and beautiful variety, with as distinguishing features, so far as they bave been tested, a much dwarter inflorescence, and darker and more richly-coloured flowers than the type, and having the lower sepals dipjoined and divergent right and left, a feature which has so far proved conatant, and which gives the flower a very striling appearauce. The upper apal is white, suffured with purple with emerald-gre en lines; the reots; lower sepals yellowish, with emerald-gre on lines; the reat of the flower greenioh jellow, with purple-brown tinge(A wird of Merit). Oypripedium $\times$ Metis (philippinease fo, villoam Boxalli i). Ewith ohining yellow flowers fluahed with chocolate, the large yellow hairy staminode being very singular; and Lelio-Cattleya $\times$ Nysa purpurea, a worthy hybrid of the L.-C. $x$ exoniensis class, and which was so finely shown in several varieties by Messrs. Veitch at the corresponding show at Chiswick lat year. Cypripedium Charlesworthii, with double labellum, wear. hown. Messrg. Jas. Veitch \& Son were the first futroducers of C. Charlesworthii, but their plants being small, they were not the first to flower it.
F. W. Moore, E\&q., Rosal Botanic Gardens, Glasnevin, Dublin, sent the pretty Maxillaria striata, with flowers of good Eize. The sepals yellow, striped with purple, the lower ones reflezed; petals similarly colcured, but narrower and curved back at the tips; lip cream-white with parple veining. and white apex (Botanical Certificate).
Hx. Sraw. Exq., 8 tamford House, Ashton-under Lyne (ero. Mr. J. Oliffe), sent Oypripedium $\times$ Whitalyavem (Boainill dark form of O. Boralli, but the leave am tomelated, sind nadicate tbet a oros has been eftected.
A. H. SMEE Req. The Grarge, Walliggton (gros Mr. Cummina), showed a three-flowered inforenconce of a pretty ight form of Cattley $\times$ Hariyane; and A. H. Mictor, Feq, Castleton House, White Lediea Road, Olifton (grv, Mr. 4 . Marrell), showed Odontoglosoupa Insleayii splendens and Oncidium Jontaianum.

## Fruit Committee.

Present : Philip Crowley, Enq, in the chair; and Mespre. W. Wilks, Geo. Banyard, G. W. Cammina H. Baldernon, J. Wright, J. W. Bate:, P. C. M Veitch, W. Farr, G. H. Sage, Robt. Fife, Jar. H. Veitch, Wm. Pope, Jas. Caeal, T. Francis Riveri, Geo. Wythes, Geo, Reynolde, and Alex. Dean.
the Competitive Vegetables.
These were all found in a large tent, ample room being thas provided. Generally, the quality was excellent, that of the best collections first-rate. More competition might have been looked for, but the prizes were perhaps none too attractive. Still, with the present year's experience, if the show be fol lowed up yearly, there can be no doubt, with a revised schedule, it will grow into ercoeding popularity, and become the great vegetable exhibition of the kingdom.
Collections. - Those in the class for twelve hinds naturally included the best samples, and brought the leading exhibitors. The lst prize was talken by Mr. T. Wilkins, gr. to Lady Theodora Guest, Inwood Gardens, Henstridge, with goner illy very fine samples. They comprised Autumn Giant Cauliflower, superb Leeks, gigantic white Celery, rather large Intermediate Carrots, good Perfection Tomatos, Autocrat Peas,
Ne Plus Ultra Ruaner Beans, fiae Coldfinder Potatos, large Ne Plus Ultra Ruaner Beans, fine Goldfinder Potatos, large
but rather spotted Ailsa Craig Onions, beautiful Snowall but rather spotted Ailsa Craig Onions, beautiful Snowball
Turnips, and Globe Artichokes. Mr. Bowerman, gr. to C. Hoare, Esq., Hackwood Park, Basingstoke, was a very close 2nd, having aleo good. Cauliflowers, grand Ailsa, Craig Onions, eplendid Perfection Tomatos, nood Celery, Satisfaction Potatos, rather too large; good Beet, Prizewinner Runner Beans, good Carrote, Peas, ato. Mr. Mairs.igr. to Mr. J. Sheller, Crediton, was 3 rd . The whole of the prizes in this class were given by Mesars. Sutror \& Sorss, Reading, and were the only epecial ones offered.
ones offered. the larger one. Here Mr. C. J. Waite, gr. to the Hon. Col. Talbot, Glenhurst, Esher, |was a good 1st, having excellent Cauliflowers, good Carrota, Perfection Tomatos, Prize-winner Ranner Beans, Snowball Turnips, Exhibition Onions, Satisfaction Potatos, \&c.; Mr. Empson, gr. to Mrs. Wivgrield, Ampthill, Beds, was 2nd ; an
L. Powelc, Weybridge, 3rd.

In the class for six kinds, a fresh lot of exhibitors competed, the best bsing Mr. Kneller, gr. to G. Portal, Esq.,
Malshanger, Basingztuke; Mr. Lioyd, Merton Lodge, Chis Malshanger, Basingstwke ; Mr. LLord, Mu kining 2nd and Mr. G. Nortr, Bu ,king ham, was 3rd. Taling the clases now in schedule order, there were eight lots of three Canliflowers, Mr. Empson coming 1st with perfect heads; Mr. W. Pope, gr. to the Earl of Carrarvon,
Highelere Castle, Newbury, 2nd. with very solid ones ; and Highclere Castle, Ne
Mr. Mairs was 3rd.
Only two competed for Kale herds, Mr. Wythes, gr. to Earl Percy, Syon House, Brentiond ; and Mr. Peatery, Isleworth, taking the prizes.
There was good competition with dishes of Brussels Sprouts, YOPE 2nd with Ezhibition, larger.
Mopz 2nd with Ezhibition, larger. Ylanders. There were thirteen pairs of Marrows; with one exception all good. Mr. Marrs was 1st, with very pretty smallish long white ; Mr. R. Lye, gro to M•s. KiNgsmill, Sydmonton Court, Newbury, being 2nd, with others,
very handsome, and a trifle larger. Cucumbers were fairly vory handsome, and a trifle larger. Cucumbers were fairly
good. Mr. Lre having the best pair with Matchles3; Mr. good. Mr. Lre having the best pair with Matchless; Mr.
WArte coming 2nd with Progress, and Mr. Empson 3rd with Model. Scorzonera in bundles was not an attractive class. Mr. Pentwey had the best roots, and Mr. Waite had the beet sorts of Salsafy.
of Runner Beans nearly all were of the scarlet type, Mr. Lye being 1st with beautiful Prizewinner: Mr. Bowerman coming 2nd with the same variety. With dwarf French Beans Mr. Bowervar was 1st, having handsome Canadian Wonder Mr. H. W. Ward, gr. to the Earl of Radnor, Longtord Castle, Salisbury, being 2nd with the same. Broad Beans were too much out of season, but there was a capital dish of Mammoth Long Pod from Mr. Lye; and Mr. Bowerman was 2nd with the same ; Mr. WAITE coming 3rd.
Peas were fairly good for the time of year. Mr. W. Palmer, Andover, being list with Duke of Albany; Mr. Ward coming next with good Anticipation ; and Mr. Wythes was 3rd with Autocrat. Meesrs. Wilxins and Cooksor had the best of the Artichokee in thatorder. Mr. Wyteres was the only exhibitor of Cardoons. Something like the old show form was seen in the superb samples of Potatos shown by Mr. Pope, who had three beautiful dishes of Kidneys in Magnet, Matchless, and White Kidnoy; Mr. Bowerman was 3nd with Snowdrop,
Cole's Yavourita, and Prizataker; Mr. Wurte coming 3rd. Cole's Yavourite, and Prizetaker; Mr. White coming 3rd,
The beat wingle dish of Kidneys came from Mr. LYE, who The best mingle dish of Kidneys came from Mr. LYE, who
had fine Chancellor; Mr. Normi coming 2nd with Breese.
The beot three dishes of Rounds were from Mr. Pope, also beautiful samples of Satisfaction, Perfection. and Nomsuch, medium and perfect; Mr. Marrs came next with The Dean,
Pink's Perfection, and Windsor Castle; Mr. Norti was 3rd Pink's Perfection, and Windsor Castle ; Mr. Norter was 3rd.
With one digh of Rounds Mr. Nortr was a good lat with handsome Windsor Castle; Mr. Lye coming 2ad with Satio faction. This latter exhbibitor had the beat sir Leeks clear white and good; Mr. Marrs coming 2nd; and Mr. Pope 3rd.
Mr. WAITE was well lat with three dishes of Onions, having fine Ailm Craig, Kahibition, and Cocoa Nut; Mr, Matrs coming 2nd, and Mr. WARD 3rd. The best taree buaches of Tumipa were from Mr. Nortie, Mr. Osman Sutron coming 2nd; Whilat with a aingle bunch Mr. WAFTE was lat, and Mr. LTE and, both with very handrome Snowbull. Mr. W YTHES was the ouly exhibitor of Celeriac, but the sample was excellent. With three varieties of Carrots, Mr. NORTH was 1st, having Very long.fhin, taporing long Surrey, good Intarmediate, and
 in 2ad, and Mand Bowernman 3rd, with. Wrugins coming Mr. LIE had the beat bix Parmips, Mr. Wa ame coming 2nd, Mr. WYTETs cosming 2nd. Mr. Webeter, Hore to E. J.

Prestor, Ksq., Beckenham, had the beat and very handsome Beet in Veitch's Blood Red, a perfect stock; Mr. Warte coming 2nd. This exhibitor was lit with two varieties of Endive, and Mr. Pentwey was and, both having Batavian and Green Curled. Mr. Lye camo 1st with two varieties of Lettuces, both Cos; Mr. Waite coming 2nd. Celery was good, Mr. Wilkins having the best with Solid White and Sulham Prize, Mr. White being 2nd.
A collection of salads enabled Mr. WyTHes to win 1at place easily, as his capital collection was set up artistically in a large plot, having plants of ripe fruit of Tomatos bent over the top. Lettuces, Endives, Oucumbers, Celery, Beet, \&c., made up the collection. Mr. Waite was 2nd, and Mr. Sallition West Norwood, 3rd. Mr. Salmon was
of eighteen bunches of Herbs in variety; Mr. Watre being of eighteen bunches of Herbs in variety; Mr. The consolation class for any other vegetable, still brought Mr. WATTE to the front with a superb dish of Perfec tion Tomaton; Mr. Basile came 2nd with huge firm Red Cabbages; and Mr. Albert, of Chiswick, was 3rd with
Tomatos, Corncobs, Kohl Rabi, huge Pumpkins, \&ce, made up other variety hers.

## Miscellaneous.

There were numerous honorary exhibits. Foremost was a very large, varied, and interesting collection of vegetables, sent by Mr. O. THoMas, from the Queen's Gardens, Frogmore. It would be idle to say that these samples compared favourably with what were in the competitions; but the collection was a remarkably varied one, and comprised every description of vegetables in season, as also Salads. The whole was artistically grouped and represented in the collecting and arranging a great amount of labjur. A Silver-gilt Knightian Medal was a warded.
A not less meritorious collection came from Burford Lodge, Dorking, set up by Mr. Bain, gr. to Sír Trevor Lawrence, president of the society. This comprised Herbs and Salads Gourds and Tomatos, Beans and Capsicums. Potatos and Carrots, huge Aubergines, tiny Kohl Rabi, growing Mustard and Cress, \&c. A Silver-gilt Knightian Medal was awarded.
This exhibit, to which we mugt refer again, was the most original and instructive in the whole show.
Mr. Empsow had a large and excellent collection of Carrots (Vote of Thanks). Mr. WoodHead, Isleworth, lhad nice red and white Cabbages, Turnips, and Brussels Sprouts. Mr. W. Palmer showed Tomato Palmer's Triumph, like Conference Mr. H. W. Ward had Carter'd Heartwell Cabbage, Model Curled Lettace, and Giant Cos do. Messrs. Fkilows a BYDER, Orpington, showed twenty-one dishes of their handsome Tomato Duke of York, the fraits of medium size and perfect form (Silver Banksian Medal); and from the Soc'ety's gardens came examples of the varieties of Cabbages and Potatos, mentioned in our report of the meeting of the Frait Committee at Chiswick on Tharsday last, and all of which received three marks for general excellence.

## Merit were recommended to these.

4 collection of seren varieties of Peas in so many dishes was shown by Mesgrs. DE: Rotischild, Gunnersbury House, Acton (gr., Mr. Jas. Hułson), Sutton's Prolific, Sutton's A1,
William I., Veitch's Chel onian, Sutton's Reading Giant, William I., Veitch's Chel onian, Sutton's Reading Giant,
Sutton's Exonian, and Veitch's Autocrat. The last-named Was sown on May 13, Reading Giant and Chelsonian on June 5, and the others on July 11. All the latter were ready to pick, but not very full.
Two Cucumbers, called Frogmora Prolific, were shown by Her Majesty the Quren (gro, Mr. O. Thomas). These are medium-sized, darla green fruits, obtained from Lockie's Per fection $\times$ Rochford.
Mr. T. Wilkins, gro to Lady Teeodora Guest, Inwood House, Henstridge, sent a fow fruits of Mango for exhibition.
A dish of Swedish Apples [Akera] was shown by Messra. Geo BUTrard \& Co., Maidstone. The fruits are very solid, the colour similar to a Peach, but faintly streaked. Meerrs. Bunyard \& Co. also had a dish of fing fruits of Lady Sudeley A soedling Plum, named Gordon Castle, was exh
Mr. CHAS. Webster, Gordon Castle Gardens, Banff.
Fruits of the Alpine Strawbarry Quatre-saisons, Rouge Ameliorée that obtained an Award of Merit on August 13 last, were exhibited by Mr. Hudson, Guanerabury House Gardens, Acton, W.
A capital Melon was exhibited by Mr. H. W. Ward, gro to the Rarl of Radnor, Longford Castle, Salisbury. The variety is known as the Earl's Favourite, is a good size, straw-coloured, prominently netted, green-fleeh of very good flavour (First class Cortificate). Two Melons were also good havour (First Miller, gr. to Lord Hocer, Rualey Ladeg by Mr. J. W. these was named Archie Henderen Lodge. Ksher. One of coarsely netted, and green-fleshed. The other was La Favourite, also green-flesh.
From the Royal Gardens, Windsor, Mr. O. Trowas ex hibited stem of Tomat), Frogmore Golden, with fruits, a large good-looking variety; and Mr. A.J. WARD, Richmond, showed a lot of first-class Tomatos, Chemin Rouge, which had been grown upon a Richmond allotment (Bronze Banksian Medal).
A pleasant-looking Apple namsed Marshall's Seedling, was exhibited by Mesers. Tros. RIV ers of Son, \&a wbridgeworth; and A. H. SMEE, Esq., The Grange, Wallingford, showed two fruits of an exceptionally solid culinary Apple named Remborough, large size, green, but alightly coloured with deep - yo (AWard of Merit).

Cord, Whibited ganim of Earl Percex, Byou House, Brontford, whibited havim of a dwart vory prolific Irench bean, named Northumberland Prolific (A ward of Merit). Two nicelooking red-fleshed Melons were shown by Mr. J. Cortest gandener to the Marquis of Noemambr. \& dozen plantel of the Cabbage Lettuce, named Intton': Favourito, exhibited by Mr. HuDsom from Gunnersbuzy House Garden, were culturally

Commended by the committee. Some fruits of a Tom named Burt's Surprise, from Mr. F. M. Burp, Red How Worthing, were rather smaillong fruits of hithe solidity. dish of very well-grown fruite of Pear souvenir du Conget,
exhibited from the Royal Horticultural Gardens culturally Commended.
Messra. S. Spooner \& Sons, Hounslow, Middlesax, conthbuted a very commendable oollection of fruit, none of which was other than good in quality. We noticed a aice bo of Duchess Favourite, a good, well-known September Apple something like Quarrenden in appearance, but highercoloumed even, and rather larger; Lord Suffield, Stone's Apple, Won cester Pearmain, Yellow Ingestre, Councillor, and an others; also a dish of Hessle Pears, and a few sorts of Fial (Silver Knightian Medal).
Mesers. J. Cheal \& Sons, Lowfield Nurvery, Cravien showed excellent specimens of a very ornamental scarlet Cond as well as fruits of Transcendent, Golden Siberian, and Darts mouth Crabs. A rare lot of Tomato stems in many varittly laden with heavy crops from the open air were the meame obtaining for the Earl of Carvarvon the committee's thatid As is usual on such occasions as this, Messrs. Surtorit Sons, Reading, staged a representative collection of vegetable illustrative of high culture and careful selection, and a Silve gilt Knightian Medal was awarded the erhibit. Ailsa Caig
Onions, 70 of which were said to weigh 2 cwt., and seemen rarieties of Carrots also were very fine ; but why it is necomin to show that the Carrots have penetrated to a depth of 3 fom 10 inches is not evident. However, that is the length of mm of the roots shown, though of course for practical purposes only about 12 inches was of any use. The Exhibition varietry which is a cross between Long Surrey and Iatermedith Carrots, was very noteworthy. Windsor Cistle Potato mil Little Gem Cabbage ware also deserving all prai e. Tomatm and other vegetables ware woll representef.
A collection of vegatables renirkable for high culluml merit was the exhibit from Messes. R. Verrci \& Sor, Kxetm Their Monarch Leeks, Model Carrots, Flyiog Dutchmin Tomato, and the different varieties of Onions, Carrots, Culliflowers, Radishes, and other things, reflected very great ceredit on the Exeter firm, and a Silver Kaightian Medal mu awarded.
Messrs. H. Cannell \& Sons, Swanley, Kent, were mot behind, but exhibited a large collection of vegetables five their farm near Swanley. A Silver Knightian Meda mw awarded this collection, in which thare were excollent samples of Onions, Leeks, Beet, Carrots, Brussels Sprouts, Artichoien Marrows, \&c.
Mesers. JAS. Veitci \& Sons, Royal Exotic Nursery, Cheleen in their remarkable collection, had splendid specimens of thir Green Curled Endive, Broad-leaved Batavian Endire, mid White Curled Endive. Their Savoys, Cabbage, Seallh, Beet and Carrots, too, were of capital quality; Kohr Roin both green and purple kinds; Salsafy, Turnips, Redidhem, Runner Beans, and Tomatos, were all of good character and choice selection. Messrs. Veitch were decorvelly awarted Silver-kilt Knightian Medal.
Mr. Geo. Wythes, gr. to Earl Percr. Syon Honse, receind a similar Medal for a very large collection of vegetabes to 0 shown from a private garden, and representative of almom all kinds now in season.
Messrs. Dobbie \& Co., Rothesay, Scotland, had a commenth abe collection of vegetables, and their Paraley, Du boird Selectod, deserves meation; it is one of the very fiaent carial selections we have seen. Parsnips, Celery, and other
were included in this exhibit (Bronze Bankeian Meda).
were included in this exhibit (Bronze Banksian Modaly
Mesers. BARR \& Sow, King Street, Covent Garden, exhititad number of varieties of Tomatoo cultivated in the open most of them of the Perfection type; also a nice iot 4. Kale, both green and purple (Silver Bankgian Medal).
Messrs. Sutton te Sons, Reading, exhibitod a sanith unner Bean called A1, apparently a wonderful bert).

## Lecture on Garden Manureß.

There was considerable interest manifested in the lecture given by Mr. W. G. Wation, the aubject of which was "Garden Manures." Ia the abuans the author, the paper was read by the Ansirme Secretary (Mr. J. Weathers), and We ship wae undertaken by A. W. Satton, Eiq. In commencing the subject, Mr. Watsoa vory propmily dealt first with the most common formo of manure sid or fark most easily procurable, viz., that furnished by :tabied manurt yards, It was remarked that stable or farm-ys recedingly variable in its quality. It would rary particular, according to the age and condition of the upon what kind of straw whes used, and, further, quantity of atraw that was mired with the real mas thil Manure from young growing animales was lesy older ones, and animals that were work oaly.
also give manure of medium strength oum there would be more nutrition abstracted from the the animals than in the case of fully-grown animsile be tislly worked. Medicine given to animalio would
affeot the quality of the manure. All the stra above the quantity requisite to absorb the uriae woma tained almost all the elements required by crops, org inorganic. As a general manure, it was a most pan thit however, nothing be supplied to the land ing lime and sith two elemente which in large degree become aboorbod h tood by the which in large degree bof bone sad ficth

Valuable hints were given as to the treatment of this kind of manure, and the heap-method explained. It was insisted that in order to keep off the rain, manare should be stacked in covered places. Urine being the very best part of the manure should not be allowed to trickle away, but should run into an underground tank, from which occasionally it could be pumped and thrown over the maes of decaying manure, which would prevent excessive fermentation, and the consequent lose of ammonia. The temperature and the centre of the heap should never rise beyond $150^{\circ}$, nor be allowed at any time to steam In eilher cases there will be a loss of ammonia. A strong odou would likewiee indicate loes from this cause. The degree of usefulness possessed by the excrement from different animals was explained thus: the manure from cows contained a small amount of nitrogen, and large percentage of water. Horsee' excrement was richer in nitrogen, and contained less water: it had also the advantage of being easily dietributed, and was toon available as plant food. Sheep-dung had a still higher percentage of Ditrogeo, and a less degree of water, being also essily moluble. Pig-manure varied considerably, according to the food they consumed. \&c. The reasons for applying freeh dung to stiff soils, and thoroughly decomposed manure to light and dry soils, was next explained, and the necessity of giving soil of the latter nature manure which was at once soluble and available to the plants was eraphasised. Unless this was done, the manure was wested through the soil, before the crope had benefited from its application.
Bcnes were now employed in very much finer condition than
formerly. It had been found that the finer the bones were ground, the sooner were they available to plant-life and the more valuable were they as manure. Bone-meal is now rery much ased.

Superphosphate of Lime.-Mr. Watson then explained the character of this valuable manure, by saying that were bones treated with sulphuric acid, certain gases would become volatile, and the remaining compound would be that known as superphosphate of lime. This euperphosphate was now manufactured by other means, and a considerable amount is nced. Bone-meal was better for dry and hot zoils than the superphosphat-.
Nitrate of Soda: Phosphatic Slog. -The phosphatic slag. a mineral masure, was good for pesty soils, and considerable benefit might be expected to follow its application on land in the Fen district. Nitrate of coda was obtained in large quantities from South America. Its action was quicker than that of any other nitrogenous mapure. The quality of thi manure is very variable. It is more easily washed from the soil than any other, and it is therefore not a complete manure, but should be used only as an immediate stimulant.
It used -This was dercribed as the dried excrement of birds. It uied to contain about 16 to 18 per cent. of ammonia, but through the excasive adulteration now practised, it falls froquently to 11 por cont., and sometimes 0 to 10 per cant. Tue Trens Guavo in the excrament of the native bate, and realises hiph prices. Guano is adaltorated with mand, eley, powdered bicl, gypewn, te,
Lime was next alluded to, and its well-hnown action upon soils explained. The application of lime hastens nitrification, and is very useful in old gardens where a quantity of vegetable humus is present.
Potash is absolutely indispensable to plants, and. without it no chlorophyll can be formed. It is applied frequently as parasitic fungi wheo used in large quantities. teodency to parasitic fungi when used in large quantities.
it, the weed was frequently mired whore, and in prepariog gas lime, About 10 to 15 tons per acre was the quantity recommended
agricultural and wanares under cortain circnmed as garden and agricultural manure under cortain circumstances. The fish posed, it is used at about covered with earth. When decom. posed, it is used at about the rate of $1+$ tons to the acre. Salt acts organically upon the soil, in addition to being a manure Ite application is useful in ridding the soil of cartain insect pests. Woollen rags are much used in Kent as manure for Hops.
Biood and Soot were also alluded to, and their uses explained. If economy be practised in regard to manures, it was necessary to first find by analysis what was deficient in the
soil, and then supply that only. Some soils were defirient only in one element, and did not require a general or perfect manure. The storsge of manure is an important item economi cally. The gardener who allows the urine to eacape from his stabo manure, and afterwards bura chemical preparations, may be said to buy what he throws away.
of maling experiments in regard to land manore and cropsect

NATIONAL CHRYSANTHEMIM
Shptember 3, 4, AND 5.-On Tuenday lant was opened, under the anupices of the National Society, an early exbibition of Chryaanthemams in the Royal Aquarium. Fortunately, perhsps, from the visitorn' point of view, the early shows are held in conjonction with exhibitions of Dahlias and Gladioli under the ame management. At the September ahow there is uaslly but a small collection of Caryanthemoma to be aeen, and the occasion ander notice was certainly noexception to the rule. Bat little succes appeare to reward the attempt to prolong the season of the large-flowering Chryasnthemum,
by obtaining varietie that will bloom well before by obtaining varietien that will bloom well before
not see sny canse for regret in this circamatance, being of opinion that the Chrysanthemum is eseentially an sutumn Gower, that it ia beat appreciated at that period, and that if it be desirable that the flowering period be prolonged, it ahould be by the mean of Jate varieties rather than early ones.

## Chrysanthemums

The class for twenty-four bunches of Chrysanthemume, in not fewer than eighteen varieties, was won by Mr. Eric H Such, The Nurseries, Maidenhead. The "bunches" consisted of a number of sprays in each variety, dibbled into pots fillen with cocoa-nut fibre, in a similar manner to that in which cuttings are put in-an arrangement not quite as pleasing as the ordinary tied bunches.
The twelve blooms of Madame C. Desgranges, from Mr. J Wricht, 87. Denmark Road, Camberwell, were of good quality, and it was remarked that the 2nd prize collection came from almont the amme locality-Clapham.
In the stand of twelve blocma of any large-llowering Molyneux, R. Dean, and Louise were prominent. The $\mathbf{R}$ named new variety is a very useful one for early work. The exhibitor of the best lot was
Mise Debeniam, St. F'eter'b, St. Albans, won list place for twelve Pompone, but the claes was not remarkable. The best ix bunches of any yellow varieties, excepting M. C. Desgranges included Mrs, Burrell, G. Wermif, and Mrs. Hartshorn. The collection was shown by Mr. W. C. Pagram, gre to J. Courtenay, Esq., The Whim, Weybridge.
For early work the following six varieties should be useful, as they were shown in the successful stand for that number of distinct varietios, excluding M. C. Desgranges-Miss Anna Hartshorn, B. Dean, Louise, E. Molyneur, W. H. Lipcoln, and Madame Edward Rey. The exhibitor was Mr. Chas. Cox. gr. to J. Trotter. Eeq, Brichendon Grange, Hertlord.
There were few groups of Chryometbemum plants ataged. We noticed one from Mr. Nommar Davis, Camberwell, composed chiefly of plants of the white-flowered Lady Fitawigram, and some Ferne.
Mr. H. J. Jowes, Byecroft Wuraery, Lewioham, had a fair. sized aroup of tuberoue-rooted Begonias, Ferns, Lilium lanciLolium album, and a few Chryganthemums, the whole being very attractive.

## DABLIAS.

These were plentiful, and the quality good. Amongat the principal exhibitors were Mr. CH48. Turver, Royal Nurserien, Slough, who was lst for forty-eight blooms; Mr. JNO. W $A$ LKER, Thame, Oxon, lot for thirty-six blooms; Mr. GEO. HUM blooms; J. Chral \& Sors, Lowfild Nurseries, Crawley, 18 for eighteen diatinct bunches, ke.; and J. Bunamit \& Co Cambridge, list for twelve bunches of Pompons and others. Cambridge, lst for twelve bunches of Pompons and athers, - very large one from Mr. Thos. S. W ARe, Hale Farm Nurseries, near Tottenham; others from Measrs. J. CHEAL S Sows Measrs. DOBBIE CO., Bothesay, \&c.

## Glidioli.

The collection of these that won lat place, was ons from Messrs. J. Burrell \& Co., who staged a good displat, but arranged them in too stift a manner.
Miscellaneous Exhibits included nice collections of fruit from 8. Spooner \& Sons, Hounslow, ad J. Cheal \& Sons; hardy flowers, fruit, f c., from Mesers. J. Lilwg \& Sons, Forent Hill Nurseries; Sweet Peas, from the Brockhampton Nurseries (W. E. Tidy, manager), \&c.

Sbptrmase 3 -There were afew Chryanthemume submitted before the Floral Committee on the above date.

Mr. Jofm Roberts. nurseryman, Shepperton, brought a small white-flowered sport from Madame Deagranges, of Pompon size and shape, very free and useful for cutting from, which the committee wished to soe again. It is named Amanda, and Mr. Roberts stated the flowers find a ready sale in the market. From Mr. H. J. Jonis, Byecrott Nursery, Lewisham, came two early-flowering varieties, viz., Madame Carmviarie, blush; and yellow Pompon Amie Conderchet, which the committee commended in each case.
double form of Anemone japonica named the white sem: double form of Anemone japonica named Whirlwind, the blossoms jure and semi-double, from Mr. Pritchard, nursery-
man, Christchurch. I he same award was made to Mesers. J. man, Christchurch. The same award was made to Meerrs. J.
Laivg \& Son, Stanstead Nurseries, Forest Hill, for Linaris Laivg \& Son, Stanstead Nurseries, Forest Hill, for Linaria Red Bictingheimer, a fine fruit much tinted with red, and partaking of the form and size of Warner's King. From Mr. R. OWEN, nurseryman, Maidenbesd, came four varietiem of early-flowering Japanese Chrysanthemums, and Vote of Thanls was awarded. Improved cups and tubee for Chryeanthemum blooms were shows by Dr. WıLKER, Wimbledon, and Mr. Thos. Jemner, Rocheoter.

A committee of Dahlia experts made the following awards : To Cactus Dablia Mre. A, Beok, bright salmon-red, a true Cactus variety, with some novelty of colour. Single Dahlias Hetty Desn and Pompon Flora, deop yellow, were very
attractive. These were from Mr. T. 8. WARE, Hale attractive. These were from Mr. T. S. WARE, Hale
Farm Nursery. Tottenham. A First-class Certificate of Farm Nursery. Tottenham. A Firat-class Certificate of for Cactus Dahlia Valkyrie, crimson centre, ahading to rosymsuve and blush, very diatinct, a fine Cactus type; aloo to Owctu Dablia Fuailier, pals bright monlet, wary dietinet and

maroon, of fine shape; Fabio, yellow, heavily tipped wilh maroon, of fine shape; Fabio, yellow, heavily tipped with Ganymede, salmon, flushed with delicate mave on the petal dgee.
Somo attractive varietien of the aingle Cuctus Duhlia were hown by Mesers. DobBire \& Co., nurnerymen. Botheasy, but they failed to find favour with the committen.
Three very fine forms of Hybrid Gladiali were submitted for approval by Mesir. J. Bưnill \& Co., nurmerymen, Cembridge, and First-cluss Certificates of Merit were awarded to each, viz., Teree, a pale pink, flaked alightly with dark red-dioh-purple: Bunray, delicate pink, with alight filies af crimen; and Blushing Morn, delionte fienb, with a tinting of pink-a charming variety.

## NATIONAL DABLIA.

September 6, 7.-What with the Royal Aquarium how on the 3 rd, and the above exhibition of the National Society at the Crystal Palace three days later, the Dablia growera bad a busy week. The show and fancy varieties were finer at Wentminater, for the hest and closeness of the atmophere appeared to have told upon them toward the end of the week, and the flowers were amaller, and less Gniabed. The Cactus and decorative varietien were nuperb, however, and the aingle and Pompon varietien very fine.
Show Dahlias.-At the Crystal Palace, Mr. C. TUREER, Royal Nursery, Sloukh, was an easy winner for sixty bloome, ling, very fine yellow belf: George Rawlings, John Standish, an old flower jet still foll George Rawlinge, John _Dtandish. Ly old flower, jet still a ine exhibition rariety; Gloire de Turner, Willie Garratt, Mr, Gladatone the best bloom of his Turner, Willie Garratt, Mrn. Gladatone, the best bloom of his York, in charming tipped fower. Grand 8ultan, Alice Emily, York, a charming tipped fower; Grasd Bultan, Alice Emily, Burgundy, Mabel Tranter, a very pleasing coft primrose-yellow elf: Mrs. Saunders, one of the best fancies. yellow, tipped with white; Diadem. John Walker, the fineot white self ; Shottesham Hero, heavily tipped with roey-purple, very good. Mr. Jnify Walker, nurearyman, Thame, Oxon, was a good
2nd and Mesars. Keynes, Williama \& Co., Salisbuty, 3rd. With forl fow of the finest flowers in the stand being $W$ arrior, Alice Raily, Hope, George Rawlinga, R. T. Rawlingw, Jamee Vick, Shottesham Bero, John Bennett, Mathew Oampbell, Plessaunce, very bright; and Mrs. Gladstone. Mr. J. Wayken was again 2nd: and Messrs. KeyNEs \& Co., 3rd.
With thirty-aix blooms, Mr. George HuMphries, nurseryman, Cheltenham, came to the fore, having well-developed Cannell, William Powell. Harry Turner, Duches Keith, Miss Cannell, William Powell. Harry Turner, Duchese of Albany, John Walker, R. T. Rawlings, Mrs. Mortimer, and Queen of the Belgians; Mr. J. T. Wrer, Cornwalls, Brentwood, wat 2nd: and Messrs. J. Saltmabse Boas, nureerymen, Chelmaford, 3rd.
With twenty-four varieties, Mearrs. SaltmansH a Sons Were lot, with a very good otand, their loading flowers being Colonist, J. Hickling, A. Rawlings, R. T. Kawlioge, John Walker, Prince of Denmark, William Rawlings, and Alice Emily: Mr.J.T. West, who was 2nd, had the following very cood, W. Powell, John Walker, Harry Tumer, Queen of the Belgians, Shirlej Hibberd, Mise Cannell, Jobn Hickling, and Mrs. Gladstone: Mr. G. Humpheies was 3rd.
 Nursery, was lst, the stand containing good examples of Mrw. Gladstone, W. Rawlings, Arthur Ocock, George Rawlings, R. T. Rawlinga, and John Walker: Mr. ARTMUR, Florist, Romford, was 3nd.
In the amateurs' division for twenty-four blooms, Mr. Thomas Hobb3, Lower Easton, Bristol, who has been showing remarkably well this sesson, was 1st, with capital blooms of Henry Glasscoct, Duchess of Albany, John Henshaw, Alice Emily, Hartie King, Prince of Denmark, Harry Turner, T. W. Girdlestone, Geo. Rawlings, Mrs. Gladstone, and Willie Keith; Mr. L. FEwres, Castle Bromwich, Birmingham, whe 2nd ; and Mr. T. Anstiss, Brill, 3rd.
With twelve blooms, exclusive of fancies, Mr. A. Starling, gr. to H. H. Rapkaze, Req., Hevering, was let, his leading
fowers being John Walker, Wm. Rewlioge, J. T. Week, James Vick, R. T. Eawlings, Colonis, and T. W

## Clippenhem; Mr.

## was 2nd.

Fancy DaAlias.-Mr. T. Awsirss, Brill, had the best twelve blooms, Dundy, Erince Henry, Mr. Satunders, and Matihew Campbell being very good : Mr. S. COOPER, Chippenham, was 2nd. For six blo
In the open clames for Dahlias in colours, the best six. blooms of any dark variety was Willie Keith, from Mr. C. Turner; Mr. ©. Montimer, Farnham, was 2nd with Jamee Cocker Several other varieties wero bhown. The best light, not yellow, were those of John Walker from Mr. Walker: Mr S. MORTIMER was 2nd with Mra. Gladstone. There were ather exhibitors, but these two varieties only were shows. The bet six blooms of a yellow came from Mr. Whleen, who
had W. Powell; Mr. MokTiMER was 2nd with John Hickling.
B. T. Rawlings and Buttercap were also shown. The best ipped Dahlia was Mrs. Saunders, sir excellent blooms being hown by Mr. M. V. SEATE Sevenoaiks: Mr. MORTIMER cam and with Mre, N. Halls, Mr. G. Humperbies had the best si= loome of a triped Dahlia, showing Frank Pearce in very fine Maren Wr. Wires was with Mathew Camphell The best-edged Dahlia was Miss Cannell, from Mr. J. Walker Mr. J. T. W IST coming and with his namesake.
Cuctus Dahlias. - In order that only true forms of th Cactustype should be shown in this class, a list is published in the schedule of prizes of those eligible for exhibition in thi class. With eighteen varieties in bunches of six blooms, Messrs. T. Cheal \& Soys were 1st, having superb examples of Mrs Wilson Noble (new), very fine ; Harmony, Earl of Pembroke Delicata, Lady Penzance, Matchless, May Pictor, Bertha Mawey, Countess of Goaford, Mrs. Gordon Sloane (new), and Purple Prince. Messrs. Keynes \& Co. were 2nd, having differen rom the foregoing:-Fusilier (new), very fine; Mrs. Barnes, TURNER. With twolve bunches, Messrs. J. Burbell \& Co. hureerymen, Cambridge, were 1st, having Gloriosa, Countes of Gosford, Rarl of Pembroke, Mre. Peart, Delicata, Lady Penzance, Mayor Haskins, Robert Cannell, and Mary Hillier Mr. J. T. West, was 2nd, having fine bunches of Miss A Nightingale (new), Miss Annie Jones (new), Mary Hillier, Gloriosa, Matchless, and Delicata.

Decorative Dahlias.-In the class for twelve bunches, no Cactus variety could be shown, but Mr. C. Turner had to be diequalified through inadvertently staging a Cactus form. Mesars. J. Cheal \& Sons had the best twelve bunches, the most striking rarieties being Arthur Cheal, Chancellor Swayne Mrs. Hawkins, Harry Freeman, Maid of Kent, Amphion, and Lady Primrose. Mr. M. V. Seale was 2nd, having, of good rarieties distinct from the foregoing, Baron Schroder, Mar chioness of Bute, and Sir Roger
Pompon Dahlas. - There were very few shown, Mr. C. Turner taking the 1st prize for a collection of small-sized flowers, beautifully fresh and bright, including Nerissa, Fabio Bacchus, Ganymede, Douglas, Purity, Geo. Brinckman, Ruy Blas, Jessica, Crystabella, Eric, Amber, and Iola, edged with bright purple; 2nd, Mesors. KEYNES \& Co., their best varieties being Madge, Tommy Keith, Irene, Arthar West, Lilian, Janet, and Model.
With twelve bunches, Messrs. J. Burraid \& Co. were lat and Mr. J. T. Weer 2nd.
Single Dxhlins. -These atill hold their own, and they were shown in very fine condition in twenty-four bunches. Messrs. J. Creal \& Sons were placed 1st, the most distinct being Miss Henshaw, Gulielma, M. C. C. Formona, Miss Glasecack Misa Roberts, Victoria, Phyllis, Marion Hood, and Northern Star; 2nd, Mr. Sexter who had in good character, diatinet from the foregoing, Mrs. Parrot, Miss Jeffried, Duchess of Albany, W. C. Harvey, Eclipse, and Evelyn. There was no entry in the class for twelve bunches
Cactus and Decorative Duhlias.-With twelve bunches, Mr J. STREDWICK, St. Leonards, was 1st, having very good bunches of Gloriosa, Delicata, Countess of Gosford, Bertha Mawley, Harmony, Juarezi, and Lady Penzance; Mr. E Brown, gr. to M. W. Morris. Req., Horley, waa 2nd. With six bunches, three blooms of each, Mr. E. Mawley, Berkhamsted, was 1st: and Mr. S. Cooper 2nd. With six arieties of Cactus only, Mr. J. Stredwlck was 18t; and Mr. E. Brown 2 nd.

Mesara. H. Canyeri \& Sons offered prizes for four bunches of Cactus Dahlias sent out by themselves, Mr. W. Mist being th only exhibitor, and took the lst prize.
Pompon Dahlias, Amateurs.- With six varieties in bunches, Mr. J. T. Hudson, Gunnersbury, was 1st with some excellent howers; Mr. J. Stredwick taking the 2nd prize. With six bunches, six bloom in each, Mr. S. Cooper came 1st, and Mr G. WYatt. Twickenham, 2od.

Single Dahlias, Amateurs. - In the class for sim buncher, ten looms of each, Mr. T. W. Grrdlestone, Sunningdale, was 1st, with Kitty, Soubrette, Golden Locks, Dearest, Prince of Waltes, and a seedling; Mr. C. Osarav, Sutton, was 2ad With ix bunches, six blooms in exch, Mr. E. Mawley 1st, and Mr. W. Parrott, Sevenobke, 2nd. With twelve varieties of single fancy Dahlias, Mewry. J. Chear of Sons were the only exhibitors, and they had Phyllis, Mrs. Harris, Ired Leslie, Alice Searle, Mrs. W Ythes, Misa Glascock, Mey Gharpe, Dearest, and James Scobie in excellent form.
following : Show amber centre, six fine blooms of Globe, bright yellow, with (G. Harris, Orpington): Cactus, Beatrice bripht ow lilac, trae Cactas, very distinct and attractive (C. Turnfr, Slough): Cactus, Henry Stredwick: dull crimson, flushed with maroon, becoming brighter with age, true Cactus (J. STRFD maroon, becoming brighter with age, true Cactus (J. STRFDslight darkshading, true Cactus; Mrs. Wilson Noble, salmon rose, very distinct, and extra fine, a true Cactus (J. Crild a Sons): Cactus, Miss Annie Jones, brigbt palescarlet, a true form; and Mise A. Nightingale, salmon-red, deepening in colour very distinct, true Cactue (J. T. West, Brentwood) ; Wrs. A Beck, bright pale orange-red, a fine true type (T. S. WARE) Fosarlet, very fine, and distinct and true; Grenadier, pale saarlet, very fine, and eftective; and Boyal George, lively Wrhenams a Co., Sallabury) Tectu, Fery distinct (KEYNES deep maroon, swall, fane shap). To Pompons, Douglas, bright deep maroon, skall, fine shape; Norissa, soft rosy-pink, very pleaking. small; and Ganymede, solmon, flumhed on the ery Rosetud, pal R Rosetud, pale rround, heavily tipped with erimenpons fine shape, very pretty ( $\mathcal{J}$. Ofzex \& Sow). Erimann-purple pale grovind. flaked and peacilled with ormeoge. Soubrette

Beanty's Eye, soft pink, with a ring of orange-crimson round a golden centre (E. Mawley). The forego
made by a large committee of Dahlia experts. , Laing \& Sons, Forest Hill leading the way with a group of Camellias and one of Gloxinias, the latter from seeds sown in spring, all showing high quality. Mr. M. PRITCEARD nurseryman, Christchurch, had a collection of hardy cut flowers; Messers. DobBIE \& Co., seedsmen, Rothesay and Orpington, had cut Dahlias of various types, including a collection of the single Cactus types; Messrs. H. Cannell \& Sors, Swanley, a collection of bunches of Cactus and decorative Dahlias: Messes. CHeal \& Sons, several stands of the same Mr. T S WARE, Tottenham, a large collection of Dahlias M. N. Warf, Lottenham, a and Messrs. J. Peed \& Sons Lower Norwood, Dahlias and cut hardy flowers

## GLASGOW HORTICULTURAL

It was admitted on all hands that the excellence of the exhibite generally at the recent show wa equal to anything that ham been seen in the West of Scotland previously; the enthasiasm of the citizens has been aroused somewhat by the attention now given to horticalture in the case of parks and botanic gardens. The nurserymen and floriats did much to make the diaplay a good one.
Enclosing the orchestra was a great display of fine-foliage and flowering-plants, staged by Messrs.'Austin \& MCAustlim who also had two tables with choice selections on each.
Messrs. Thyne made their usual exhibits of Crotons, Dracæenas, and Palms, and other suitable plants, including numerous Lalies interspersed in the exhibit, which enhanced its appearance.
table of choice plants came from Mr. Dewar, the Curato of the Botanic Garden, who throws great energy into the work of the exhibitions. His table was rich with Marantas, Bego nias, Alocasias, Alloplectus Lynchii. Zingibers, and other зресіes.
The tables furnished by gardeners in competition were all arranged with taste, but variety was to some extent wanting. Crotons, though of the finest colour, should not be included in group withont any regard to proportion. Mr. HUGH McGulley, garden er, Langside, was 1st.
Orchids were few in number, but the plants were good and well-flowered. Mr. D. Wilson, gr., Westmount, was let fo three plants. Odontoglossum Pescatorei had one spike of large size, with flowers finely developed. Mr. Geo. Westors Pollickshiels, was Ind. The competition for one Orehid was only engaged in by three ezhibitors. Ferns were not eo numarous as at some former exhibitions, but the excellenc of the plants was remarkxble. The Gleichenias of Mr. JoH Mitchell were excellent.

## Cut Flowers

Passing to the adjoining hall, a grand display of cut flowers was seen. Much labour had been expended by the exhibitors in protecting their flowers from the drenching rains. Mr Forbes, nursoryman, Hawick, had a display of spikes of Hollyhocks, Antirrhinums, tec., and Carnations in quantity. Gladiolus were as fine as we have seen them in Scotland Mr. Smite's 1st prize stan? was remarkable for cleanness ive, and fine form. Mr. M. CAMPBELL, nurseryman. Blantyre had a large and choice selection of Carnations, Cannas, \&cc His bunches of Carnation Valkyrie were much admired. Cannas rich in colour were Madame Soubeyrand, Lutea plendens, Exploratur Crampel, and Madame Crozy. Mr Campbell had also a capital collection of Dahlias,
In another hall Mr. Cutebertson had a display of herbaceous plants, Liliumas, Phlozes, Helianthus in variety, Tritomas, Coreopsis lanceolata (one of the best flowers on thi gorgeous table, 26 feet long). Pansies in quantity, and thei new Violas, Mrs. R, K. Mitchall, William Haig, aud Sweet ness, were woll exbibited. Me, Smellie's Pangies, in such variaty, made a great show; Viola sprays filled long tables Mesors. Dobbir a Co., of Rothesny, staged a large exhibit embracing great variety. Cannas were very attractive: Queed Charlotte, Madame Crozy, and Premaier de Neice are very pretty varieties; Cactus Dahliau, including such attractive varieties as Sir Walter Scott, Diady Dinmont, and Pirate, were beautiful and distinct. This exhibit was backed with a selection of Puchoiss in pots. A selection of Celery, red and selection of Fuchsias in pots. A selection of Celery, red an
Asters, Sweet Peas, Marigolds were passed, and then we pruqed to see the fine exhibits of Roqes. Messrs. COCk Sovs, Aberdeen, had a lst prize lot, which at any season would be considered firat-rate; Captain Hayward, Caroline Testout, Mrs. J. Laing, Gustave Piganneau, Alice Brunner, Louis van Houtte, and Prince Arthur were amongyt the finest blooms. Mr. Crolir, Dundee, had a good collection, being und.

Fruit.
There was the uswal excitement over the exhibite of fruit The display of Grapes was equal to that of former years Black Hamburghs were remarkably fine in colour and size of berry, well as in bunch. Mr. MENzTES, Dunipace Gardens, was again lat, a powition which he has held for three seacons past; Mr. Whitw, the Castlo, Large, was a good 2nd.
In a clase for any Grape other than Black Hamburgh, Mr THomgow, ke. at Wheatlands, had a pair of mrand banches of Muscat Hamburgh, which excelled the Alicantien, Madresfield Court, and othery; Mascat of Alexandria was largaly repre erted. Mr. KTPD wne lot with fae exmples from Carbery Towers; Mr. McCowocite, Cumeron House, wac i good 2nd In the claes of four bunches Mr. Litsert, Fitcallen, Perth, was

1st, his Madresfield Court, Muscats, Alicantes, and Gros Mwo being of great merit; Mr. MCCONOCHIE was a close 2nd.
The collections of fruit were good. Mr. D. MUrray, Cul zean, was 1st for thirteen dishes, all of much excelleme, ood smooth Cayenne Pineapple, capital Noblease Peachem Elruge and Pineapple Nectarines, were among the beat freith hich this exhibitor ever tabled; we have seen finer Grpes from Culzean. Mr. McBean, Craigends, was 2nd, hie Gmpe ing his best dishes
In the class for six sorts, Mr. LesLiE, Perth, wat let, hit Peaches were remarkably fine; Muscat and Black Hambay Grapes good; Mr. Hallidiy was 2ad. Melons were nome ouq and were jindged uncut. Peaches were finely coloand and Mr. McBeav's six fruits were large, and had lat priza Plums and outside fruit generally was not of more than avetas in quality. Apples of the larger kitchen sorts were very fim and more highly coloured than we should have expected. Smitir, Roselea, had two dozen splendid Apples.
Vegetables were excellent. Mr. Mobean had 1st priva fer hirteen sorts, which were of the highest merit, and the Vaith Memorial Prize was also awarded him. The 2nd prize went Mr. Browr, gr. Houston, for a collection little inferioe McBean's. In the class for siz sorts, Mr. McBear wall and Mr. Brown, 2nd, for Messrs. Sutton's prizes. Calms Onions, Leeke, Carrots, and the fifty pots of Parsley, wend finest quality. Altogether, the exhibition was satistudery to all.
The judging of baskets of flower bouquets, sprays, crom ce, which was done by ladies, require much patience al knowledge, as the numbers and variety were bewildering
A novelty in economics was the exhibit of teakwod pote Orchid stakes, \&c., from Mr. Jornston, Paisley. The dart ness of the Standrey Halls is much against the appearance 0 such a grand display

The term "socumulated tomperature" indicates the agat gate amount, as well as the duration, of the pais named : and this combined result is expresed ir hy wenty-four hours or any other number an inversely proportional namber of hours.

## TH B PA8T W EEA. 保

The following summary record of the weather fis furnithed the British Islands for the weet on

The weither continued very fine and dry genesilly mir great*r part of England until the night of the 66h, mish aevere thunderatorms, socompanied by heary were experienced over our southern and eastern co most parts of Ireland, Scotland, and the north-west o the conditions were again

- The temperature arceeded the mean fa all district
exceas being as much as $4^{\circ}$ or $5^{\circ}$ over eastern, southem, and runtral England. The highest of the maxima, which were recorded on rather irregular dates, varied from $85^{\circ} \mathrm{in}$ ' Eng . lans, F.,' $a_{4}^{\prime}$ ' in the 'Midland Counties,' and $83^{\circ}$ in ' England
 The lowent of the minims were registered at the beginning of the wefk orer England, but towards its close over Ireland and Scotland; they ranget from $34^{\circ}$ to $35^{\circ}$ in Scotland, from $40^{\circ}$ to $42^{\circ}$ in Ireland, and from $38^{\circ}$ to $46^{\circ}$ over England; in the 'Channel Islands' the lowest reading was 5

The rainfall was less than the mean in most districts, but just equallet it in 'England, E. and S.o' and exceeded it in 'Scotland, N.' and ' Eagland, N.W.' At all our most southern and south-eastern stations, the only rain occurred during the thunderstorm noted above, when large amounts ware reported is many place

The bright sumshine exceeded the mean in all district encepting 'Scotland, N." The percentage of the possible duration ranged from $63 \mathrm{in}^{4}$ England, 8.' and the "Channel Islandn, and 62 in 'England, E." to 40 in "England, N.E." and ore Ireland, 35 in 'Rngland, N.W., and 28 in 'Scotland, $\mathbf{N}$.

## HAY

Averages.-The following are the averages of prione at the principal metropolitan markete during the past week:Clover, prime, 90s. to 110 s ; do. inferior, 50 s . to 80 s . i hay beet, 60s. to 908 . ; do., inferior, 36s. to 60 s . ; mixture, 70s, to 92 s .6 d . ; and Straw, 20s. to 38s. per loed.

- Owing to the large increase in our circulation, toe are reluctantly under the necessity of goinp to press some houre earller. Our contributors, who wall know what this implies, will kindly aid us by sending their communications as carly in the week as possible. Communications should rench us not later than Wednesday.
- Plants, FRuts, MTO. To Ba Named.-Correspondents sending plants or fruits to be named, or asking question demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered and not more than six should be sent at one time. Leaves only, or
Apples: R.N. Apples are frequently preserved by drying for fature ase in this country. The method of doing this have been repoatediy written upon in these pages, and we may refer you to our insue for Dec. 5, 1891, p. 680 and p. 53 of ame volume. In the latter page is also figured s very convenien machine for evaporating fresh fruit. It is manu factured by Ph, Mayfarth \& Co., Frankfart, and may be had in suitable sizes for tresting amall or large quantities. Oae of thene machines was at Chinwick for some time, and the result was very satisfactory. Further references in Gardeners Chrowicle are Sept. 10, 1892, p. 308, and Oct. 22 1892, p. 497. You might obtain all information in regard to fruit evaporation by writing to Mr A. Ludwig, F.R.H.S., 16, Mincing Lane, London, E.C.

Astras: G. S. Your Aater roote are attacked by yruos allied to theme of the Cockchafer, probably those of the Cockchafer itself. R. McL.
Berberis: Dummy. Please catch the insect, and we will endeavoar to name it for you.
Books: E F.B. 1, The London Market Gardens, by C. W. Shaw, puilithed at 37, Sjatbamptoa Sireet, Covent Garden, W.C. This book may not give you all the information you require, but it is tho beat wo can recommend yon. 2. Hawdy Book of Bees, by A. Pettigrew, publiabed by Wa. Bleck wood \& Sons, E linbergh and London.

Cannations: A. J. $H$. Imposible to form an opinion; the flowers were dried to tinder.
Emplotment in America of the Colontes: Gatdener. We possess no convenient mesn by which to transfer young gardeners from sitaations in Eagland to aimilar employment in America or the colonies. There are racancies frequently ariving for nuitabla men in such places, as ovidenced by advertiaement which appear in this and othe Journale. You would do well to advertiae, or write to some of the leading narserymen in the country you wish to remove to.
Ficus elastica: J. E. P., Altrincham. The plante of Ficut elastica were probably grown on bottomheat or in a very warm house before you got them, and the chinge has caused the damage to the young growthm. When the plante get catablished with you they will no doubt thrive.
Fucasias: W. R. Flowers quite withored; send them to nome grower of thee plants.
Haw's Patent Watering.can: W. C., Jamaica. These cans may be obtained through most of the horticultural andriesmen.
Molberey Leatrs: E, C. C. D. Not at all uncommon, eapecially on the etronger growing shoots.
Mumay Pia: H. Stark noneense, often exponed in these columns. The Peas are "fasciated," as often happens when plante are grown vigorously. The condition has become hereditary. The plant has been figured in our columne as the Crown Pes.
Names of Fruits: (see notice under Names of Plants). Croft. 1, Bienheim Orange; 2. Court of Wick 3. Callini; 4, Manx Cudlin; 5, Golden Noble 6, Fearn's Pıppin; 7. Damelow's Ssedling.-J. $P$. 1, Hawthornden; 2 Ribston Pippin; 3. Fmperor Alexander; 4. Cellini; 5. Gloria Mandi; 6, Small's Admirable.-J. A. F. 1, New Hawthornden; 2. Tower of G!amis ; 3, Lord Gronvenor ; 5 Lord Darbs; 6. Dimelow's Ssedling.-C.E.' 1 Gravenatein; 2, 3, not recognised; you should end better pecimens.-T. $K$. Apple Yellow Ingeatre. Pears amall, and partly decayed. We cannot name ach frait.-H. Humphreys. Pear Baurré Clairgean.-A. J. B. Peaches all braised beyond recognition during transit. - F. $F_{\text {. The }}$ Grapes sent are undoubtedly Black Hamburghn, but not yet quite ripe ; other frait next week.
Nampe of Plants: Correspondents not answered in this issue are requested to consult the next number. Bloomfield. 1, Caryaanthomam lacuatre; 3, Tradeacantia virginica; 4, Agathea coelentis ; 5, Montbretia crocomillora; 7, Kerria japonica; 8 . Leycesteria formosa; 9, Asphodelunluteus. Two had no labela, one Solidago canadentis, the other Alstromeria paittacias.-S.W. O. H. Clethra arbores. -Northleigh. Cævalpinia pulcherrima.-R.R. 1 , Soires D juglasi ; 2, Asclepias incarnata; 3, Dracocapbalum virginianam; 4, Centararea macrocephala; 5, Kerria japonica variegata; 6, Periploca greca.-C. A. Datura Stramoniam, Thorn Apple.-C. W. 1, Spiræa Thunbergi 2, Enonymuer radican: 3, Retinospora aquarros 4. E'sugnus pungen: var.; 5, Olearia Haswi 6. Skimmia japonica. - Mrs. H. Hieraciam aurantiacum.-G.B.S. 1, Codonophie ovata (ree fig. 59) ; 2, Scatellaria, probably S. columng; 3

Fig. 69.-codomopgis ofata : FLowerg pale blut, fetto.

Hieraciam surintiscam ; 4, probably Pammaivis Hookeriana, allied to Vaccininm: 5, Genieta tiactoria; 6, Antrantia major: 7. Daranta Plamierii, - H. Fo, Jeede, Zygopetalum Mackajil.

Nectarine on Prach-tree: James Vert. Such a circumstance does not commonly occur, bat inetances have again and again been recorded. We have observed one case this season ourselves in the nursery of Mr. Walker at Ham Common, where both fruits were to be seen on the same ahoot. We were afterwards informed by Mr Walker that the fruit had fallen during stoning In the Gardeners' Chronicle for Jaly 13 last, we figured a composite fruit with well-defined sections of Peach and Nectarine, and this we think is even more remarkable than the other case. It goes to prove that there is no real or botanical difference between the fraity, and the one may revert to the other apon occasion, but at present we have no knowledge as to the precise circumstances that tend to this reversion.
Nicgolson's Dictionary ": N. C. It would be a very large book indeed that contained the name of every plant. Mr. Nicholson's Dictionary professen only to include the names of plants that are worth cultivating in gardens, and a very liberal idea ha been followed in regard to anch. Senecio viscons and Chenopodinm polyspermum are British plants-weeds, if we may use the term and deacriptiona of them may be found in Bentham and Hooker's British Flora. Nicotiana rustica is a pood name, and is mentioned in the Treasury of Botany, and later in Index Kewensis, the standard work on horticultural nomenclature.
Packing Grapes: Old Packer. In our opinion the method you describe is not a good one. There thould be much less material about the frait, no tying at the endr, and the banche should not be laid on top of each other, as it would appear from your deacription they are placed, in the case you speak of. Many excellent aytem of packing Grape for railway tranait have been deacribed and figured in theme column. See reference given to a correspondent in our last isere.
Plums: R. N. H. The Silver-leaf divese-the cause in not known. There is no fungus.
Roors: J. McL., Ireland. Dynamite, or gunpowder, but preferably the former, is frequently used in order to blow up the roote of large trees, which have been felled, and by such means a great saving in labour in made. If you have had no previous experience in such an operation, however, we cannot advise you to employ these explosives, unless you obtain the assistance of some one who thoroughly understand their use.
Solss: K. M.G. We do not undertake to analyas coils, bat you would probably obtain the analyais of a ample by zending it to Dr. Djer, Great Tower Street, London, E.C. The fee will be from one to two guineas.
Vinery Infested With Insect Pests: T. O. From the description you give of the lesves it is Jukely that mont of the injury reault from red-apider, but if thrips and acale are very numerous also, there will be considerable difficulty experienced in saving the appearance of the Gro Colmar Grapes. You might try the aulphur cure in order to get rid of the apider, adopting the unal method of heating the hot-water pipes very hot at night, and daubing them over with sulphar, at the aame time kefping the house clowed during the operation. At the Grapes are colouring, you mant be careful in any process that it be not overdone. Sponge the foliage frequently, and if time in not available to go over all the folinge, aponge around each bunch of fruit, and when the crop has been gathered, more dratic methode can be adopted.

Gardeniges and others Wanting Situations. 26 words, including name and address, 18. 6d., and $6 d$. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.
Notion to ADVRrtisers. - In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.
Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish ropeated.
Position.-Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.
Postal Orders.-To Advertisers, Subscribers, and Others.-It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to A. G. Martin, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.
N.B.-The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.
Advertisements for the current week MOST reach the Office by first post, Thursday morning.
All Advertiaemanta should be addreansd to the PUBLISBER
Publishing Office and offce for Advortisomente, 41, Whlington Steser, Strand, W.C.

SATURDAY, SEPTEMBER 21, 1805.

THE ROSE SEASON OF 1895.

AFTER all, we can say with some degree of oonfidence, that the past summer has been far from a bad one for Roses. The prospeots after the frost broke up were not reassuring; complaints oame from all quarters of the heavy lom and damage whioh had resulted. Some of these were ourious, for results were very different in the same districts, and the difference could hardly be traoed to soil or position. A warm and dry spring without an exceptionally sharp late frost, furnished the best possible result from the little wood that was spared, and one of the features of the season has been the beauty of the garden or decorative Roses. Many of these are not only less hardy of themselves than others, but their long growths are more fully exposed to the weather. Muoh of the injury during the frost was oaused by the sudden and extreme ohanges in temperature. At night a frost of about $20^{\circ}$ or more frequently ooourred, and day by day during a few hours at mid-day the wood was thawed, and upon walle a warm temperature produced by the brightness of the aun. This alternate freezing and thawing was most harmful, and as we ohiefly grow our olimbers and garden Roses upon walls or in sheltered places, they naturally suffered severely. Under such oiroumstanoes, it was surprising to see garden Roses so good as they have been. At the earlient and latest shows they were as good as in any previons season. Some of this may be the result of their more extended culture; still, there is the fact, that at Gloucester and at Derby we saw some truly splendid stands of garden Roses.

Teas and Noisettes, too, notwithstanding the idea (atill more prevalent than I could have credited) of their extreme tenderness, have been very good. Undoubtedly, the best of these were seen at Glonoester, although some good blooms were exhibited at the National Rose Sooiety's meeting at Derby. I think the oompetition at Gloucester, the Crystal Palace, and Derby, as well as the many other Rose exhibitions held in the country, was greater even than usual, while in many oases there were more exhibitors than I expected. But here, in mid-Sussex, we had a worse time than many of my rosarian friends. Upon all of my maiden beds the effects are still seen. Even now many buds and breali upon standards and half-standards are disappointiagly puny. It aeoms as though the cold had pinched or bound the barle in suoh a way, that it was unable to swell and allow of a healthy junotion and growth of Rose and stock, while in a large number of cases, the dormant bud was killed outright. At pruning-time I did not expect to see so good a Rose season; indeed, it seemed quite impos,ible under the most favourable conditions of spring and summer. But we have few flowering shrubs that recover so quickly as the Rose. This more eapeoially applies to the Teas
and Noisettes. No doubt many of ns, too, were led to give a little extra care and attention to our Roses after the severe ordeal they had gone through.

Growth, enpecially that of the later breaks, was healthy and clean, there being lens maggot and fly than uaual; but as the meason advanced, I was much troubled with the tem-boring saw-fly and amall Rose-chafers. Later still, we had a swarm of small hard bage, a ministure beetle in sppearance, which injured the blooms badly. They were even worse than the large and dark brown thrips sometimes experienced, which are ach a nuisance among our lighter-coloured varieties late in the season. A rather prolonged droaght then checked growth aerioualy, just at our first crop of bloom was being realised; but the rain which followed upon the warm ground caused a very apeedy change for the better. During this change, mildew, at usnal, sppeared. I have had many enquirie of late for a recipe for mildew outdoors. Many remedien have been tried, bat none reems to me to be effective unlens under glame. Nor can we expect to eucceed so long an the main cause are bejond our control. We can do something, however, by chooving siten that are not naturally draughty; and by avoiding the other extreme, namely, a close and waltry atmomphere at midday, with a great change at night, as is experienced in Rose garden that are much enclosed. More especially is this extreme noticeable in the late anmmer and autumn, when we are always more affected with mildew than at other times. Then, again, we ahould not plant that victim of mildewHer Majenty-among other Roses. Innocente Pirola and Souvenir de Paul Neyron are also very anbject to attacks, and it seema a mistake to place them among a general collection, which in many casen would have got the better of a slight attack if anch contagions company were not present.

Writing of Her Majenty reminds me that this variety wat the Rone of 1895 . We generally find one or more Roses atanding out conmpicuously among the rest, and Her Majesty has done so during the past nummer. It won the medal as being the best Hybrid Perpetaal in the whole exhibition at the Cryatal Palace, taking this honour both in the nurserymen's and amatearn' division. We had one more Rose take two of theme silver medals during 1895, once at the Palace and again at Derby. This was Comtesse de Nadaillac, but upon neither occasion was there that depth of colour so remarkable in the Comtense as grown at Oxford. Rarely is there a season When thil grand Tea doen not carry off one or more silver medaln. While we have a few mont pertiatent winners of thim honour, auch an the Comtesse, Horace Vernet, The Bride, Catherine Mermet, A. K. Williams, and Souvenir d'Elise Vardon, there is frequently some very little-known variety which in capital for a season, and then drops almont out of knowledge in the course of a few season. Lat year we had Marguerite Boudet, this sesmon it wat Comtense de Ludre. While there are many grand Rones that one might expect to appear year after year, Comtene de Nadaillac, Xavier Olibo, and A. K. Williamt are the only three that figure among thim and lath season's twelve Silver Medal Roses of the National Rose Society.

A new feature deserving mention is the giving of a gold medal to be held permanently os a memento of winning the champion challenge trophie in either nurwerymen's or amateurn' divisions. A year's poneanion of the trophy alone, certainly seemed inadequate, and I am glad to see thil change. Bat what ure we to do in the case of past winnern? For example, Mr. B. R. Cant, who won the trophy this ceanon, and wecured the Gold Medal first offered, also won in $1881-8<-83-85-86$, and ' 91 . It might have been an entirely fresh winner, and in such case he would have held an equally valuable proof of success. If the funde should allow, it would be gracefal act to present a Gold Medal for each paas maccess, or else one to each winner, inncribed with the dates of previous nacceases! Memurn, Harknems \& Sont have
won challenge trophie upon nine; Mr B won challenge trophie upon aine; Mr, Bon, Cant,
nine; Rev. J. H. Pemberton, five; and Mr. E. B. Lindsell six occasion. These are the mont frequent winners, but quite half-a-dozen other growera have held this trophy for more than one season.

The Gold Medal for a new Rose was awarded to Helen Keller at the Derby meeting, and here we certainly saw this variety in better form than at the Cryatal Palace. It in a splendid Rose, and good in growth; and some wood which has reached me is ample proof of this. New Roser were an exceptional feature at the metropolitan meeting, and probably the beat $t$ wolve that have been seen were ataged then. No fewer than ten out of the dozen were raised by the exhibitors-a record among new Roses, for we must remember that Ethel Brownlow (one of the Silver Medal Teas of 1895), Margaret Dickson, Earl of Dafferin, and several more grand varieties raised by the amme firm were not elegible in this atand.
Of the new Roses, I like Helen Keller, Marchioness of Downehire, Marchioness of Londonderry, Avoca, Marquise Lita, and Mra. R. G. Sharman Crawford, with a decided preforence to the latt-named Rose. A port from Catherine Mermet, called Mariel Grahame, is not yet in commerce, but it will make a capital Rose if we are to judge from the blooms exhibited.

I cannot leave the new Roses without once more directing attention to a new Hybrid Sweet Briar, called Jeannie Deans. There is, perhaps, too close a aimilarity between some of the lighter ahades in this new class of Rosen, but no complaint of that kind can be attached to this very bright and nemidouble variety.

Retarning to the garden, I would like to call attention to the freedom from red-rut among our Hybrid Perpetuala. The true Teas and Noisettes are not troubled with thim enemy, nor are several of the Hybrid Teas and the Ragona varietien. By the way, Rona rugosa calocarpa is mont distinct, and I believe will be very popular. Perhap no Roses are more generally liked than these, when once they have been grown. Always gay from the time leaves are put forth antil winter is with $u$, in bloom, berry, and foliage ; thoroughly hardy, good in town or country, and never attacked by mildew or red ruat. I should find it a difficult matter to choose a flowering shrab of more reliable and lasting decorative value than these Japanese Rosen.

Although I have headed this article the past Rowe season, a plentiful apply of bloom in atill with na, and as time goes on and we get improved varieties, our season get considerably extended. Still, the Rowe season proper is undoubtedly past. Teas and Noisette chiefly figure among our late ammer and antumal Roses-indeed, I have the fourth diatinct crop of William Allen Richardson upon an outaide wall; and it is the amme with many varieties in these classes, and among the beat of the hybrid Teas, wach as Viscountess Folkestone, Caroline Teatout, Gastave Regis, and Marquis of Salisbury.
There is a great improvement in the appearance of Rose-stocks, and our forebodings of epring, when the dry weather threatened little growth, and therefore the risk of a amall percentage taking the bud, have now happily been dispelled. Nor have I meen the bude in better condition than at present. Lateplanted atandard Briars did badly; bat those set-in during early winter are fairly good $\mathcal{A}, P$.

## New or Noteworthy Plants.

MASDEVALLTA LAWRENCEI, Kränzlin.*
This plant in in foliage and wise like a mall specimen of Masdevallia tovaren*is, and the flowers, Which are $\frac{7}{}$ to $\frac{1}{3}$ amaller, have also a slight rememblance to this apecien. They arise from the top of the flower-atalk successively, and not at one

[^27]time, an in M. tovarensis ; and an examination showe that the resemblance is merely superficial The tube of the flower is covered inside with numerous snd beartiful epottings, but with a lean of some power these spottings prove to be little warth, with a serrated surface; the lateral sepals are widsly separated, and the dorsal one is united with the two others for nearly it whole length. The petals and the lip are rather thick and flesby, the lattec thickened and eerrated at the apex. I believe thin is the plant which Mr. Rolfe named Matevalia guttulata in Gard. Chron. Sept. 6, 1890, ii, p. 2m, The name has to be changed because another apacies, under the name of M. gattulata, was pabliahed by Professor Raichenbach in 1877 ; the latter is quith a different plant, and more in the way of $\mathrm{M}_{\text {, has. }}$ charis, Rehb. f. The only resemblance consided it the small spotiting on a white groand. I am indetad to Sir Trevor Lawrence, Bart, for fresh material d this interesting specien, F. Krämzlin.

## Staprlia longidens, $N . E \cdot B r$. ( $n$. ap.).

This species is a native of Dolagoa Bay in Sontheast Africa, where it wal originally diccoved by Mrs. Monteiro, who eent flowers of it to Ker in 1883 ; aince then it has been introduced into cultivation by W. H. Tillett, Esq., of Norwich, with whom it first flowered in October, 1892. So far a the sppearance of the stems is concerned, it is one of the mont remarkable epecie of the genus knom to me, on account of the very long teeth of the tem; the only other epecien that appronchen it in this character is S. Woodii, to which it is the mont nearly allied, bat the teeth are mach longer than in that apecien, and the flowers quite distinct. The following are its characteristics: Stem glabrow, green mottled with purple, $2 \frac{1}{2}$ to 6 inches long 4 to 5 lines thick, obtasely foar-angled, the angla with long, ascending, atout teeth, $\frac{1}{2}$ to 1 inch long, and about $\frac{1}{8}$ inch thick at the bave, terete, gradualls tapering to a fine soft point. Cymes reuile, neveral-flowered. Pedicels $\frac{8}{4}$ inch long, 1 lins thick, glabrous. Sepale 4 lines long, 14 line broad, lanceolate acaminate ; corolla $1 \frac{1}{3}$ inch it diameter, quite glabrous, with a campanalats tabo 21 lines deep (the bottom of it raised up 30 as to form a convex cuwhion aupporting the corona), and horizontally preading lobes $7-8$ linen long, it -5 linen broad, ovate-lanceolste scute, flat ; the colont is pale greenish-yellow, spotted all over with dark purple-brown (cream colour apotted with crimath, according to Mrs. Monteiro), the spote very amall within the tube, increasing in size toward the tipl of the lobes, where they are more or lest confuent Oater corona of 5 abort, quadrate, emarginate lobel, deflexed on the batal cuthion of the corolla, parpleo brown with yellowith side margins; inner coroan of 5 simple, lanceolate, acute loben, inflexed over the apez of the anthers, coarcely gibbous behind, dall yellowish, duated with parple-brown. Follides 7 inches long, $\frac{1}{3}$ an inch thick, gradually tapering to a beak, glabrous, streaked with purple on a pall ground; seed. 5 lines long, 3 lines brom, ovate of elliptic-ovate, crowned with a tuft of hairs, fit wit broadly-winged margins, pale brown. Dolagos Bay N. E. Brown.

## 巴SCHYNANTHUS HILDE. <br> BRANDII (see fig. $62, \mathrm{p} .333$ ).

Plants and needs of this new species of Pichyo nanthus were received at Kow in January, 1894 from Mr. H. H. Hildebrand of Fort Stedmath Shan States, Upper Burma, who found it growing a high altitude in the foreste, its ahort atemi formin is dense tufte apon the trunke of trees, to which 13 clings by means of its roote, which creep into thers. crevices of the bark, finding nourishment thert When in flower it had the appearance of compaci

Iutsole tota naperficie interna pustalis crebris purpuresin tio serratis decors: petalis brevibus linearibus suprs bilotismen triquetris carnosis albidis; labello ablougo lipenricuppros. antice minuto serralato ibl incrassata albido minutisim antice minute serralato ibi incrassate albido millit gatenle pareo-a
cuabion of orange-scarlet. The plants at Kew are grown in a cool, moist house, such an suits Mandevallias, and they have been in flower sioce the apring. The longest atems are 9 inches long, but uanally they are only 6 inches or leas, with few whorls of fleahy tomentose leaver near the top, from which apring the flowers in clasters of from two to nix. They are of a rich flame-acarlet coloar, with a margin of crimson. So far as is known, this is the only apecies of Aschynantbus that can be cultivated in a cool-house, all the others, of which there are about fifty known, being tropical. It is a suitable companion for Sarmienta repens, the pretty little Chilian representative of the order, but it is preferable to that plant-rrom a cultivator's point of view,

The Tomato Re Umberto, known in Naple mader the name of Fiascone, and in France as Merveille d'Italip, furniahes the largest quantity of preserve, which, however, is not of so fine a thavour as that made of other kind. It is coltivated in gardens near the town.
The variety known under the name of Fianconcello, corresponding to the Spanish Tomate cirulla, is distinguished by it Plum-thaped deep icarlet fruit. It is a better cropper than the former, its flavour is finer, and its cultivation is conatantly increasing, to the detriment of the other kind, although it gives less preserve in proportion to ite aizs so These are the varietien of Tomaton grown largely under irrigation. There is, however, another kind, very valuable, because it can be grown without watering-

Fig. 60.-microetylis macrichila.
at any rate-it being mach more eanily kept in health. The plant was figured in the Botanical Magazine, t. 7365. W. Watson.

## I T A L Y .

Tomaros. - This year Tomatos have, in the province of Naplet, flowered rather late, owing to unfavourable weather, and at the end of June there wes but e scanty apply of the variety called Sicily, known in England under the name of Early Red Tomato, or Puwell' Early, a variety which hold the firat plecd for ite precocity. The mont important Nespolitan varieties are the common of Naples, or Padula, grown in certain well-watered ground. clone to the town, and mach sppreciated for its flavour and prodactivenens. Thim variety produces large, flenhy, acarlet fruitr, generally of a round ahape, momewhat depressed in the upper part, and crossed by a deep furrow almont to half of the fruit. It is mach made use of for asace and for preserving, $a$ well an for oating in salad when not quite ripe.
for instance, in the Vesurian sandy grounds, where no other herbaceona kind could be grown during sammer. It is the 0 -called "Ciento a achiocca," which is a sab-variety of the pyriform variety, known in Eag* land under the name of Pear-ahaped Tomato. It is cultivated extensively in Torre-del Greco. The plant is nipped at the point when 4 inchen high, it then ramifien, producing almost erect stems, which grow without supprt. It racemes produce from ten to fifty fraits of a pale red, approaching to orange colour; it is pear-shaped, and hee tranaverse diameter of about $\frac{1}{2}$ inch, and ita flavour is aenuibly acid. Thil fruit may be kept a very long time, and oven in Jane clasters of fraite prodaced in the previons October may be neen. The farmers take them off before their perfect maturity, i.e., when the firat frait begin to tarn into red, and faten them with a atring which they unite at the extremitier, giving the whole an appearance of enormous bunches of Grapes, which vary in weight from 12 to 16 lb . If, however, there is wet weather during growth, the frait lone in proportion ita long-keeping property.

The Hobticulturar Show in Naples.
In connection with an exbibicion of birds, there was the other day a plant and flower-thow in Naples. Owing to the ahort notice, the plant exhibited were rather few in number, but cut flowers and floral arrangement were more namerous. Amongst the exhibits, there were some specialties which to English readers may be of intereat. Dr. G. Mottareale, Portici, Augut, 1895.
(To be oantinced.)

## MICROSTYLIS MACROCHILA.

The genue Microstylis is not a favourite one with Orchid-growers, bat that many of the species are possessed of sufficient beaty, both of leaf and flower, was well exemplified in the pretty groap of them staged in the centre of the fine collection of Orchid in lower exhibited by Mesars. F. Sander \& Co., of St. Albans, at the lant Temple Show of the Royal Horticaltural Society. Two of the prettieat were Microstylia Scotti and M. macrochila (dg. 60), both of which had their pale-green and cream-coloured leaven beautifully mottled with light brown. The flowers of M. macrochila are dark parple, and it appears to be very free in growth and bloom if grown in a moist, warm, and tolerably shady house. After the growth have flowered and matured the leaves fade, and from that time until the next growing-season, water should be withheld or very eparingly afforded. It is the neglect of this resting season, and the habit of watering plants all the year round, which has probably caused the ecarcity of Microatylis in collections.

## FLORIST8' FLOWER8.

## THE SHRUBBY PHLOXES.

Messrs Paul \& Sons grow a fine collection of Paloxes in their intereating hardy plant nursery at B-oxbourne, Herts. All the beat named varieties are here, ach as Etna (Lemoine), almon-acarlet, dark eye; Kosautb, chorry-rose, with a purplish tint in the centre; Carillion, rosy-lake, fine form; Eclairreur, parplish-crimaon, with light eye; Emmanuel Herve, clear lilac, large, fine form ; and many other of the newort and beat. At the O.d Nurseries, Caerhat, there is a fiae collection of reedling in flower at the present time. There miy be some difference of opinion as to which of the two collections is the more beautifal. For my part, I dicide for the afedlinge. Nut only do well-grown seedlinga make beautifal show in the garden, but they are mach more interenting. I am not one of those who fancy that the dwarfer you can get plantin the more ahould they be prized; but the varieties of Phlox decusuata of gardens twenty-five jeara ago, were from 1 to $1 \frac{1}{2}$ foos too tall, and in dry seasons the atema becoming devoid of leaver to a great extent, become decidedly unaightly if not masked by other plante. The height of the newer varietien is much reduced, and the seedling now in flower at Cbeshunt are sturdy specimens, averaging $1 \frac{1}{4}$ foot high. Very few of theme seedlings can be selected which are not an good as the nsmed varieties; and the grest variety of colour amonget them is a noteworthy feature. Some with pare white flowern of exquisite form were very fine; other* exhibited parple-lilac, rose and acarlet tinte-and all of them were of good form, very fow indeed harking back to the primitive type.
Some amsteure may any, "It is all very well for you to recommend meedlings, bat how are we to get them?" My reply to this is, save gour own seed from the best named rarieties. The latter can be obtained direct from any good florist, and in a meason like this it is not difficalt to obtain seed; but in order to have anything like saccess in seedling raising, the flowers hould be crose-fertilised by hand, and wome care and judgment exercised in the blending of the colourt. I have found that if the flowers are not crom-fertilised, an immense namber of planta may be grown, and the varietien will be good, but they will vary in colour but little
or not at all from the parentr. The seed ehould be sown on a hot-bed about February 1; it very soon vegerates, and when the plats have grown 1 inch high, prick them out in boxas, and grow them on near the glass in a warm greenbouse. By procesding in thic manaer, sturdy plants may be had ready to plant out io the open borders about the first week in the month of May-a little earlier will be all the better. If they are planted at about 14 inches asunder, each plant will throw ap one strong size in the sutumn. Although the Phlox is clansed with perenniala, the plants may be had finely in flower in seven or eight month from the time of sowing the seeds. The noil for seedling Phloxes, as for named varieties, should be worked to a good depth, and I never knew them to suffer from over-manuring. If the soil is deep and well mauured, the plant are well sustained through the heat and drought of the aummer. The first year there is only one atem flower to each plant; snd if it is intended to flower them a second jear, they should be replanted about 2 feet asunder, on freah deeply worked, and well manured ground.

The ame treatment is necessary for the named varieties, but a good syatem of propagation mut be carried out. It is easy enough to chop an old Phlox plant into pieces with a apede, and plant them eparately, but this clumsy procedure does not give astiafactory resulta. The best spikes are obtained from plants that have been propagated from cattinge in gentle bottom-heat, and the best cuttings are found on old stools when the plants atart to grow in the spring. If taken off with a heel, and inserted singly in small pots, the roots soon form. Early-propagated plants, grown on till they come into 6 -inch pota, produce handsome spikes, and form verg useful stuff for greenhouse deceration. After flowering, tarn them out of the pote into the open ground, as recommended above for seedlinga24 inches anauder. Sach plants produce the fineat flower-spiken the following meason, and three only should be allowed to each plant. J. Douglas.

## ORCHIDSATBUREORD DORKING.

Sir Trevor Lawhenca, Barto, the President of the Royal Horticaitaral Society, is jastly known as one of the most liberal of the amateurn of gardening, who have throughout maintained a tine collection of Orchid, and he is as keen a collector of good and rare Orchid at the present day as he has ever been, although the varied collection which te has eucceeded in getting together rendera it increasingly more difficult to find good thinga already not anfficiently well represented there. As the number of specier, too, increase, the difficulty of keeping in bealth unique plante about which little or nothing can be gleaned to nerve an a gnide to their cuiture has to be met. In this particular, and in mot other mattore relating to Orchid culture, the remarkable auccen attained at Burford, and the aplendid condition in which the plant there now are, give ample proof of the interest taken in them by their owner, and the care and wiill of hia attentive Orchid-grower, Mr. W. H. White.

From time to time wo have given illnatrations of some of the marvellous plant in the Burford collection, and it greatly enhance the pleasure of a visit to look up the apecimens illatrated. Invariably we find them in better condition than ever, and on the present occasion the noble pecimen of Sophronitia grandiflora illustrated in Gard. Chron, April 20, 1895, and the other which we have depicted, were fonnd in splendid condition, and promining a still greater show of bloom in the coming eason. Especially in this the case with the great mase of Cattleya Lawrenceana, exhibited by Sir Trevor Lawrence recently before the Royal Horticultural Suciety, with fiftycight flowern, one of the opike bearing no fewer than thirteen blooms. In the coming neamon it will probably exceed that namber, in the aggregate at least, if not on the aingle inflorencence.
Commencing with the lean-to warm houses in
which the Vanda teres and V. Hookeriana thrive so well, and in which the tall pecimen of Vanda Miss Joaquim (Hookeriana $x$ teres), is thriving and approaching the flowering atage, we found the rich collection of varietie of Lælia anceps throwing up spikes profasely, and the singular Laisia volucris, Lelia Lawrenceana, and the carious greenishwhite Epidendrum Imschootianum in bloom. In the next division, on the front of which the scarlet Habenaria militaris, the allied H. rhodocheila, and the white and piak form of Habenaria carnea, thrive no well, and make much a fine ahow, in bloom were the pretty Burford hybrid, Cypripediam $\times$ pictaratum (Spicerianam $\times$ saperbiens), C. $\times$ Mor. ganise Bariordiense, still the best of its cluss, and one that it is difficult to conceive finer in ita way; C. $\times$ Earyale; various other Cypripediams, and a pretty variety of Cattleya Luddemanniana.
These houses, like the other warm houses at Barford, have all the available pace under the ataging planted with Cyrtodeiras, Fittonias, Pilea, and other pratty compact-growing foliage-plants. Such a method fills ap vacant apacer, is effective, and very favourable for the plants. In one corner of the house, just passing out of bloom, is a large specimen of Coelogyne Camingii.
The next house, a cool intermediate one, bay a fail collection of the large-flowared Maxillarias in excellent condition. M. Hubschii, M. fucata, and a few others being in bloom, as well as Oocidiam incurvum and $O$. i , album. Odontoglossam B:c50niense and O. B. albam, Miltonia Ctowesii and other Miltonias, and some pretty tafts of the orangescarlet Lalia monophylia, which here thrives so well that the planta bear from twenty to thirty or more flowers on each.

In the large intermediate-house, filled principally with a splendid collection of Lselis and Cattleyas, the bank of varieties of Vauda tricolor and V.auavis is in undiminished vigour and beauty. The oplants sorely trouble mots growert, and we wonder how many have completely failed with them during the long time those in the Burford collection have been growing in the most satisfactory manner. In this house is an immense masa of Oacidiun lanceanum, some 4 feet across, and in the mont perfect healch; on the front stage is a larga quantity of hybrid Cattlegas and Lælias, and of equally-prized rare importel kinde, which are being carefally tended until their flowering atage is rached. Among the plants in flower are a fine example of the aingular Coologyne fuliginosa and Cattleya $\times$ Blesensis.
In the large pan tove-house, amid the freshlooking foliage and brightly-coloured spathes of the plants of Aathariam Andreanum and its hybride, are many fine and rare Dendrobiams, among which were in flower D. Lowii, I). cruentum, \&c., and Vanda Hookeriana. Oa one ide is a collection of the handsome-leaved Bertolonias, and in a corner the giant specimen of Grammatophyllum specionnm, which regalarly sends forth its tall, stout pseado-bulba and graceful Palm-like foliage, but an yet has not produced flowern. Some day the reward of patience and akill will come, and the flowering of the plant add another triamph to the many which have been won at Burford.

The large Odontoglossum-house has ite occapants In very fine condition, s noteworthy fact when it is remembered that many of the apecimens have been on the place for a number of years. These plants at one time, although keeping perfectly healthy, did not make the progrese desired antil they were shifted into their prement quarters, and since that time they have increased in vigour and in aizz in a remarkable degree, and another house on tho same plan will probably be built for new.comers. A few O. Peycatorei, O. cristatellum, and a good lot of O. grande, the pretty yellow Oncidiom cristatum, Trichocentram albo-purpaream, and othera also were in flower.

In the next intermediate-houre, the large table in the centre is flled with the apecimens of Sobralias, which a little earlier in the year are one of the sighte of Barford, ten or a dozen different apecies and varietien, each givigg a profusion of bloom at one
and the same time. At present the specier chifly represented are S . macrantha, of which there an some grand plants and varieties; and S. xantholeta, Here in bloom, too, are some large apeciment of Cypripediam $\times$ Ashburtonig, C. $\times$ Crossianam, and other of the older varieties; and in a shagy conep a large specimen of Cypripediam Schlimii, whics seems to flower continually. On one side is a baok of the Burford variety of Cypripediam $\times L_{\text {seana }}$ saperbum; on another, a splendid lot of Miltooia vexillaria, with a few good M. $\times$ Benias, and about the house in flower were $C$, Charlesworthii, C. Spicerianum, Vanda cerale, a plant of a very large form of Stenia pallida, and another of the pretty fringed-lipped Chondrorhyacha Chestertonii ; two fine plants, one with four apike, each 1 s inches loug, of the rare and pretty Epidet. dram eceptram; several of the true Cypripetion purpuratum; Oacidiam aurosum, O. cheirophom, O. cornigerum, Pholidota obovata, sud ame other angular botanical species. The rare Heliamphom nutans is also thriving here. In the adjoining how are some good Miltonia Ropzli in bloom, Oncidinm Jonesianam, Lælio-Cattley a $\times$ elegana, Li $\times$ Amandh the pretty Aganisia ionoptera, Epidendram ottoin, E. Gideffizaam, \&c.

Tae large pan-roofed warm-house, in which the Phalæopais occupy the staging on one side, in atmyn interesting from the flcor to the roof, for undernewt the staging, and in front of the hotwater-pipes Eacharia grandifora is planted, and it grows in : marvellous manner and produces a great quantity of its large pure white flowers; while the roof is thickly set wich hanging-baskets of Cirrhopetalums, Balbophyllums, Catabetums, \&c., which are here in gremer variety than in any other collection, and they an constantly producing their quaint flowers, ranging from the immense hooded Bulbophyllum grandifloram (illustrated in the Gardeners' Chronicle from the unique specimen at Barford, April 6, p. 429), to the lithle Cirrbopetalom (Yamingii, with its prolaion of flowere arranged like tiny pink parasols. Th coppery-orange Cirrhopetalum Masterianum, and a few other carious botanical apecies are in flower; and among the Catanetums, a great mam of the pretty green and white C. Rastelianam, which in the atructure of its pretty flowers seems to atand alowe in the genus. At the end of the hown is a number of apecimens of marvellously pretty Anæctochili, and in bloom are Paslænopnis violacen, P. Esmeralda Regnieriana, a number of rare hybrid Cipripediams, and a good show of varieties of Dano drobiam Phalæaopais Schroderians. Oa one side the Burford hy brid Calanthenare making up immen balbs, and on the pots of some of them, seedling of a new race are coming up in great profuion. In the adjoining sanay lobby the hybrid, decidnous 1) androbiams are ripening the fine growths they have made, and some quite new crosees are expected to flower next year.

In the Aërides-house the epecimen of Oyvirsudn fenestralis (Lattice plant), always an objch of interest, is atill in fine condition; and in flower are Stauropsi philippinensis, a real gem, with slender stem, ciad with distichons leaven, from the bere of each of which proceed a pretty red-brown flowef, with a yellow margin, and with curiously-ridged lilec lip, the whole plant forming a pretty pray of fowest wich foliage. Oncidiam Kramerianum, Aëridea Laro reacim, Dindrobiam bracteonam albam, Polyotachan odorata, and other fine thinge are also in bloom; gnd in the Madavallia-house many Masderallias, Plearsothallis, \&a, chielly of botanics! interent, are still flowering-while the now seedling-house seems to contaia material for novelties for many geara yot
come. come.
Ia the general garden, so ably tended by Mr, W. Bain, the show in the greenhouses and stovell is wrilo worthy of the Orchid department; indeed, the liant effect, the splendid taberous Bugoniss, premin Soreptocarpus, and fragrant Lilies, make in miagled servatory whose roof is laden with the mimg of flowars of the white and tha crimson varie
Lapageria rowa, woald be diffisult to excelo
the beds of brilliant Cannat ; of gracefal and bright Montbretias; fragrant and richly-coloured Roses, Gladioli, Crinum Powelli (which is here one of the finest baráy balba), and other flowers being all that could be desired, while here and there peep forth novelties or well-known old plants never seen in auch beantifal form before. Two remarkable in atances of the latter are the pretty bushes of sky blas Tweedia ceroulea, which by catting back are here cauned to make neat and charming planta; and the parple Raodochiton volabile, which rans over a rantic arch.

## CHRYSANTHEMUM MAXIMUM AND ITS ALLIES.

Tre receipt of a letter and apecimen from Rev C. Wolley Dod induced as to examine the her bsrium apecimens, and those in cultivation at Kew and Caiswick
Chrysanthemum pallens, J. Gay (1833), ex Indice Kevensi, i., 527.-Bracts of the involucre with a deep white or pale brown margin; corolla of discflorete gibbora, or apurred at the bave.
C. maximons, liamond (1R00), ex Indice Kewensi i 525. - Bracts of the involucre with a brown margin; corolla of diac-iforets not gibboas or sparred at the bsae. The aasociation of tushy learea and a more or less cosreely hairy epiderm in anasual.
C. pallens is ueually the maller plant, 2 to 3 feet, the leaves lighter-coloared, less hairy, and leas leaby than thone of maximum. C. maximum is a rather more robast plant, with darker - coloured, larger leaves, and involucral bracta, and without any apar or protrusion at the bave of the corolla of the dincfloretp, ach ss characterines the disc floreta of C . pallen.
Ia addition, there are C. Lactstre, a coarne growing, tall perennial, 4 to 5 feet bigh, with thick, fleahy, quite glabrous, gloney leaves, and large white flower-hesds. The ray-flortts of this apecies have a rather deep, laciniate, membranous cap, armounting the ovary. No such pappus or cup exists in the florets of the difc. The involucral scales are orate-oblong acate, with a deep membranous border, extending from the tip to abous the middle of the acale. To thi belong cortain garden form called latifolium and grandiforam ; and here belongs in our opinion the larger of the two plants called maximam by Mr. Wolley $D, d$ in the commanication, and of whica he bas kindiy transmitted specimens. This it atill in bloom, whilst C, maximam and C. pallen are both over.
C. sraotinum is also a tall-growing perennial, 4 to 5 feet, not yet in bloom. Its upper leaves are senaile, lanceolate, coartely serrate from above the middle to the tip, dall green, slightly pilose, especially apon the lower sarface, and often with a pair of mall loben or teeth at the very base. The involucral icales in the young atate are covered with white hairs.
C. atalum has leaver auricled at the baee, and the invulacral leaves almoat black at the tip. This is perhapa only a form of C . leacnathemam.
"C. pallens.-Laat apring I received from Mr. Marahall, chairmnn of the floral committee of the Royal Horticaltaral Society, a plant named Chryanathemum pallens; he acked me whether I knew it as a ditinct apecies from C. maximum. When the plant flowered I found it to be what I have grown for many years as the type of C. maximum (Ramond), but on careful examination of the characters, with the help of a botanical expert, I find it to be C. pallens (Gay). In common with moat amateara I have generally considered that there were two forms of C. maximum (Ramond), one of slender habit, growing at mowt about 2 feet high; the other coaraer and with thicker leaves and larger flowers, renching, on rich soils, a height of 4 feet. Both of these are diatinct from the atill taller and larger C. latifoliam ayn. C. lacastre. The emalier of thene two plante will be found on examination to be C, pallens (Gay),
and the larger C. maximum (Ramond). The botanical distinctions between the two are not obvione, except the difference in size; bat the name "pallens" is derived from the colour of the bracte of the involucrum. If a flower ia turned aptide down, the general colour of the edges of the bract is nearly straw-coloured in C. pallent, whilat in C. maximum it it darl brown. The lower part of the stalk in C. pallens is hairy, whilat that of C. maximam is smooth. There are alto differences in the pappus and the achene only to be observed by minate eramination. The native range of C. pallens is more extensive that that of C . meximuma and it is less of a mountain plant, reaching from Portagal through moathern France and nortbern Italy, nearly to the Black Sea. It in known that C . maximum in varisble from seed, and where these two closely

allied pecies are grown near one another, it will probably be found that they amalgamate, and produce intermediate forme, but as botaniats have recognized them as distinct, it is better that they should have their right names given to them in gardens. C. Wolley Dod."

## a FICUS STRANGLING A MANGO TREE.

Ofr illuatration, taken from a photograph kindly farnished by Mr. G. M. Woodson, College of Science, Poonah, exhibita a Mango tree growing in a grove near Lanowlee, on the Weatern Ghante, India, being killed in the embraces of a Ficas. The process of dentraction is well and correctly detecribed is the following worde by Mr. James Rodway in the Gwiana Forest:-
"Woe betide the forest giant when he falle into the clatches of the Clusia or Fig. Its reeds being
provided with a pulp, which is very pleasant to the taste of a great number of birda, are carried from tree to tree, and deposited on the branches. Here it germinatee, the leafy atem rising apward, and the roots flowing, as it were, down the trank antil they reach the soil. At firat these sobial roota are moft and delicate, with apparently no more power for evil than so many small atreams of pitch, whica they resemble in their slowly-flowing motion downward. Here and there they branch, eopecielly it an obatruction is met with, when the stream either changes its course or divides to rikht and iefis. Meanwhite leaty branchea have been developed, which push themaelves through the canopy above, and get into the light, where their growth is enormoasly accelerated. As this thkes place sthe roota have generally reached the ground, and began to draw saatenmoce from below. to atrengthen the whole plant. Then comes a wonderial development. The hitherto toft aerrial roote begin to barden and spread wider and wider, throwing out side-brancnes which flow into and amalgamate with each other which thow into and amsigamate with each other until the whole tree-trank is bound in an meries of
irregular living hoops. The strangler is now ready for its deadly work. The forest gisnt, lise all exogens, mutt have room to increase in girth, and here he is bound by cords which aro stronger than iron bands. Like an athlete, he tries to expand and burat his fetters, and if they were rigid he nuight succeed.

The bark bulge between eyery interlacing-bulgen out, and even tries to overlap; bat the monster has taken every precaution againat this by making ita banda very numerous and wide.

As the tree becomes weaker its leaves begin to fall, and this gives more room for its foe. Soon the strangler expands itself into a great bueh almost as large as the mass of branches and folinge it has tffaced. . . . . It we look carefully around us we ree examples of entire obliteration-a Clasia, or Fig, atanding on ita reticulated hollow pillar, with only a heap of brown humus at its base to show what has become of the trank which once atood up in all ita majesty on that apot."

## LATE STRAWBERRIES

As we experience nuch varying seazons, this one very hot, the next wet and cold, the importance of growing both early and late varietien of Strawberriea on different aspecta is obvious. This year our late plants on north borders were an eapecially welcome addition to the aupply, ws the outside crop was over earlier than uzual. Lats seaton, owing to late spring frout during May, much of the bloom of the midseason varieties was injured by frost, and in the southern parta of the country the earliest plants had fruit halt grown which was deatroyed, whereas the bloom on north bordert wae less advanced, and remained uninjared.
August is a good month to plant for late suppliey, and I ventare to assert that the fruite will be much appreciated, as we never appear to bare too long a season or too abondant a crop of Scrainborrié Late year I find that our aupply latted aix weelo, thanks to our late kinds; thin year wo gathered much earlier and the period was a little over five weeks. Of late varieties there is a large choice, and the first place I would give to British Qaeen, a variety that does not do well everywhere, but is well worth growing if it thrives-it juat follows on the main crop varieties. Eleanor or Oxonian in also a largefraited late variety, not noted for flavour, but a free grower and truatworthy cropper. Aberdeen Favoarite is superior, though a little smaller; a fine type, of briak flavour, and very late when grown in the shade of a north wall. For some seasona Jabilee uned to be grown here in the ame aspect for its good qualities and lateness, but it has now made way for Latest of All, a mach superior variety, with the British Queen flavour, and coming beat in dry hot eeasons. It is a very fine fruit, and an immenso cropper, requiring frequent rewewale if grent aise in the fruit is required. I am unable to recommend Waterloo, as it does not crop freely at Syov, owing. I think, to the nature of the soil; and young plante, unlens planted very early, eeldom fruit freely. The "Pine" section of Strawberries conaista montly of late varieties, such as E ton Pine and F .bert Pine; but if mv choice was limited to two unly. I shoald select British Qieen and Lateat of All, planting them iu the mouth of Jaly for fraiting the next searon. In good land these two varietiea will zacceed admirably, giving fine large fruite afier the planta in open bedr have ceased to bear, $G$. Wythes.

## BOTANICAL SECTION OF THE <br> BRITISA ASSOCIATION.* <br> (Concluded trom p. 297.)

Oqganisation of Section.-I am afraid I bave detained you too long over these matters, on which I must admit I have apoken with some frankneas. Bat I take it that one of the objects of our section is to deliver our minde of any perilous staff that is fermenting in it. Bat now, having taken leave of the past, let as tarn to the fature.
We atart at least with a clean alate. We cannot bind our saccensora, it is true, at other meetings. Bat I cannot doabt that it will be in our power to materially shape our futare, notwithstanding. When we were only a department I think we all felt the advantage of these annual meetings, of the profitable ducuanion formal and informal, and of the privilege of meeting so many of our foreign brethren who have so generounly supported ue by their presence and aympathy.
I am anxious, then, to nuggent that we should conduct our proceedings on as broad line: as pomible. I do not think we should bo too ready to encourage papers which may well be communicated to societies, either local or central.

The field is large ; the labourers at they advance in life can hardly expect to keep pace with all that in going on in it. We mast look to individual members of our namber to help us by informing and stimulating addresses on anbjecte they have made peculiarly their own, or on important researches on which they have been eapecially engaged.

Nombnclature.
There in one aubject upon which, from my official position elcewhere, I denire to take the opportanity. of anying a few words. It is that of nomenclature It in not on ita technical side, $I$ am afraid, of anfficient general interent to jautify my devoting to it the space which ita importance would otherwise deserve. Bat I hope to be able to enliat your aupport for the broad common-senve principles on which our practics should rest.

A! I suppose, everyone knows we owe our present method of nomenclature in natural hiatory to Linnacus. He devised the binominal, or, as it is often absurdly called, the binomial system. That we must have a technical aytem of nomenclature I appose no one here will diapate. It is not, however, alway admitted by popalar writers who have not appreciated the difficulty of the matter, and who think all names should be in the vernacular. There is the obvious difficulty that the vast majority of planta do not poseess any names at all, and the attempta to manufacture them in a popular shape have met with but little auccem. Then, from lack of discriminating power on the part of those who use them, vernacular namen are often ambiguous; thas Balrash is applied equally to Typha and to Scirpas, planta extremely different. Vernacular namen, again, are only of local utility, while the Linnean syatem is intelligible throughout the world.

A technical name, then, for a plant or animal is a necenity, at withont it we cannot fix the object of our inveatigations into ite affinity, atructure, or propertien $\dagger$ Nomina si nescis perit et cognitio rerums.
In order to get clear ideat on the matter, let as look at the logical principlem on which auch names aro based. It is fortunate for ut that these are atated by Mill, who, beaides being an authority on logic, whe also an accomplished botaniat. Ho toll. us: " "A naturalist, for parposen connected with his partivalar science, sees reason to distribute the animal or vegetable creation into certain group rather than into any others, and he requires a name to bind, 2 it were, each of his group together." He further explains that auch names, whether of apecien, genera, or orderm, are what logician call connotative : they denote the members of each group, and connote the diatinctive charactert by which it is lefined. A apecies, then, connote the common charscters of the individuals belonging to it; a

[^28]genus, those of the pecies ; an order, those of the genera.

Bat these are the logical principlet, which are applicable to names generally. A name ach as $R$ inunculus repens does not diffor in any particular from a name auch as John Smith, except that one denotes a specien, the other an individual.

This being the case, and technical names being a necessity, they continually pass into general ase in connection with horticulture, commerce, medicine, and the arts. It seems obvious that, if acience is to keep in toach with haman affairs, atability in nomenclature is a thing not merely to aim at but to respect. Changes become necessary, but should never be inaiated on without grave and aolid reason. In some cases they are inevitable anles: the taxonomic side of botany is to remain at a atandatill. From time to time the revision of a large group has to be undertaken from a uniform and comparative point of view. It then often occurs that new genera are seen to have been too hastily founded on inanficient grounds, and must therefore be merged in others. This may involve the creation of a large number of new namen, the old ones becoming henceforth a burden to literature as synonyms. It is uacul in unch cases to retain the specific portion of the original name, if posible. If it is, however, already pre-occapied in the genus to which the transference is made, a new one must be devised. Many modern satematists have, however, set up the doctrine that a specific epithet once given is indelible, and whatever the taxonomic wandering of the organiam to which it was once anaigned, it must alway accompany it. This, however, would not have met with much eympathy from Linnæus, who attached no importance to the apecific epithet at all: Nomen specificum sine generico est quasi pistillum sine campana.* Linnæus alwaya had a solid reason for everything he did or asid, and it is worth while conaidering in this case what it was.

Before his time, the practice of asociating plants in genera had made aome progren in the hand of Tournefort and otherm, bat specific name were still cumbrous and practically nuasable. Genera were often distingaished by a single word; and it was the great reform accomplished by Linneas to adopt the binominal principle for pecies. But there in this difference. Generic names are anique, and must not be applied to more than one diatinct group. Specific name might have been constituted on the ame basis; the pecific name in that case would then have never been used to deaignate more than one plant, and would have been anfficient to indicate it. We ahould have lost, it is true, the useful informstion which we get from our prevent practice in learning the genus to which the specien belongs; bat, theoretically, a nomenclature could have been eatabliahed on the one-name principle. The thing, however, is imposaible now, even if it were deairable. A pecific epithet like vulgaris may belong to hundrede of different apecier belonging to an many different geners, and taken alone in manainglesa. A Lianean name, then, though it consiat of two parta, must be treated an whole. Nomen omne plantarum constabit nomine generico et specifico $\dagger$ A fragment can have no vitality of its own. Consequently, if superseded, it may be replaced by another which may be perfectly independent. $\ddagger$
It conatantly happens that the atme apecien is named and described by more than one writer, or different viewi are taken of apecific difforencen by varions Writers; the apecies of one are therefore "lumped" by another. In such casen, where there is a choice of names, it is cuntomary to eelect the earliest pablithed. I agree, however, with the late Sareno Watson \& that "there is nothing whatever

* Phil., 219.

## Phil., 212.

I As Alphonse de Candolle points out in a letter published in the Bull. de la Soc. Bo:。 de France (IXxix.), "the real merit of Linnexu has been to combine, for all plants, the generic name with the apecific epithet." It is important to remember that in a logical sense the "name" of a species consists, as Linneus himself insisted, in the combination, not in the specific epithet, which is a mere frogment of the name, and meaningless when taken by itserl.

6 Nature, Ilvii, 54
of an ethical character inherent in a name, throggl sny priority of pablication or position, which thould render it morally obligatory upon anyone to accept one rame rather than another." And in point of fact, Linnæus and the early jatematists attached little importance to priority. The rigid application of the principle involves the assumption that all persons who describe or attempt to describe plant are equally competent to the taik. Bat thin ir a far from being the case that it is sometimes all bat inpostible even to guess what coald poxibly han been meant.*

In 1872 Sir Joseph Hookes t wrote:-"The nathes of species described by author who cannot deter mine their affinities increases annually, and I regard the naturalist who pate a dencribed plant into if proper position in regard to its allies as renderng a greater service to acience than its describer min he either pate it into a wrong place, or thon if into any of those chaotic heaps, miscalled guma, with which ayatematic works till abound, This has alway seemed to me not merely tound man, but a scientific way of treating the matter, Whas we want in nomenclature is the maximum amoms of stability, and the minimum amount of change compatible with progress in perfecting oar taxonomie syatem. Nomenclaturs is a meang, not an ond There are perhaps 150,000 apecies of flowering plantain existence. What we want to do is to puah on the tuk of getting them named and deacribed in an intelligith manner, and their affinitie determined as corretly as poasible. We shall then have material for dealing with the larger problems which the vegetation of our globe will present when treated as a whole. To me the botanists who waste their time over prioits are like boya who, when ent on an errand, apend their time in playing by the roadside. By arch man even Linneas is not to be sllowed to decide his on names. To one of the mont eplendid ornamentr of our gardens he gave the name of Magnolia gracliflora: this is now to be known as Magnolia fertid The reformer himself is conatrained to admit, "The change is a most unfortanate one in every war? It is difficult to nee what is gained by making it except to render ayatematic botany ridiculoun. Tan genas Aspidium, known to every Forn caltiration, was founded by Swartz. It now contains tome 400 pecier, of which the vast majority were, of course, unknown to him at the time; yet the namet of all these are to be changed, because Adanoon founded a genus, Dryopteris, which seems to be the same thing as Aspidiam. What, it may be anked, in gained by the change? To cience it it certaill? nothing. On the other hand, we lumber our book with a mase of aynonym, and perplex evergone who takes an interest in Ferns. It appears that the name of the well-known Australian genas, Bankin really belongs to Pimelea ; the ppecies are therefore to be renamed, and Bantaia is to ba rechrintent Sirmuellera, after Sir Ferdinand von Mueller; ${ }^{\text {i }}$ proposal which, I need hardly aty, did not emanto from an Englishman.

I will not multiply inetancer. Bat the wort of it is, that those who have carefully studied the abljots know that, from various causew, which I caniof afford the time to discuss, when once it is attemptod to diaturb accepted nomenclatare, it in almont ins. posaible to reach finality. Many genera only exill by virtue of their re-definition in modern timet; the form in which they were originally promulgate they have hardly any intelligible meaning as all.
It can hardly be doubted that one canee of the want of attention which apatematic botany noll receives is the repalsive labour of the bibliographics worl with which it has been overlaid. What enormous balk nomenclature has already attain may bo judged from the Index Keconsi, which wil

* Darwin, who always seems to me, almost instinctively, take the right view in matters relating to natural history, of (Life, rol. i., p. 384) dead against the new (Life, rol. 1., p. 381) dead against the name of the fry naturalists appending for perpetuity the pam oriority ense: describer to species." Ho is equally against the prioulbout -"I cannot yet brin

1 Flora of British India, i.. will.
Garden and Forest, ii., 615.
prepared at Kew, and which we owe to the munificence of Mr. Darwin. In his own atudies he constantly came on the track of name which he was anable to ran down to their source. This the Index enables to be done. It is based, in fact, on a manacript index which we compiled for our own use at Kew. But it is a mistake to suppone that it is anything raore than the name signifiep, or that it expresses any opinion as to the validity of the names themelves. That thone who nas the book mant judge of for themelve:. We have indexed existing names, but we have not added to the burden by making any new one for apecies already dencribed.

What synonjmy han now come to may be jadged by an example supplied me by my friend Mr. C. B. Clarke. For a single species of Fimbristylis he find 135 published names ander aix genera. If we go on in this way, we hall have to invent a new Linnæus, wipe out the past, and begin all over again.

Although I have brought the matter before the Section, it is not one in which this, or indeed any collective anembly of botaniats, can do very much. While I hope I shall carry jour assent with the generad principlen I have laid down, it mat be admitted that the technical detail can only be appreciated by experienced opecialints. All that can be hoped is a general agreement amonget the staff of the principal inatitutions in different countries where aytematic botany is worked at; the free-lances mut be left to do as they like.

## Publications.

I have dwelt at auch length on certain aspects of my abject that perhaps, without great injustice, you may retort on me the complaint of one-sidedness. But when I survey the larger field of botany in this country, the prompect seems to me 0 vast that I should deapair even if I had my whole address at my disposel of doing it justice. I think that it extent is measured by the way in which the pablications belonging to our aubject are maintained. First of all, we have access to the Royal Society, a privilege of which I hope we shall always continue to take advantage for communication which either treat f fundamental subjecte, or at leat are of general intereat to biologists. Next to this we have our ancient Linnean Society, with a branch of it publication handsomely and efficiently devoted to syatematic work. Then we have the Annals of Botamy, which has now, I think, established ite position, and which bringe together the chief morphological and phyaiological work accompliabed in the country. Lattly, we have the Journal of Botany, a less ambitious but useful periodical, which is mainly devoted to the laboary of Britich botanista. I remember there was a time when I thought that thic, at any rate, was an exhausted field. But it is not so; knowledge in ite most limited aspect is inexhaustible if the labourer have the necessary insight. The discoveries of Mr. Arthur Bennett amongat the potamogetons of the Eastern Counties is a atriking and brilliant instance.

Besides the publication of the Annals, we owe to the Oxford Press a splendid series of the best foreign text-book issued in our own language. If the thought has sometimes occurred to one's mind that we were borrowers too freely from our indefatigable neighbours, $I$, at least, remember that the late Profesmor Eichler paid un the compliment of anying that he preferred to read one of these monumental books in the English tranalation rather than in the original. I believe it in no secret that botany owen the aid that Oxford has rendered it in these and other matter in great meanure to my old friend, the Master of Pembroke College, than whom, I believe, science has no more devoted supporter.

## Palmobotany,

I have asid mach of recent botany; I muat not paas over that of past ages. Two notable workers in this field have pansed away since our last meeting. Saporta wae with us at Manchester, and we shall not readily forget his personal charm. If some of his work has about it a too imaginative character, the patience and eatire mincerity with which he traced
the origin of the existing form of vegetation in Southern Earope to their ancestor in the not diatant geological past will always deserve attentive atudy. But in the venerable, yet alwaya youthful, Williamcon we lose a figure whose memory we hall long preserve. With rare instinct he accumulated a wealth of material illustrative of the regetation of the Carboniferons epoch, which, I uppose, ie anique in the world. And this was prepared for examinstion with incomparable patience either by his own hands or under his own eyes. He illustrated it with absolute fidelity. And if he did not in describing it always use language with which we could agree, nothing could ruffle either his impertarbable good nature or the noble simplicity of his character. Trath to tell, we were often in friendly warfare with him. Bat I rejoice to think that before his peaceful end came he had patiently reconaidered and abandoned all that we regarded as his heresies, but which were, in trath, only the old manner of looking at things. And I think that if anything could have contributed to make hie departure happy, it was the conviction that the completion of hie work and his cientific reputation would remain perfectly secure in the hande of Dr. Scott.

## Vegetable Physiology.

Tarning again to the present, the difficulty is to limit the choice of topice on which I would willingly dwell. In an addrens which I delivered at the Bath meeting in 1888, I ventured to point out the important part which the action of enzymes would be found to play in plant metabolism. My expectations have been more than realised by the admirable work of Professor Green on the one hand, and of Mr. Horace Brown on the other. The wildeat imagination could not have foreseen the developmente which, in the hands of animal phyaiologiste, would apring from the study of the fermentative change produced by yeast and bacteria. These, it seems to me, bid fair to revolutionise our whole conceptions of disesse. The reciprocal action of fermenta, developed in mo edmirable a manner by Marahall Ward in the case of the Ginger-beer platat, is dentined, I am convinced, to an expanaion acarcely lesa important.
But, perhape, the mont noteworthy featare in recent work is the disposition to reopen in every direction fandamental quentions. And here, I think, we may take a useful lemon from the practice of the older Sections, and adopt the plan of entrasting the investigation of apecial problems to mall committeet, or to individuals who are willing to undertake the labour of reporting apon apecial questions which they have made pecaliarly their 0 Fn . There reports would be printed in extenso, and are capable of rendering invaluable service by making accesible acquired knowledge which conld not be got at in any other way.

We owe to Mr. Blackman a masterly demonatration of the fact, long believed, but never, perhapn, properly proved, that the auface of plants is ordinarily impermeable to gases. Mr. Dixon hat brought forward some new views about water-movement in plants, which I confess I found less instruc. tive than many of my brother botanists. They are expressed in language of extreme technicality; but, as far al I underatand them, they amount to this. The water moving in the plant is contained in capillary channele; si it evaporates at the surface of the leaves a tensile strain is net up, se long at the column are not broken, to rentore the original level. I can underatand that in thin way the "transpiration current" may ba maintained. But what I want to know is, how this explains the phenomena in the Sugar Maple, a ningle tree of which will jield, I believe, 20 to 30 gallons of flaid before a aingle leaf is expanded.

We owe to Mesars. Darwin and Acton the supply of a Manual of Practical Veqetable Phyviolagy, the want of which has long been keenly felt. Like the father of one of the authors, "I love to exalt plants" ( i .98 ). I have long been antiafied that the fects of vegetable phyaiology are capable of being widely taught, and are not less aignicat and infinitely
more convenient than most of thow which can be eavily demonatrated on the animal side. How little any accarate knowledge of the subject has extended wae contpicuoasly demonstrated in a recent discusaion at the Royal Society, when two of our foremont chemiat roundly denied the exiatence of a function of respiration in plante, becanse it was unknown to Liebig!

## Assimilation.

The greatent and most fondamental problem of all is that of assimilation. The very existence of life upon the earth ultimately depend upon it. The veil is slowly, bat I think aurely, being lifted from its secrets. We now know that starch, if its firat viaible product, is not ite firat reault. We are pretty well agreed that this is what I have called a "protocarbohydrate." How is the syntheain of this effected? Mr. Acton, whose untimely end wo cannot but deeply deplore, made nome remarkable researches, which were commanicated to the Royal Society in 1889, on the extent to which plants could take advantage of organic compound made, to to apeak, ready to their hand. Loew, in a remarkable paper, which will perhape attract less attention than it dewerves from being pablished in Japan,* han from the atudy of the nutrition of bacteria, arrived at some general conclusions in the same direction. Bokorny appeara recently to have similarly experimented on Algm. Neither writer, however, aeems to have been acquainted with Acton's work. The general conclanion which I draw from Loew is to atrengthen the belief thas form-aldehyde is actually one of the firat steps of orgnaic syntheais, sa long ago aggented by Adolph Baejer. Planta, then, will avail themselves of ready-made organic compound which will yield them this body. That a sugar can be constructed from it has long been known, and Bokorny has shown that this can be atilised by plantm in the production of starch.
The precise mode of the formation of form-aldebyde in the process of assimilation is a matter of dispute. But it is quite clear that either the carbon dioxide or the water, which are the materiale from which it is formed, mutt auffer disuociation. And this require asuply of energy to accomplish it. Warington has drawn attention to the atriking fact that in the cave of the nitrifying bacterium, assimilation may go on without the intervention of chlorophyll, the energy being uupplied by the oxidation of ammonia. This bring us down to the fact, which has long been auspected, that protoplasm is at the bottom of the whole basiness, and that chlorophyll only plays aome aubsidiary and indirect part, perhapi, as Adolph Bieyer long ago anggented, of temporarily fixing carbon oxide like hemoglobin, and so facilitating the diveociation.

Chlorophyll itself is still the subject of the careful study by Dr. Schanck, originally commenced by him some years ago at Kew. This will, I hope, give ua eventusily an accurate insight into the chemical constitution of this important substance.

The step in plant metabolism which follow the syntheais of the proto-carbohydrate are still obscure. Brown and Morris have arrived st the urexpected conclusion that "Cane-sugar is the first sugar to be synthenised by the asnimilatory procenses." I made nome remark upon this at the time, + which I may be permitted to reproduce hert.
"The point of view arrived at by botanieta was briefly stated by Sache in the cave of the Sugar-Beet, starch in the leaf, glacoss in the petiole, canc-augar in the root. The facte in the Sagar-cane wem to be etrictly comparable $\ddagger$ Cano-augar tho botaniat looks on, therefore, as a 'reserve material.' We may eall 'glacose' the augar "carrency' of the plant, caneaugar its 'banking reserve.'
"The immediate remult of the disetstic transformation of starch is not glacose, bat maltove. But Mr. Horace Brown hat ahown in his remartable experiments on feeding Barley embryon that, while they can readily convert maltose into cane-sugar, they altogether fail to do this with glacose. We may

Bull. College of Agric. Inp. Univ. Tokio, vol. it.
Jourm. Chem. Soc., 1893, 673.
Kew Bulletin, 1891, 35-41.
conclude, therefore, that glucose is, from the point of view of vegetable nutrition, a somewhat inert body. On the other hand, evidence is apparently wanting that maltore plays the part in vegetable metaboliom that might be expeeted of it. Its converrion into glucoose may be perhaps accounted for by the con--tant preesence in plant turanes of vegetable acids. Bat, so lar, the change woald seem to be positively
 rense, will prove to have a not very exact chemical connotation.

That the connection between cane-sugar and starch is intimate is a conclusion to which both the chemical and the botaniczl evidence seems to point. And on botanical gronnde this wonld seem to be equally trae of its connection with cellalone.
"It mast be confened that the conclusion that ' cane-sugar' 'is the firat sugar to be aynthetised by the asimilatory procenes seeme hard to reconcile with its probable high chemical complexity, and with the fact that, botanically, it seeme to atand at the end and not at the beginning of the series of metabolic change."

## Protoplasmic Chemistar.

The aynthesis of proteides is the problem which is second only in importance to that of carbohydrstes. Loew's views of this deserve attentive stady. Asparagin, as has long been anapected, plays an important part. It has, he saye, two soarces in the plant. "It may either be formed directly from glacoss, ammonia (or nitrstes) and sulphates, or it may be a transitory product between protein-decomposition and reconotruction from the fragmente."*
In the remarks I made to the Chemical Society I ventured to express my conviction that the chemical proceseen which took place under the influence of protoplaem were probably of a different kind from thoote with which the chemint is ordinarily occupied. The plant produces a profation of sabetancer, apparentily with great facility, which the chemist can only baild up in the most circaitous way. As Victor Meyer $\dagger$ has remarked: "In order to isolate an organic sabatance, we are generally confined to the parely accidental propertien of cryatallieation and volatilisation." In other worda, the chemut only deals with bodies of great molecalar stability; while it cannot be doubted that those which play a part in the processes of life are the very opposite in every reapect. I am convinced that if the chemist is to help in the field of protoplamic activity, he will have to tranacend his present limitations, and be prepared to admit that a there may be more than oṇe algebra, there may be more than one chemiatry. I'am glad to see that a momewhat similar idea has been sugqeated by other fields of inquiry. Profestor Meldols $\ddagger$ thinke that the invertigation of photochemical proceneen "may lead to the recognition of a, new order of chemieal sttraction, or of the old chemical attraction in a different degree." I am delighted to see that the ideas which were floating, I confess, in a very nebolous form in my brain are beitag elothed with greator precision by Loew.

In the paper which I have already quoted, he naye of proteida of:-"They are exceedingly labile compounde that can be emaly converted into relatively stable ones. A great lability is the indispensable ard aecesuary foundation for the prodaction of the various actions of the living protoplasm, for the mode of motions that move the life-machinery. There is a source of motion in the labil position of atoms in molecule, a wurce that has hitherto not been taken into consideration either by cheminte or by pryaicists."
-Bat I matt any no more. The probleme to which I might invite attention on an occasion like this are endless. I have not even attempted to do jutice to the work that has been accomplished amongat ourwives, full of interent and noveligy an it is. Bat I wess afford on angury, that if capacity and earnentnes afford on angury of succens, the prospect of the future of our Section posmen every element of
procone. procine.

## KEW NOTES

Tacca palmata. -This is a new addition to the eultivated speciea of Tacca, reed of it haping been recaived at Kew last year from the Java Botanic Garden, from which a batch of planta were raised, and most of them arenowflowering in the tropical houses. The general characters of the plant are similar to those of the well-known T. artocarpifolia from the Mascarene Islands, but amaller, the slender leaf-atalks being 1 foot long, apporting a palmatifid blade 9 inches across; the flower-acape is erect, from 18 inches to 2 feet in height, and it bears an umbel of about twenty dall parple flowers apringing from a quartette of leaf-like, green bracts. The flower, which are $\frac{1}{2}$ inch in diameter, have three inner and three outer recarved segments. The plant is worth a place among interesting easily-grown tove plant. Probably it will grow to a larger ize. T. pinnatifida, from the roote of which arrowroot is prepared in Fiji, bas also lately flowered at Kew. A fourth species grown here is T. cristata, generally known as Ataccia.

## Crinum purpubascens

Sir John Kirk. K C.B, recently brought to Kew weedlinge of a Crinum which he found growing in deep water at Brass near the mouth of the river Niger, and which, wo far as he could see, wan a true aquatic, the leaves an well as the stem being qnite submerged, the head of Anwers only appesring above the surface of the water. In the diatanca the flowers had the appearance of a Nymphæa. On pulling at one of the flowerheads he drew up with it a long Leak-like stem with narrow strap-shaped lesves more like some rea-weed in character than any Crinum. Sir Tnhn, on seeing a plant of C. purpurascens in the Kew collection, which is a native of that region, thought it might probably be the ame as what he saw at Brase. The inference is that C. purpurancens is of aquatic babitw, and jadging by Sir John'a dencription, it is a much moreattractive plant when seen growinc in deep water than when growing in a pot in the ordinary way. It flowers annually in a atove at Kew.

## Agave Kibwensis.

For many yeare there has been a gigantic Agave in the acculent-house at Kew under this name. Its early history appears to be unknown, but thirty years ago it was included by Jacobi in his Monograph, where it was first described under its present name. At that time it was a large plant. oo that probably ite age now in fifty to sixty years. It is now flowering for the first time, the pole-like spike reaching to the roof of the house, and bearing a dense head of large bright yellow finwers. A figure of it has been prepared for the Botanical Magazine, where, no doubt, Mr. Baker will tell all that there it to be told with regard to it . Meanwhile it is worth the while of anyone interested in Agaves to see this plant, which is exceedingly handsome in flower, bat which doen not at present look like perpetasting itself, the leaven having all perished, and the atem failed to develop vuckert. Posibly, however, bulbila will be produced on the inflorencence.

## Cbrbus gigantrus.

One of the large specimens of this giant Cactus recently obtained from Arizona, and represented in the photograph of a group of Cacti published in these page a few weeks ago, in now flowering freely. This is the mecond time this apecies has flowered at Kow in the last five yeara, the firat being in 1891, when a figure was published in the Botanical Magazine. The flowers are 6 inche long, trumpet-shaped, with numerous ahort white petale aurrounding a large cushion-like clater of yellow atamen, in the centre of which is the erect many-rayed utigme. Compared with the colossal stem the flowern are small and disappointing. Hud the floware been on the sma scale as thon of C. Eyripsii (Echinopais) they would heve been about the nize of an ovdinary wash-tab. W. W.

## Tha Weak's Work.

## RRUITS UNDRR GLASB.

By Richard Parker, Gardener, Goodwood, Chichester.
MELONS. - Late crops of Melons often prove useful daring shooting parties in October, but to obtain frait of good flavour at such time, lath batches of plants should be grown in heated pite op honops where a night temperature ranging from $65^{\circ}$ to $70^{\circ}$ can be maintained. If this convenience is a command, and provided the plants are atrong and healthy, it in not too late even now to set a fen fruits. The above-mentioned night-temperature, together with a brisk, growing heat during the day ought to produce ripe fruit towards the end of next month The continued bright weather has proved wom beneficial to the present crop, as ventilation $m$ admitted freely to the fruit daring the latter tugn of ripening, which is very necessary to good flamen, Where the fruit is in different atages of awelling fair amount of moiature can afely be uned while there is sun-heat, but at the first approach of dull, wet weather, great care must be taken to onsure m even temperature, and there must be less atmonpherie moistare. Slight nurface-drensings of fresh loam may be given to sustain the plants in a healthy condition antil the fruits are cut.

TOMATO8.-If not already prepared, a home shoald be got ready for plants that are at preunt standing in pote out-of-doors, so that they may bo removed under cover before damage is done by heavy rains or frosts. A house that has been aved during the summer for Melon-growing may be selected with advantage, as the pots, if small, and full of roots, can be atood on the noil used for the former crop, and allowed to root into the same, Planta occupying large pote will require to be surfasedressed and atood apon bricka, that the drainage may be thorough. Train the fruiting-stems as near the roof-glass as posaible, and continue to shorten back lateral growths, also the strongent foliage to half its length, so that light and air may eavily reach the clasters of flowern. The house should be rentilated freely during bright weather, and a alight circulation in the hot-water pipes should be maintained if the weather become damp. Atmonpheric moistare must be avoided, or disease will follow. Wation rather spariogly. We are testing several varietien for winter work, and up to the present Frogmore Selected has set the best crop. Clusters of fraith eight and ten on each, are ewolling very evenly.

## THE FLOW ER GABDEN.

## By Batuey Wadds. Gardenar, Birdsall Gandens. Fark.

DAHLIAB.-Show and other varieties of Dahlias should be given attention by cutting off all dead fowers as they appear, and by securing the planta againd rough weather. Dahlias are most useful autumb flowering plante, and every indacement ahoold be given them to continue in flower an long ai posaible. Before the plants have pansed out of bloom they should be looked carefully over, suld correct names attached to each of them; or wher this is impossible, diacard the plant, an there nothing more confusing than wrongly-named plath

ALPINE AURICULAB in beds or borders mult bo kept clesn from weeds, and the plants ought now be arowing atrong and healthy. Where the plath are grown in pote, young seedlings snd offres moved are growing il amall pote or boxes should be morne into 5 or 6 -inch pots. They require perfect draimgil and rich sandy loam, with a good quantity of or pite broken brick in it. Place them in frames or pary from which the lights can be taken off duriag ang weather. In winter they must be given that is dry and airy, but free from frosts.

BULBOUS PLANT8.-Seed of these that have been saved during the season shonld now be sown it boxes, and placed in pite from which eevere front en be excluded. Balbs of Narcieans, Lilium candladioAnemones, Tulips, Hyacinthe, Crocus, Iris, Gladive lus Colvillei, \&c., may be planted as moir aman bed or borders are cleared of their bumders occupsit. Those put into herbaceous to trelve should be planted in clumpe of from six to twe that bulbe, and kept as near the front an poom. they mas be readily observed when in bloom.

PRIMROAES AND POLYANTHU8ES that requill Whanting oats should be removed an toon as philithed Where they are growing thickly in oldeeft beds, every other plant should be taken ont.

WALLFLOWER8 may also be planted in their winter quarter as soon as posible．Window－boze sanding in beltertd positions bould be filled with them at once；and tome plant should be putinto pots，in order to fill the vasea in mpring．Thesemay bo kept in a cool pit or house．

CsRNATIONS AND PINK8－Layer and cottigge which are well rooted must be planted out without delay．Give the groand a good manuring，and a li che frest lime at the time of plantiog．Late layers anuald be left on the plants for some time yet，as they do not root mo quickly．

HERBACEOU8 BORDER8－A covsiderable amonnt of cleaning－up will be required at this aemon．The bun dersarevery gay just now with the flowers of Tritoma Uraria，Michaelmas Dainiev，various sorte of Helian－ thus，Anemone japonica，herbaceous Poloxes， Hyacinthus candicans，and Balbocodiums．Annual nown or planted in these borders ahould be kept within bounds．Sach plants as Sweet Peav，Mari－ golds，Tropæslums，summer Chryesnthemume， Pelargoniums，aud annual Scabious should be grown on borders or beds to themselves，or on shrabbery borders．Dahlias，annaal Sanflowert，Mignonette， clump of Tea－week Stocks，and auch plants that will come off quickly may be grown in herbaceous bordern，but they should not be allowed to interfere
 Delphiniume，and other hardy planta．

## THE ORCHID HOUSRA．

By W．H．Weutr，Orchid Grower，Burford，Dorking．
VENTILATION AND SHADE，－The principal work to be done in Orchid－bounes now is the repotting of the cool growing opecies，but while such work is in progreep，there are otber important mattere requiriog attention．Each day has a shorter period of light than its predecemor，and it is necemary to take advantage of all the sanlight in order to sssist the plants to thoroaghly ripen their growth．Gradually expose the collection as a whole to extra an ight，and on every favourable opportunity admit a free circulation of air． In the hottent division，where Dendrobiums atill in full growth．Cyrtopodinma，Renantheras，Gramma－ topbylleme，Vanda Hookeriana，Cattleya upprba， C．Schilleriana，Catasetums，\＆e．，can be accommo－ dated to \＆position by themselves，the plants will now require only the thinnest of shading under any circamstances；but ach plante as Palanopsis，An－ græcum citratum，A．Elliaii，A．Kotachyi，A．San－ derianum，A．pellucidam，Phaias taberculosas， Adxatochilas，Ealophiella Elisabethæ，Cypripediums， the warm－growing Cuiogyne asperata，C．Lowii，and C．Camingi，are liable to permanent injary if exposed to direct sualight．The amount of shading in the case of these，however，may be lessened by not lowering the blind quite so early in the morning， and by lifting them nooner each afternoon．It is im． portant that discrimination should bo used in this matter，and when the blinds are down during the middle houre of the day，it is necesnary to gaard againat over－ventilation， 10 at to minj－ mise the flactation in the temperature through cold winds．Many of the Aurides and Saccola－ biame are till growing freely，and will only require to be moderately ebsded．The deciduou Calanthes， Which sre now commencing to show their flower－ spikes，will scarcely require to be shaded at all；by thue exposing them the bulbs becomestrong and well－ ripened，and the colour of the Aower will be clear and rich．There are fow Orchids that enjov an airy atmonphere at this season more than the Cattleyas， eapacially when there is plenty of man－heat．There is no need to be continually palling the blinds up and domn at every burst of sunshine，an Cattleyas will stand more direct sunlight at this aean than any other，and they will ouly require shade at all for an hour or so during the hottest part of the day． Such species as Jselia ancept，L．sutamnalis，L． albida，L．Gouldiana，L．Marriotisna，\＆ce；Vanda teres，V．Kimballiana，V．Amesians，Schomburg－ hias，Barkerian．Ealophias．Epidendram atro－ purpaream，E．Randii，E．Thizophoram，and Odon－ toglomam citrosmum，also delight in plenty of pashine during theaatamn and snabundance offresh air whenever practicable．Miltonia vexillaria，Colo－ gyne：，Vandas of the anaviend tricolor section，the cooler－growing Aërides，as A．craseifoliam，A．mscu lonum，A．m．Schroderse．Saccolabiam culeste，and the cooler－growing Cypripediams，which，when an in－ termediats－house is not at command，are u＊ually cal－ tivated with the Cattleyes，all require au airy position and moderate shading．The Odontoglosenms，Masde－

Tallias，and other pecien in the cool－house should be protpcted from strong munshine at all timen Those Dandrobioms that have completed their growth and bave for the past fow week been gradually dried and bardened off，may be fully exposed to the aun．Very little water is needed now to keep the bulb plamp．Afford plenty of air by opening the ventilators at both top and bottom，bat avoid cold dranghts．

## THIB HARDY FRUIT GARDEN

By W．Pople，Gardener，Aighclera Castle，Newbury．
PEACHES AND NECTARINES continue to require frequent atcention．＇The growthe should be secured， and tha laterals on vigorous hoot stopped to one leaf．Late kinds need as much air and aunlight an poseible，in order to obtain fraite of good colour and favour．The fruits abould not be shaded by leaves，which may be fastened back；or if this cannot be done，hortened，or taken away entirely． Long appy growtha may be shortened，but this must be done with care，or the diverted ap may undaly pacite dormant buds that hould fruit next season． Treps that have been cleared of fruit may now have old bearing wood that can be apared taken out，and if the shont are thenstill crowded，theymay bethinned freely．Each ahoot requires a apace of 9 to 12 inches in order to ensure the perfect ripening of the wood， and which is the beat preventive of injary by hard fronts． The rooks often require water at this season，and if upon exsmination the borders are found to be dry， they ahould be given a good alking at once，firt breaking the surface if trodden hard aear the wall． Where liftiog bas to be done it hould be attended to in rood time；and before the fall of the leaf．Many good growers transplent their tres periodically，and the roots by frequent re－ moval become a mas of fibres，so that the aliutht check experienced is beneficial in hatening wood ripening，and preventing rampant growth．If any trace of red－ppider be detected，give the trees a thorough washing with claar water three or four days in accession，applying it with force from the garden－engine，and taking care that every portion is well wetted．Any trees that are badly infented chould be treated with some anfo kind of insecticide， afterwarde syringing them with clear water till clean．

8TOPPING PEARB，PLUMB，ETC，ON WALLB． Continue to stop secondary growths on Pear，Plum， Cherry，and Apricot trees on walls，pinching all such to one leaf 10 as to keep the apura close to the wall and to allow of an and sir having free accesa to every part．The shoots must be secured to the wall as they advance in growth，or it may be difficalt on bring them into a proper $^{\text {a }}$ ponition later on．Orergrown apur－prowth mey also now be thinned，catting out one here and there，where they can be spared．If a fow of these are taken away yearly，a neglected tree will in a fow year be farnished with short spars close to the wall and the fruit will be greatly improved in ize and quality．In the case of old exbansted treen，this hould be applemented by clearing away the top soil and applying a good dresing of rich compost to the rootit．

## THE KITOHEN GARDEN

By Johi Lamberr，Gardener，Powis Caste，Weishpool．
8WEET BABIL has made abuadant growth in the open this summer，and thould now be dried for une during winter．Where a green sapply in winter is expected，preparations for growing it in heated pita or in boxes，must be made at once．Sow the aced now， and as soon as the seedlinge can be handled，carefully prick them ont，and an they are very teader they must not be put into a cool dragghty hoaee．A Cacumber－house or Pine－atove will suit them well， but keep them as near to the roof－glass as ponaible．

GENERAL WORK．－Since the raide have come the growth of weede has caused considerable trruble in the kitchen garien，and it hat been difficult to destroy them by hoeing．Hand－weeding is impers－ tive in the cae of nome crope where the hoe cennot be used，bat during dry dayslet all the garden be thoroughly cleaned，afterwards hoed，and if dull weather ensue repps，the operation coon afterwarde．Tarnipesown as advised will now require thinoing．Which will need to ba done twice，or they will atill be left too thickly．Some of the late sowing on poor soil may be left a triffe clower than the other for producing oproatinext spring．Chirk Cantle Blackitone and

Orange Jelly are two good ones for this perpone，and they will atand hard winters well．Let all Tarnipe which are fully matured be pulled，trimmed，and put away in the root－house，an Turnip do not improve by being left in the ground after they are mature． Endive will now require blanching．The blanching may be done by tying the plant when dry－or hetter atill，by placing inverted flower－pote over them If flower pote are used，few only need be done at a time，for when the hole are topped，the blanching procen is a rapid one．Anparagus may now re－ ceive the lat dressing thi season of salt or fioh manure．See that the growthe are not badly beaten down，and any fresh growths with berries attached should be removed．Peas and Beans now exheusted should be removed，and the ground cleaned of all weeds；but if the Peas were sown thinly，and are not troubled badly with mildew， they will make side－growthe if left，and atill produce a few good diahes．Scarlet Ranners will ha bene－ fited by a good making of manure－watar．Broccoli will require to be earthed up，just afficient to keep them steady in case of rough winds．Cabbage and Cule－ wort may be treated the same when large enough． Large beds of old tools that farnished heart for pring catting，which were cleaned of old dead and decaying leaver，and were cut with the inteation of obtaining young sprouts through the winter，will now be making nice growths，and bould be encouraged， for many of them will atand through an ordinary winter．All econd－early Potatos will be bent lifted at once，and if eeed be required，it should be $s \not l e c t e d$. Beds of Early Horn Carrote and also Turnip－rooted Beet may be cleared from the qround．Give atten－ tion to the pricking out Canliflowers and Cabbages for winter work，and dust them occasionally with soot or lime．

## PLANTR UNDER GLAS8

By W H． $\mathbf{s m l t h}^{\text {M }}$ Gardener，West Dean Park．Chichester．
CYClAMENS，if grown in cold frames，munt now be removed to the greenhouse；or if they can be placed in a mall huse or hated＇rame，where the temperature can be kept about $50^{\circ}$ at night they will do mach better，as in the greenhouse they are apt to become drawn．Keep the plante clone to the glans，and lightly thade them during very brigbt weather．Weak manure－water may be given twice a week，and thir may be varied occasionally by applications of weak noot－water．Ae soon as the planta are taken in，they should be fumigated with Richards＇Compound if they are affected with any fly or thrip．Syringe them lightly on bright days until the flowers commence to open，after which the operation should be diacontinued．

WINTER－FLOWERING PELARGONIUMS should now be cleaned of all yellow and decaying leaven，and afterwards placed in their winter quarters．These plants do mach better，and the flowers last consider ably longer，if a small lightairy house can bs devoted to them，and damping will be len likely to occur than when they are growa among otber plante． Before the plante are staged they hould be given a top－dresning with a good fertiliser．If they are not required to flower until winter，the bud may be picked off for a while longer，but on no account ahnald the shoote be stopped，or tbey will not flower natil aprang．

CARNATION SOUVENIR DE LA MALMAIBON．－ Those layers firt potted will now be ready for moving into their flowering－pote，which should not be less then 24 －ize．For a potting compost use good turfy loam， peat，leaf－soil，wood－shes，and plenty of coarse and Pot the plante firmly，and take this opportanity to look the plante over very closely for disesee and Av． If the former is prement it should be eut clean ous with a sharp knife，and burnt．When they are potted the plants may be put into cold frames，whanold Water for a few day aterward，when a thiorough sosting may best worthy of cultivation are Sir Charles Frem－ mantle，Princen May，Mrn．Everard Hambro，Sir Erelyn Wood，and Tae Caurchwarden．

EABT LOTHIAN BTOCKB hhould now be potted into 48 aized pots，which will be found the mont auitable size in which to flower the plante．＇A compont of good loam，leaf－noil，and cow－manure will ait them well．Pot very iirroly，and plange them out－of－doors in coal auhes．Do not water tor a day or two，but afterward give them a good oasing．

## EDITORIAL NOTICE8.

Advertisements should be sent to the PUBLISEER
Illustrations.-The Editor will thankfully recoive and seleot photographs or drawings, suitable for reproduction in these pages, of gardens, or of romarkable plants, Nowers, trees, de.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

## SHOW.

THURSDAY, SEPT. $26\left\{\begin{array}{c}\text { Royal Horticultural Society: Great } \\ \text { Show of British-grown Fruit at }\end{array}\right.$ the Crystal Palace.

## BALE8.

MONDAY, 末EPT. $23\left\{\begin{array}{c}\text { Dutch Bulbs, at Protherce \& Morris' } \\ \text { Rooms. }\end{array}\right.$ Rooms. Dutch Bulby, at Protheroe \& Morris ${ }^{\circ}$ Roome.
Highly important Sale of the celebrated Beech Lawn Collection of Fstablished Orchids, by order of W. R. Lee, Esq., by Protheroe \& Morris (three days).

Dutch Bulbs, at Protheroe a Morris' Rooms.
Annual Unreserved Clearance Sale of Greenhouse Plants. \&c, at The Floral Nurseries, Castie Hill, Maidenhead, by order of Mr. B Owen, by Protheroe \& Morris.
THURSDAY, SEPT. $26\left\{\begin{array}{c}\text { Dutch Bulbs, at Protheroe \& Moris } \\ \text { Rooms. }\end{array}\right.$ Rooms.
FRIDAY, SEPT. $27\left\{\begin{array}{c}\text { Dutch Bulbs, at Protheroe \& Morris" } \\ \text { Rooms. } \\ \text { Orchids, at Protheroe \& Morris' } \\ \text { Rooms. }\end{array}\right.$
SATURDAY, SkPT. $28\left\{\begin{array}{c}\text { Dutoh Bulbs, at Protheros \& Morria } \\ \text { Rooms. }\end{array}\right.$
OORREOTKD AVERAGE TEMPERATURE FOB THE ENSUING WEEK, DEDUCED FROM THS OBSERVATION8 OF FORTX-THREA YEAKS. AT OHISWICE. $85^{\circ} .9$.

For many years of its existence

The British
Arosiation and
Agricalture. this journal, to the extent of half of its superficial extent, was identified with agriculture; and the Agricultural Gazette was reoognised as one of the farmer's stannchest friends and ablest advooates of his best interests. The man above most other men who was noted as the best friend of agriculturists was the Editor of the Gazette-Mr. JoHN C. Morton ; and his writings of five-and-twenty years since are as valuable and pertinent to-day as they were when first this journal saw the light. Mr. Morton has gone to his rest, but the good he essayed to do, and did, has not been "interred with his bones," and of this we have daily evidence; amongst other bodies the British Association has taken up the subject of agrioulture, and in the endeavour to forward its interests has achieved some amount of sucoess, and here it may not be out of place to remind our readers that the Agricultural Gazette's remedy for agricultural distress was summed up in the words, "free land, freedom of contract, suffioiency of working capital, and sufficiency of brain power." The British Association devoted Monday last to agricultare, and preparation had been made for a large attendanoe of those supposed to be most interested in agrioulture; bot the expectations were not warranted by the result. Men of high anthority in various departments of science spoke on the subject of Government aid to education, and the endowment of experiment; on the extension of the work of the Board of Agrioultare; to the pablication of results obtained by experimenters, the duty of County and Distriot Councils in the matter of agrioultural eduoation; but not a word that we can discover on the mesns adopted by fureign agrioultarists to make their trade pay them, and to some extent govern the markets in this country. Some admitted that of most things grown we manage to grow the finest orops-olimate oonsidered; and admitting this, the value of further experiment in questionable; and it being adnoitted that agricultare is an
industry like weaving or iron-working, some notioe might have been taken of the relative position of all in the matter of freedom of action, of the chances of profit in investment of capital in one, as compared with the other. It was gratifying to note appreciation of the fact that whilst the area devoted to Wheat-growing is decreasing, that set apart for Oats and Barley was steadily inoreasing-furthermore that the increase in the number of breeding swine was something like 25 per cent.
And so it comes to pass that, however interesting were the papers read and the oonsequent discussion thereon at Monday's meeting of the British Association - and nothing can be said against their value in these separate respeots-we are forced to the conclasion that the old propositions of the Agricultural Gazette above recorted are as unimpeachable as everfree land for the farmer, freedom of contract, suffioienoy of oapital, and of brain power. Given all these, and this one industry mast prove as successful as any other in the land.

Tillage and Nitrification.

From the earliest period to the present day adequate tillage of the soil has been counselled and practised, but so slow are the processes of the haman mind that although the operation has been practised from time immemorial, it is only now, thanks to the labours of a few chemists and biologists, that we are beginning to realise in what the advantages consist. In the course of a decade or two the physiologists have lighted upon truths of the utmost practical importance, which sucoessive generations of practitioners, from the time of the expulsion from Eden till now, have failed to recognize. The subjeot has been suggested to as by a paper pablished in the Revue Scientifique for June 22, by M. P.-P. Dreteratn, on the "Effeots of Tillage in Promoting Nitrification in the Soil." The oonolusions arrived at are, in brief, as follows:We know now how to take advantage of the phosphates and of salts of potash ; and if we knew at the right time how to convert the nitrogen contained in the humus of the soil into nitrates, agrioultaral produce would be proportionately inoreased.

To ensure much resulta the soil has, from remote ages, been constantly and vigoroasly "worked," but it is only now that we begin to underatand the advantages of such tillage and the conditions ander whioh alone it is beneficial. However thoroughly ploughing and digging be done, their value is but little unless the soil be in a damp condition. If the ferments in the soil whose action it is neoessary to excite are dormant or feeble, and do not begin their work in early epring, the tillage is relatively ineffectual.
The whole question of nitrifioation is dominated by the slowness of the evolution of the nitrio ferments. Rendered inert by the frost of winter, it is but slowly that they begin their work of nitrification, and produce only in April and May insuffioient quantities of nitrates. Hence the necessity for the employment of nitrate of soda; henoe the neoessity for having a fleet constantly at ses, oonveying these nitrates at great cont from the coast of the Pacific.
Now when the ground is damp, well aörated, and the ferments are sotive, there are produced, without any addition, many more nitrates than are necessary. The soil of Guadeloupe yielded, on May 30, 39 milligrammes of nitrogen per 100 grammes, or 390 milligramme per kilo., or 390 grammes, per tonne, or, lastly, 390 kilos. to 1000 tons-that is to say, infinitely more than
is neoessary for the heaviest harveat. In applying the same calculations to the soil from Eureos Loir there were found only the insufficient amount of 25 kilos. of nitrogen.
"What then is lacking?" asks M. Drhiban. Replying to his own question he repeats, "Aotive ferments." Can we go further, that is to uy, oan we oultivate these ferments and pass their nitrifying properties from one soil to another? Can we, in spring, sow nitric ferments in full activity which shall supply the place of thom paralysed by the frosts of winter? In thin an impossible dream? I know not. Leguminow plants owe their property of fixing atmospherio nitrogen to the presence on their roots of nodides filled with bacteria; now, already, on menad ocoasions, the germs of these bacteria harebun transferred from one soil to another with beneficial effect. From time immemorial mad tillage has been practised, the soil having at great oost, been transported from one place to another. For what reason? Whit do these soils contain? These are the problems which are now to be attuoked, but without discounting future possibility and limiting ourselves to present knowledge, we now know that if we put the ferments of the soil into working order, we oan obtain from it moro nitrate than the heaviest crops require, and, if we remember that it is not only under the influence of mioro-organisms that the nitrogen in the soil becomes assimilable, but that it is also by their activity that atmospheric nitrogim becomes fixed, that it enters into the oycle of organised beings, we reoognize how trae and how profound was the saying of M. Brbtheion, "The earth is a living thing!"
The paper concluded with an eloquent tributh to the genius of Pastrur, by whose laboun the nature of fermentation and the principles on whioh the manufacture of wine, beer, and vinegar depend have been elncidated. Pastras has investigated the parasitio organisms onusing disease in silkworms and domestic animals, and shown how their malign influenoe mas bo controlled or abolished. It is he who has devised "vacoines" which prevent the dertructive effeot of epidemic diseases on our flocks and herds. Moreover, the obsonrity whioh surrounded so many of the diseases of mankind is gradually being dissipated. II Pastrur teaches us how to cope with hydrophobia ; one of his pupils neutralises the poison of diphtheria. But to oure sick mankind is not sufficient. The healthy mast be fed, and nor we see more clearly how this is to be 2000 m. plished, and we recognize to-day that the fertility of the soil is due to the action of the fermentil which it contains.

Royal horticultural society's falit SHow. - On Thareday, September 26, and tmo following deys the Royal Hortienltaral socied' Great Show of British Frait will be held at Cryatal Palace. The exhibition, which promien to be even a greater anccem than that hol year, will be opened by the Lord Mayor, Sir Josill Rerals, at 12.30 on September 26, when he will be accompanied by the Sheriffs and the Mastra Warden of the Wormhipful Company of Gardasad A public luncbeon will be held on the mamed om 130 in the Grand Saloon, and will be prosided will be by Sir Trevoe Lawrexce, Bart. Lactures Hall given each day of the show in the Garden Froith d 3.30 ae follows: - September 26, "Now Hraiz 2í, Recent Yeare," by Mr. G. Bonrard; Seph Pusear "Praning Fruit Trees," by Mr. A. H. Pumerien September 28, Prize-ennay on "The Crerman Aopect of Hardy Frait-growing." Narestibit widet others are particularly requested to exthibit
the achedule. By direction of the Council, exhibit outaide the chedule will only receive card of Commendation according to merit. Vegetable, other than Tomatoa, are not allowed to be shown. With reference to exhibits outside the schedule, exhibitors should bear in mind the new rule adopted at the auggestion of the Froit Committee:-"All collections of fruit are limited to 100 dishes or bakkets, and all dishen or bankets must be of distinct varieties of fruit, no duplicates being allowed."

Beddinaton, Carbhalton, and Wallinaton horticultural Society. - The above
tributed by the trade and private growert, and County Council Certificates will be granted for specially meritorion production. The Hon. Secretary will furnish further particulars on application.
the Aoulteration of Attar of Robe.The difficulty in obtaining pare otto or attar of Rose in the European markets is a fact well known to all. Andropogon oils play the largeat part in thim "yatematic adulteration, but "Geraniam oil" from Pelargonium capitatum also taken a place. Some new features an to the authore of this adulteration have jast been brought to light in the Report of the
the otto may not be tampered with after reaching the merchant's hands, there is no means of enturing that the peavant, whose atock the latter buy up, hat not already adulterated it. Supervision during distillation is no guarantee, for the ingenious peasant is in the habit of aprinkling essence of Geravium over the freahly-gathered Rose before dintillation, in order to increase the yield. Congelation at a certain temperature, which is principally relied apon as a tent of purity, is quite fallacious. Thewe are new lights in the preparation of attar of Rose to which the attention of our perfumer will, no doubt, be directed, eapecially when it in considered the enormous price this pro-

Fig. 62 - ABCEPNANTEU8 mILDBBRANDII: FLOWERS ORANGE AND SCARLET. (sER P 324 )
(The single flowers to ther $r_{\text {- }}$ - siuldy of the plant are of natural dize.)
mociety, as Mr. G. W. Cummins, the Honorary Secretary, requeste us to inform our readers, have, in conjunction with the Sarrey County Council, arranged to hold a special thow at the Pablic Hall, Carshalton, on October 16 and 17, of vegetables, fruit, tec, and also a large representative collection of Potatos from trial plote in various parts of the county of Sarrey, grown ander the Technical Education Committee, to as to show the effects of diverso soils on the yield. Addresses will be given by the Sarrey County Conncil's inatructorn on horticulture on "Fruit and it Caltivation," and "The County Potato Experimenta." A fow prize will be offered for local cottagers' produce, whilat proviaion will be made for collection of regetables and frait cog-

British Consul at Sufia, in Bulgaria, where, mpeaking of this importint induatry, he ayy, the adulterstion to which otto of Ronem hae always been subjected seems hardly to have been checked by the prohibition imposed by the Government on the importation into Bulgaria of the adulterating madiam, essence of Graniam. Indeed, the quantity of otto which reachen the European markete in a pare atate must be very mall. Lat summer the British Chamber of Commerce at Constantinople sent a delegate to Kesanlik, the principal otto-produciag centre, with the view of procaring an aboolntely pure sample, to serve as a atandard for purpose of comparison. This gentleman, however, was obliged to return empty-banded, for he ancertained that though
dact realises. In connection with this peculiar and limited induatry, it in interenting to note that the cultivation of the Kexanlik Rowe has been atarted with some aucceat at Brouma, in Asia Minor, by Manalman refugees from Bulgaria.

Newcabtle and Dibtrict Horticultural Mutual Improvement Society.-The first meeting of the fifth seasion of this wociety was held at their room, 25, Wentgate Road, on Taenday, the 10th inat. The chairman, Mr, Bulloce, preaided over a good attendance. A paper entitled "Botany, as an Aid to Obaervation," by Mr. Jas. Scotr, Ferndene, Gateshead, wat read by the Secretary. By the discuasion which followed, it was evident that Mr

Scort's paper was the means of creating a good deal of enthaiasm on the part of the younger members to know more of the theory of their basinesf.

Californian Notes.-Mr. J. Buett Dafy, of the University of California, kindly send us three photographs, which, interenting though they be, are unsaited for reproduction. No. 1 is of Quercas agrifolia [?], Nés, as it grows on Mare Island, San Pablo Bay, Cal. It illantraten to some slight degree the carions effect of the cold westerly trade-winds in ahaping the outline of exposed trees. These keen winds, in many cases, abolately prevent growth on the exposed side, causing a curionsly "lob-sided" development; often indeed, in such sitastions, Quercua agrifolia, and especially Umbellulari\& californica, grow up conformably with the contonr of the hill behind them, being practically flattened out. No. 2 is a photograph of a lady atanding in a clump of wild Mustard (Brassica nigra), which often growa from 8 to 12 feet high, taking exclusive possension of fence corners and rich waste lands. No. 3 illuatrates a hedge of white Marguerites (Chryanthemum frutescena), 4 feet high, with a background of Quercas agrifolia [?] and Pines.

Opium and Morphia in China,-It is atated that concurrently with the decrease in the importations of foreign opiam into Amoy, it is found that large quantities of morphia are brought in, as mach as 800 ounces having been imported daring one month. A considerable portion of this is ased for hypodermic injection, this practice being greatly on the increase, and it is carried on at many establishmenta in the city. This habit is judged by medical men to be more injurious than opium moking. Habitual opiam amokers taking to morphine injections are enabled to abstain from the opiam pipe, but are by no means cured of opium amoking, as cenation from the injectione inevitably leads to an increaned indulgence in moking. Moreover, no care is taken to keep the syringen properly clean, and evil consequences frequently realt from the insertion of dirty instruments into the skin.

Agricultural Teaching in Aberdeen Uni-versity.-A conference took place on Friday, 13th insto, in Marischal College, Aberdeen, in reference to the proposed introduction of agricultaral teaching into the Univeraity. The apecial committee appointed by the University Coart in connection with the matter, met representatives of the Aberdeen County Council and Town Council ; Dr. Smitre, of Newhille, preaiding. The whole matter was fally discusced, gratification being expressed at the reaponse made by the pablic bodies, inclading $£ 200$ from the Town Council, to the proposal. The meeting came to the conclunion that there wan now a atrong claim for a liberal grant by the Board of Agricaltare, and it was remitted to the convener to asist the factor (Dr. Hontse) in preparing an estimate of the probable income and expenditare for the current jear, on the footing that there should be a lectarer on agricultare, and a meparate lecturer on segricultaral chemistry. The meeting on thic understanding adjoursed, till a reply should be obtained from the Board of Agriculture.

Botanic Garden, New York,-The tract selected comprises 250 acres of the most denirable section of Bronx Park, near the old Lorillard mansion. Included within the tract is a beantifal grove of Hemlock Spruce, which was not only the pride of the original ownerr, bat remains to-day one of the chief attractions of the park. Provision for its preservation is therefore made. The firat advance towards this object was made when the Torrey Botanical Society of Columbia College was fortaed. In 1891 an Aot was pawed suthoriving the project, but it was inoperativ* owing to the violation of nome constitutional provivion-the failure, it was asid yeaterday, to include is the bill an anthoriation of the city to is*ne bonde while appropriating the needed money. This defeet was overcome hy the enactment of chapter 3 of the lawe of 1894 . The muecene of the
project was ancured on June 18 lat, when,
meeting held in the office of President Setr Low, of Columbia Colloge, the assurance was given that the necessary 250,000 dols. to be secared from private sources had been subscribed. The site of the new home of botany is beautifully adapted to the growth and caltivation of flowers. In addition to the grove of Hemlock, which includes the entire went bank of the river within the tract, there is much protective wood. The Bronx farnithes abundant water, the oil is fertile, and there is both low and high lying land. The plot of 250 acres includes one-half of the entire length of the gorge of the river, which has been so often admired and sketched by artists. The natural scenery in delightiful, and the garden will be worthy of itn magnificent cenic setting. The citizen of New York will before long be able to point with gratification to a auperb exhibition, not only of our own flora, but also of the variegated and fragrant plants of other climes, equal to anything in Kew Garden, or in the famous gardens of Paris and Vienna.

Weeds. -The Bulletin of the Kanoas State Agricaltural College for Jane, 1895, contains descriptions and figares of the seedling plants of about 150 common weeds of the slate. The utility of auch work is so obvious, that it is to be hoped the managers of our village achools will net their children to work to discover and detect the seedlings in the fields and hedge-rows. In many cases this work may be done even in winter, and may be made interesting to the children.

Machinery Exhibition in Vienna.--The Consul-General for Aastro-Hangary (11, Qaeen Victoria Street) send an the following note:" Encoaraged by the great succens of the Exhibition of Agricultaral Machinery, held at Vienna during May lant, the Imperial and Royal Agricultaral Society in Vienna has decided to hold a necond exhibition in May next year. The prospectus will include not only agricultural machines in the atrict sense of the word, but appliances used in all branches of induatry connected with agricultare, such as breweries, diatilleries, yeast, sugar, vinegar, and atarch factoriea. The mart will almo extend to tools and engines used in foreatry, anw-mills, celluloid-factorien, orchards, vinegards, in the feeding and breeding of cattle, borses, fish, \&sc. It will comprise electrical machines aned in the service of these induatries, seeds and manares. Provisional applications for apace (which will not be considered binding) will now be received by the Committee of the Second International Exhibition of Machines. I. Wiens, Herrengasse 13, Austria. W. Prinzig, Acting Imperial and Royal Consul-General."

Nicotine Poisoning from Eating Grapez. -A paragraph bas been going the round of the papers, drawing attention to the poisonou natare of Grapes gathered from Vines to which nicotine has been applied as an insecticide, it being atated that neveral alarming cases of illness had been no canaed at Dorchester. In anower to our inquiries, Dr. Fismer, of Dorchenter, has furnished ue with nome particulars of the occurrence alladed to. It appears that aboat aix weeke fer a a vinery was famigated several times witu a preparation described an containing "the pure nicotine of tubacco in a highlyconcentrated form." The Grapes were not syringed or tonched in any way afterwards. A bunch of thene Grapes were partaken of by a lady and her daughter. The danghter soon afterward became deadly pale, felt ill, vomited, and, after lying down for some bours, recovered. The mother was more seriously affected. She felt giddy, turned white, and, after lying down, became quite cold, weated profasely, and thought he was dying. After vomiting, however, she slowly recovered, bat remained much upeat for the rest of the day. Another bunch of these Grapes was given to a lady and her child, soon after which the lady fainted, and the child was aick. A atrong young man ate a bunct in the train or his way to London, and he also wan most violently sick and ill. Another lady ate three
bunches on different occasions, and after each fetit giddy, and had to "hold on to the table;" the neither felt sick nor tarned cold, bat it thould be mentioned that she is accustomed to amoke. The cook also "felt very queer" after eatiog s banch. In three of the above casee, the aymptom were alarming, and all saffered considerably. Df. Fisher says it is manifestly difficalt to explain thess cases on any other theory than the one adrauced-namely, that the aymptomu were due to nicotine poisoning. The victime wero all people in robust health, never given to anch attacks, and they did not live in the same home. Tae importance of the subject is increased by tho fact that this preparation has recently found grow favour with gardeners and others on account of is great inacticide powers, and that although it is definitely atated on the label that it contains concentrated nicotine of tobacco, it is equily definitely stated that "the proprietor wishes it to m clearly understood that it contains no injuiew ingredient whatever." Perhapa not injarion to plants, bat the phrase is open to a double meaniags. To state on the label that the componnd shonld be kept in a safe place out of the reach of children in perhapa a roundaboat way of aying it is a poinon, but we prefer the shorter term. British Medied Journal, September 14, 1895.

Shirley and Surrounding District Gardeners' and Amateurs' Mutual Improvement Association. - The monthly meeting took place on the Parish Room, Shirley, Southampton, on the 16th inst., the President, Mr. W. F. G. Sprangara in the chair. The subject for the meeting was "The Caltivation of the Fuchsia," contribated by Mr. E. G. Wilcox, gardener to Col. W. Sinkins, Aldermoot Hozase, who is well qualified to apeak on the anbjecth he having gained first honours for the best ix Fachaias at the late Southampton and local shown Qaestions were pat to Mr. Wilcox on the abjett of manuring, potting the plant, and the anes to wieh Fachaias might be pat in bedn and bordert, all of which were atiafactorily replied to. A cordial role of thanke was accorded to the author of the paper, The attendance of membera was very good.
an exhibition of Vegetablebat Briahton, SEPTEMBER 12, 13, AND 14.-A vegetable show mu held on the above dates in the atore-rooms of Manti. Tilley Brothers, needamen, of Brighton, excelleat prizen being offored in upwarde of twenty clames, for all of which there was a keen contest, exhibis coming from all parts of England. The prineipal clase for a collection of not less than six kind brought eight exhibite. The lot prize fell to 监: H. Stevens, of Eaat Preston, Worthing. with sutumn Giant Cauliflowers, Satisfaction Potutan Autocrat Peas, Giant Ranner Beans, Snowball Tarnip and Onions, good Carrota, Marrowe, Lokk, and Tomatos. Potatos shown as single diabes mere excellent, especially Mr. H. Stevess' Snowdrop Kidney, and Mr. F. Clarg's Zanith. Upwarde of 200 dishem were staged in the variout clanen, and the show (the firmt of the kind held) was a great anceear.

Nova Scotian Apples. - The condition of the Apple orchards in the principal fruit diatritith according to the Government Report, is very atiir factory, with exception of Bear River, where s crop of not over 35 per cent. is expected, snd West Cars* wallis, where a small crop is indicated, although the bearing trees look well. Complaint is made of tho Baldwin, both at Bridgetown and Aylesford. Tho Aylesford Gravensteina alro do not seem to thim blossomed as fully as uenal. Other reports intirs King's County are:-fruit well net and maw wo eatiafactorily. The crop promises to be quiv arper average. Well net, clean, and mooth, crop aperaid but 25 per cent. less than the great crop of mivir Pests not troublemome. Present appearacace mith malh factory; no injary from insect pestal. Sab prospect good; some at Paradise have carber. and rollar. Crop not large, bat quality promil. Two be very good. The crop is mataring melijfremeth Plam crop is reported variouly from did
dietricts, mostly unfavourably, but there will probably be an average crop wherever the trees have beon reasonably well attended to.

Royal Botanic Society of London.-In the Victoria tank of this Society, in their gardena, Regent's Yark, there ir to be ween one of the fineat plants of the Victoria Regia ever grown in this countrg. It covera a apace of over 400 equare feet, pach of the eleven leaves measaring more than 7 feet reross apart from the tarned-up rims, which stand 6 or 7 inches above the water. The flowers are pink, and follow one another in quick pucceation, rising jast over the centre of the plant. Visitors to the gardens ahould see it now, while it is in ite greatest perfection, as, being grown as an annual, it will shortly begin to decay.

Mr. Barron's Retirement. - Concerning this matter, Mr. A.H. Smess has ment us a copy of the following letter, addressed to the Presideut of the Royal Horticultural Society, which we publiah in full:-"My dear Sir Trevor,-I mould be wanting in courtesy to yourself and other member of the Conncil if I did not give you notice of the questions which I propose to ank at the next annual meeting of Fellows, or at mach early period as the Council may think it denirable to call the Fellows together for the apecial parpone of taking them into their confidence. I shall require the prodaction of the minutes of the Council which appointed this apecial committee to report upon Chiswick, the date of it appontment, the namen of the committee, the reference and the scope of its enquiry, the report it made, and all the correnpondence emanating from the secretary or other officer relating thereto, also a atatement of the proposed changes in the management of its Chiswick Garden. I shall almo ank question which will require the production of the minute-book of the Garden Committee, and also the minutes of all the committees (frait and fioral), which visit Chiswick for the purpose of the reed trials, \&c. The logical outcome of the action of the Council (if the rumours are trae), by superseding the atandard committee and the appointment of this special committee, and not conalting them on their Cbiswick Garden, implies a direct vote of censure on all members of these committees, and is equivalent to a vote of non-confidence in the competency of the Garden Committee. The Council mast see that by the appointment of thi Special Committee questions are raised which are far more reaching in their consequences than the consideration of the dimmiasal of an old employe. It is a pablic announcement by the Council to the horticultaral world that they have no confidence in the ability, kill, or integrity, of the forty or more members composing their committeen which visit the gardens at Chiswick, and thiv, too, at a time when otheri like myself are endeavouring to raise the atandard of judging at local horticultaral exhibitions with a deaire to place the judging above the auspicion of local inflaence. The manager of these local hows bave aelected their jadges from members of the fruit and floral committeen, who, the Council by it action, have considered to be unworthy of confidence for conaultation ar to the management of ite own garden. How will it be powible for the manager of local shows to continue to employ them as judges? What, too, is the position of the members, who are employed in giving technical instruction, and acting as public examiners of candidates' papers on horticulture? To my mind their character is at atake, and some action mut be taken in this mater where everything depends apon confidence. The Council mast, at a public meeting, justify their action, or retract their proceedings; they must either rehabilitate the cbaracter of the members of these committees, or reconstruct the committees. The sonner the matter is cleared up the better, for the uncertainty which overhangs the question is doing no good to horticulture. The least that can be the outcome of thi unfortanate action of the

Council will be that ite proceedings have been most unbuainesalike, and that they have anintentionally committed an uncourteous and ntupid blander."

Fruit Essay Competition.-In consequence of the excellence and equality in merit of two of the easays on the "Commercial Aspects of Hardy Fruitgrowing in the Uaited Kingdom," the Council of the Royal Horticaltaral Society increased the prizamoney originelly offered, and Mr. L. Castle, manager of tha Dake of Bedpord's experimantal fruit farm at Ridgmont, with Mr. S. T. Whight, Glewaton Court Garden, Roas, have hat the honour of being awarded equal first prizos. Oas of these esaay will be read at the Cryatal Pulace fruit show, and both will preaumably be published as soon afterwardas posible. Tha adjudicators were Mr. A. F. Barron, Mr. J. Weight, and Rev. W. Wiles.

Australian Timber.-It has for years been a pleasant daty to record any endeavour to popularise the use of Australian wood in this country, whether for paving or upholstering purposes. Gradually the Eacalyptus and other large timber treem have become popularly known, if not as popalarly used. To-day our vehicular traffic is carried on over roads constracted of wood from the Antipoder, and promise is not wanting that New Zasland and Australian timbers will soon obtain higher rank. The Manchenter Ship Canal Company, we believe, are endeavouring to make a market here for the wood noticed; they have bronght, and contiaue to bring, to Manchester what may be looked upon at pioneer cargos for that section of the indutrial world. The venture, we have been informed, hat so far been accesaful, and there is no doabt that, when the capacity of the Eucalyptus is better known, it will enter in anccesuful competition with most kind of timber now on the market.

TijD8Chrift voor Tuinbouw "-The three first monthly parte of a ne horticultural journal have bean published at Gröaingen by Mr. J. B. Woutires. The publication is edited by Dr. Bos, Measts. E. H. Krblage, Lionard Springer, and others, and is illastrated with coloured plates and other illastrations.

## AN ORCHID COLLECTOR.

David Willias Alexander is probably known, either personally or by repate, to everyone intereated in Urchide residing in Grenada and Trinidad. In appespance he is a strapping big fellow of the African rac., and has a mloment face and pleseing manuers. Hir home in Grenada is called La Digue, and when at home be is, a geatlomax in a cloth
suit, and whining bleck shoes, His costame when collecting, however, is very different: he then dons a atrong canvas ait and peaked hat, and no shoes. A very sharp-edged cutlant hange from his aide ready for emergency. He works very hard, and can undergo day together the extraordinary work of collecting, during all sorts of weather, alone in the deepest wood, where he often sleeps, on eme branch of a noble tree, out of reach of the wild animals which roam around him at night in search of prey, and whofill the forest with weird noisen and screans like those from haman beings. $H$ e is woodeman enough to know the bird or animal that vente hie feelinge in such a way; whowe hises and roars, or plaintive note belp to denude the night of the awinl atillaess that reigns through the forest by day; which of the two is pleasanter is best known to one who has experienced both, but Alexander gets his snatcher of aleep in spite of them all, and resumes his searchings as day dawns. Up in the topmost branches he is able, through long experience, to detect mall Orchid where others might search in vain. Sometimes he has to fell the treen to obtain his treasares, and generally being alone, he has to carry his rich but heavy loads many miles to the nearest place for shipment. He does a great deal of collecting in Venezaela for gentlemen ia Trinidad. From thence he has already brought to light one new Orchid-probably more; and it is probable that among bir recent collection more will be added to the known list of South American Orchids. Of the Trinidad forms, he appears to know the habitat of each one. Ever since Mr. Prestoe's timein Trinidad (a former (Government hotanist there), he hae, I believe, been a collector of Orchid. The very few commercial Orchids native of Grenada offer no inducement to the collector; hence Alexander's frequent journey to Trinidad and Venezaela. His large collecion at $\mathrm{L}_{\mathrm{a}}$ Digue, Grenada, represent a choice selection of plants, and are sold as often as a good offer presents itself. All these plants, with few exceptions, are mounted on blocks. Among thene might be instanced: - Oncidinm Papilio, O. lanceanam, O. citrinam, O. laridum, O. hrematochilum, O. altissimam, O. iridifoliam, Diacriam (Epidendram) bicornatam, Gongora macalata, Coryanthes pecies, Cattleyas, Rodriguezia secunda, and Cycnochen species. These are, however, but \& few, noticed when the writer paid the collector a visit about a month since.
A word more of his home. La Digue is eome 2 to 3 miles distant from the town of Grenville, or, say, 14 miles away from the town of St. George, the principal port and town of Grenada, where the mail stearaer companies and otber hipping have their depôt. His house, which atande amidst a amall Cacao plantation of his own, is kept beautifully clean. He evidently lives a very pleasant bachelor life, and on good terme with all mankind. W. E. Broadway, Botanic Garden, Grenada, B. W. I. 4ugust 22, 1895.

## home Correspondenoe.

CAMPANULA NITIDA.-AB we were promised that there should be a review of the garden Crmonulas, which were to be grown and examined at Chiswick, I have been esgerly looking out for momothing about (that ancient sad mystorious garden plant, C. nitida botaniets, though too enatioue to ay wo, would agres that the plante which pave ie gardens and herbariams under this name, and which are anid to have flowert either blue or white, single or double, are nothing more than permanently tunted forms, probably originating at different times, of C.paracifolia. The oldeat figure of tha alleged macien in in Dodart' Histoire do Plantes (Paris, A D. 1676), where is is called Tracheliam americanum minu: tlore coeruleo patalo. Since that date it has had at leat half-adezen names. Its hiatory incarefuliy invantigated by De Candolle in hie Monoyraph of Campanula, p. 313. He aryn he fond it in many herbariums and gardens. rarying from 6 to 18 inctem high, the specimens agreeing in nothing but the flowers, which ware precisely those of C. perncifolis, but maller. He nover could obtaia a aeed of it, and found it die of
cold in very severe wintert. This seems hardly conaistent with ite elleged habitat, Arctic America; but it was probably referred to America by gardeners for the asme reason that many plants were referred to Jerualem a century earlier, because no one waa likely in thone days to go there to look for them. America during the present centary has been pretty well hunted for plants, and Asa Gray in his Flora of North America, says of this plant " vaguely attributed to North America, wholly unknown in a wild state, apparently, allied to C. peraicifolis and not North American." My experience of the plants acld as C. nitida is that they are not consistent with one another; but most of them if planted in good rich oil, either develop their growth into typical C. per-P.S.-If this alleged species were lost, I woald undertake to make it again in a very fow yeary by a velection from dwarf form of C. pernicifolia. C.W.D.

ERITRICHIUM STRICTUM (?).-A most beautiful and continuously free-blooming hardy annual, with deep blue flowers, was sent to me in the pring of last year by the Rev. Theodore Marsh (the wellknown raiser of hybrid Lachenalise), of Cawaton Rectory, Norwich. He wrote to me when wending it that, being perfectly hardy, it required no special care, and nually sowed ita own seed freely all round wherever it grew, so that by transplanting the seedlings in the spring, it could be made use of wherever a border of blue flowers wan wanted in the garden. I transplanted my self-sown eedlinga accordingly this pring round one of my beds of Lemoine's Gladioli, where they have bloomed continuously and most profusely daring the whole ammer, and have been much admired by all visitor to my garden; to none of whom was the plant known, and nearly every one asked for the name, and wished to know where they could obtain eeed of it for next year. The amall deep blue flowert exhale a atrong perfume, comewhat reaembling that of the flower of the common Lime tree, and during the aunny hours of the morning they are covered with flien, been, and other insects, who seem to find the odour very attractive. I have not been able to find the name in any of my books of reference, except the Inder Kewensis, the horticultural dictionaries only mentioning one pecies of Eritrichiam, the pretty little alpine, $E$. nanum. I sent some flowering specimen to Memrs. Catbush, the well known London nurserymen and seedmen, who wrote me that they knew it, and sold seed of it ander the name of Eritrichiam nothofalvum; and to them I have accordingly referred all my friend for meed of this mont ornamental plant. On referring to the Index Kewensis for this second apecific name, I find it is said to be ynobymozi with Plagiobothrys nothofulvus. I also went flowering specimens to the Herbarium at Kew for identification, and the learned botanical anthorities there asid it wes not an Eritrichium at all, but apparently one of the Hound's-tongue family, Cynoglonam furcatum, figured by Wight in hin Illustrations of East Indian Plants, vol. iv., t. 1395. I hope some of your readers will recognise and give the correct name of this plant. W. E. Gumbleton.
aLUGS AND WORM8.- You mant be almost, if not quite tired of the above aubject, bat I know not how to get information except by jour paper. If Mr. W. T. of Binhop's Teigaton, South Devon, will kindly allow me, I will send him one of the earth nugn if I find that they have no shell, which I have not noticed at present. Perhape "W. T." can tell mo how many corti or varietien of the little fiuk called aticklebacky there are? I. Walton only mentions one; but I am told one variety hes three apines on it back, another two, and a third has only one spine. Robert Warner, Widforà Lodge,

JUDGING AT METROPOLITAN ANO LARGE PROVINCIAL HORTICULTURAL EXHIBITIONB. Permit me to suggent that, at all important open competition of this kind, there hould be an expert (say, from Royal Horticultural Society), in attendance as a warutineer, to see that no point of merit in the exhibits are overlooked, and if any error occur, that it may be pointed out before the adjudicatora leave their work. Generally men of notable poaitionm are eelected an judges, taker, and a scrutineer all, they are liable to mirecuring jutice in each would materially aniat in their judgment se perfect ward. By thut making be of the greatent value to ponere the, they would inamouch ar thousand go to memier local nocieties; the point of merit in the mords, and taw to study
afforded. Consequently, judge at local showi are often twitted if they endesvonr to correct evident orrors; and sometimes they bring undenerved contumely on the judgen, quibbling and cavilling between competitor and committeen. I could inftance some 2wards at a high-clasp provincial show recently held, which have borne fruits at absequent chows, and which farnished pegs for the nonplated competitor to hang his quibbles upon. $P, M$.

HARDINE88 OF CLEMATIS DAVIDIANA.-It maY interent your corrempondents in to-day's number of the Gardeners' Chronicle to learn that the Clematis open groand. It was planted about a year ago, and is now a nice bushy plant, covered with grey-blae flowers. We did not admire it very much at firat, but now it has gained upon our affections, and there is no longer "a talk" about digging it up ! It has the great recommendation of novelty-so dear to ladien! $H_{0}, M_{1} E_{\text {. }}$, Leamington.

A VINE 8PORT.-I looked in the other day to see some of the wonderful example of fruit, plant, and flower culture at Mr. Thomas Rochford nurneries, at Broxbourne, Herts, and was shown a very remarkable instance of variation from the original on a Vine of the Black Alicante Grape. The rods are not of great length, and they are furninhed from base to summit with splendid bunches. There is no question here of the transfusion of sap by grafting. The Vine for 4 or 5 feet from the base is producing bunchen which are undoubtedly Alicante; the apper part of the rod about 6 feet or more is producing Grape altogether different, and resembling in size of berry the Gros Colmar; but, the leaves and wood are not of this variety, nor are they quite identical with Alicante. It is cariou* that the Vine should thas break into a new character at a certain point, and retain it to the very top of the cane; in all my experience of Vine growing I never knew auch a case as this. The difference in the berries is momarked that it cannot escape observation. J. Douglas.

THE DOUBLE-FLOWERED DAIBY.-I was very pleased to nee Mr. E. Bennett's remarks on these flowers in a recent issue of the Gardeners' Chronicle, p. 206. I have seen Daisies at their best in the three place named-Aston, Cliveden, and Belvoir, and have no heaitation in placing Aaton first with this lowly flower. It was well worth the journey from Bary to Birmingham to see the Aaton Dainies in the heyday of their freshnese and beanty. Mars was indeed marshalled into might as Diny edgings extended into mile of broad bands, or furnished enormous massen of beds and border of brilliant colours. The Daisies, in fact, were the eyes of thone beantifal garden, when mpring gardening at Anton was at its best, Mears, Fleming at Cliveden, and Wm. Ingram at Belvoir, each mede good use of Daisie in those great examples of apring gardening. But in thete the Daisies were accessories rather than principals, as at Anton. And now, through no better reason that I can diacover than the caprices of fashion, the employment of Dainies is on the wane: spring-flowering bulbs, annuale, Violas, Primrones, Aubrietian, Arabis, \&c, having crowded them out from many a spring garden, and other plant are also tharing the same fate. A few years ago it was no uncommon thing to see many thoumand of Forget-me-Nots, mostly of the best of all the early-flowering varieties, viz., Myonotia dinnitiflors propagated for apring bedding every jear; but now Dainies and brilliant contrsat to the sapport to the Dainies and brilliant contrsat to the jellow Primroses in anch bold and telling massen as were common at that time. Writing of Daisies, it is to be hoped that we may not low the quaint Hen-and-Chicken form amid our changes of fashion. Farther, doen any reader of the Gardeners' Chronicle posses the white-flowered Hen-and-Chicken Dainy, or has anyone Deen auccenalin raising new forms of this curious and intercatiag plant? Perhape the introduction and illatration of the new Dainy, Bride, and Mr. Bennett' interesting and informing letter may do very much to restore the Daisy to its old place, power, and popularity in our apring gardening.

TRIAL8 AT CHIBWICK, -A recent wrangle over the nomenclature of Bean, with a parposelesa remalt, led to the atatement being made on behalf of Chiswick Gardens that everything sent there for trial was not tried. That such is the case is due firat, to lack of apace, and second, to there being no trial of the particular producte taking place that suan. There is a general sasamption in the
country that any one may unnolicited aend anything oblivious of the fact that one thing grown doen not oblivious of the fact that one thing grown doen not
conatitute a trial, but that real teate of value a found only when the beat representativen of ang one product are grown along with new-comern. It wh doubtless under anch conditiuns that the Bean, the unfortanate object of a sharp diacuasion recently, wh in 1885 put on one side at the time, and was, with many other things, probably relegated to the dautheap after the seed bad become sterile. There can be no doubt, however, but that the best work done by the Royal Horticultaral Society at Chiswick in found in it annual trialn, and it would be indeed a grave miafortune were any cheme, however valuable, that may be proposed to govern Chiswick operations in the future, should in any way interfere with or militate againat the continuation of thene trind There are timet and seasons when these triald $w$ most accesaful, and others, when arising fiom adverse measone, they are less so. Theme are accidents which always arise in gardening, and may not be absolutely under our control. None the lens, theno can be no doubt whatever as to two thingu. First, that every effort of which the garden ataff ham been capable have been put forth to conduct these triale succeasfully and impartially; and, second, that the respective committees, when they have ansembled at Chiawick to examine realte, have done so in spirit of abolute impartiality, and entirely devoid of bias. I have aeen a good deal in connection with these trials, as a member of one of the committen and can traly aver that those membera who attend the meetings at Chiswick, and be it underntood do to at personal and pecuniary acrifice, come to their work with the honest desire to be juat and impartial, and nothing more. Very rarely indeed is it that : member has any interest whatever in what may bo under trial-and if he have, then he is invariably absent. Only recently, at least no far as the Fruit Committee is concerned, does it seem to have been the practice for that body to call for a trial, which in now done in the form of a request to the Council to anthoriw a trial of some particular product during the ancceeding year. When that committee finds certain products apparently new, or at least professedly 00 , constantly coming before it, what wonder if it ak for a trial of that product at Chiswick, becaute 10 many claimants for honour being in the field becomes rather monotonous, as well as puzzine A good trial helpa to clear the sir of dubious claim for superiority, and often hows that novelties n called are neither novel nor improvements. A nof able trial requested next year is one of Cucumbers. This is a vegetable with which undoubted advanco has been made during the past ten years, but atill ina quite so great an to justify the production of at lemi a dozen new claimants for honours in one year No wonder, with to many Richards in the field the the Fruit Committee felt the best courne wi invite the Council to promote a thorough trial a these annamed new and entablished older sorts Chiswick next year. It is practically impomible fot any committee to deal natinfactorily with Cucamberi at the table, especially when the exceedingly fine handsome varieties in commerce are remembered. In asy improvement or advance is to be fonad if ce d only be in the direction of greater precocity cropping qualities. It is very eany for "Heads" Tails to ancer at these trials, bat a seat on the committee for a year or two helps materially thes teatify to their exceeding necessity. Bat of emaina the difficulty as to the efficient conducs of Cucumber trial at Chiswick. Without donbt beat resulte are invariably obtained in lowolping houses, such as are found in market or seed grom so eatablishments, where Cucumbers are grom is admirably. There is, so far as I know, no hou is wo the garden suited for a trial, and if the traad The have any value a big one must be conducted. in best results are also got when plants are gtro pots or boxes of restricted size, or in shable. The nal for root-area muat be not too conniderable.
also ahould not be very far from the glast. uch conditions to be farniahed? If daring the Council could erect in the gardens s pan houne, ayy 100 feet by 12 feet, central alley, they would then provide lac Tomatos, and nuch a house kreat service in the garden in There are one or two exceptions perbaps general good succem attendant on vege he gardenf. Peas do not alwayagrow the soil is very porons, and rapidly driet, whim it bol certain that the enclozed atmonphere be
resther literally mper-heated. These are not condition ordinarily favourable to Pean. Still, $o m e$ first-rate trial have been furnished when seasons have been cool and drippy. Potator, again, do not often tarn out well; that is chiefly due, as this year, to the excessively porous natare of the soil, and to its being too highly charged with nitrogenous mbstances. A firmer soil, in which nitrogen is a minor element, and phosphate and potah are in greater proportion, is alway better for Potatos. Disease has badly raged amongat the trial Potato at Chiswick this meason, sud the growth of top is abnormal. I have found the ame reault exactly on aoil of preciaely nimilar texture, and highly charged with nitrogenous nature at Richmond, but at the anme place on poorer and atiffer moil the crop is clean and excellent. Some of the asme varieties much disesed at Chiswick have given splendid crops on poor soil in various part of Sarrey. It would be well for these two vegetable if the Council could amewhere obtain within a few milea an acre of more open and firmer soil for future trial ; that would then leave room for some other thinge of intereat to be grown at Chiswick. In both direcuion tho interestst of horiciontrare woud to greatly werved. A. D.

TOMATOB TRUE TO NAME.-Year by year the difficulty of obtaining Tomato seed true to name is becoming greater, eapecially in regard to the varietie of fine quality, viz., Hackwood Park Prolific, which I mske bold to say, from several yeara' experience in growing the ame, as also the mplendid cropa I have eeen growing elsewhere, is the fineat market grower' Tomato. 1 have at different times procared nome seeds, presumably of that variety, from the leading seedomed, but have been sadly disappointed with the reault. In one case not one plant out of a thousand or more, grown from a packet of seed, bore any resemblance to the true variety, but proved to be almost worthleas. In another inatance some 50 per cent. were true. A neighbour of mine has this eason been greatly disatiafled with seed obtained from what was considered a reliable source, Doubtless many other could a aimilar tale anfold. The variety above-mentioned wae raised by Mr. Bowerman, gardener at Hackwood Park, Baaingstoke, and it was awarded a First-clans Certificate by the Royal Horticultural Society. The btock then passed into the hande of a well-knows narsery firm, with whome name I am acquainted and, judging by the babit of the plant from a trial packet of seed receired some few weeks aince from this firm, I think they have the true variety. Another variety, also difficult to obtain true, is Trophy. At present I have a house planted with plants raised from seed from a well-known London firm; and although Trophym, there are fully half-a-dozen other varieties, inclading bad forms of Old Rad, Dadham Favourite, \&c. The 'Trophys are very good, but I would not care to asve seed from such a mixture. hold that, where seed-asving is practised, there should be but one variety grown in the house, and that true Anyone converaant with Tomato growing will know with what ease the pollen of these purious varieties on a hot dry aummer day is wafted about by carrent of air through the house-without mentioning other moans whereby it gete distributed. I asy that seedsmen cannot be too particular an to the anrce from which their tock is obtained. There is nothing more annoying than after careful and painstaking calture of a house, or houses filled with plante, to find when the fruit appeare that it is not the right thing. It is only a question of a half-a-crown or $s 0$ at the outset, but when wrong varieties are applied, and 2 in my cane, really worthlese ones, the lose involved is serions, enpecially to a market grower P. F. Le Sucur, Grand Vale. Jersey, Sept. 10.

RED.FLOWERED DENDROBIUMS. - Mr. Rolfe' remark on Dondrobiam angguineum ( $p .292$ ) lead. me to think he is not acquainted with D. arachnites. This species flowered the first time at Downaide in 1885. A dencription of the ame plant is given in Mearn. Veitch \& Sons' Orchid Manual, part iii., p. 18 It is dencribed as a remarkably beantiful and intereating Dandrobe, producing brilliant red flowers. A flower and pueudo-kulb was forwarded to Professor Reichenbach, who identified it as D. arachnites, and dencribed by him in the Gardeners' Chronicle, 1874. Profeasor Rgichenbach sent a note to the Gardeners' Chronicle, July 4, 1885, in which he maten :-" This lovely gem has waited a long time from our first nowledge of it ap to itn flowering in Eagland. It came firnt from my oldent Eaglinh correnpondent, Mr. Stuart Low, who preaented me with a giant dried flower that exceeds in nize
pither of the heven orther fowers at hand.
 from his correspondent's letter, which said the plant was very rare. Lastly, Mr. F. Sander appeared very pleased with Mr. E. Rimann, a very ardent collector and connoisseur of Dendrobia, for sending liviog and connoisseur of Dendrobia, for sending living rather jellowish honej-coloured, neatly atalked, perhape not so alwaya, as Mr. Rimann's aketch does not represent it. The flower have broad, linear, blunt, equal sepals and petale, and a much broader lip of different thape, sometimes aimple ligalate, with bavilar anglef, sometimes with a very attenaate anterior part. It is convolute. The whole flower is of a very bright cinnabar-red, the veins of the lip being partly covered with a peculiar bue. The average flowers exceed 1 inch in length. Mr. Low's flower in like the father, exceeding the present ones by a half length. Mr. E. Kimann speaks in the higheat term of it, and ach a pyramid of cinnabar fowera an he aketched them must be atriking. Of the leaven I know nothing. I wan lately mont agreeably aurprised to obtain a tine freah bulb, and a very good flower from our Orchid Cı oesus, Mr. W. Lee." Prof, Reichenbach arya, "Of the leave I know nothing;" but some time after his note appeared, he paid us a visit, and I remember the first Orchid he aaked to see was this Dendrobe in quention, when he particularly admired the new puendo-bulb and leaves-but whether he recorded any farther notes or not will, perhaps, not be known until the secreta of his great herbariam are revealed to the world. C. Woolford.

RUBT IN BEGONIAB.-I am an extensive grower of Begonims, and it is my opinion that the so-called rust mentioned by " W. K. " in your latit isue, p. 304, is cansed by neglect on the part of the growera, for I do not believe that the amall white insects are the canase of it. I am more inclined to the opinion that it is produced by fungus, induced by inaufficient ventilation, being careleas with the water-pot, and the use of atimulating manures. I have seen Gloxinias aimilarly injured. Flowers-of-alphar will be found an effective remedy if prinkled on the foliage. H.W.

VINE AT HACKTHORN HALL, LINCOLN, - In the notice of this Vine on Saturday last, the name of the gardener, Mr. William Popple, who planted the Vine twenty-five yeara ago, and to whose care it andoubtedly owes mach of ite success, was accidentally omitted. $C$.

THE ROYAL HORTICULTURAL EOCIETY AND MR. BARRON. - We are stilt in the dark as to details, but cannot rest until the Council has recognised its reaponaibility, and har made all plain to it constitaency. Perhaps we bhall leara next week that a return has been madd to the status quo ante, which might be the bent remedy for blandering- which seems to have been heavy, if only from the point of view that right was done in a wrong way. If this retarn is not made I am anxious for the fature, and wish, in the tirst place, to support "Introspecsor" in his contention that $£ 200$ a year is not a sufficient alary for a qualified man as the new Saperintendent It is not a living wage. The very least that thould be offered is $£ 250$ a year, with a house and it unual accompaniments. If the Society offers f300 (and a house), it would not be a penny more than a mitable man with a family ought properly to pend. I have no interent whatever in the appoint ment, and therefore consider it a duty to make theme remark. The right man for the post would not be well off in any case; he mat be a first-clant gardener, and a man of calture and refiaement, and muat be prepared to entertain, and could not live in a anitable manner on the alary offered. It is the duty of the Society to offer a ealary apon which a man may live without difficulty and diccomfort. I do not consider, indeed, that the kind of man for the post is really well paid with less than $£ 400$ or $£ 500$ a year, which it, perhapa, no more than that of the town aurveyor who looke after the neighbouring roads and sanitary arrangements. Many technical meaget much more, and I beg to akk why a proficient horticulturit ahould receive less than the average of other tech nical partons. I may refer, for instance, to the Telegraph Dapartment of the Pust Oflice, which I happen to light upon in Whilaker. Farther, in consideration of the future, it meems to me rah that a Council, not elected for the purpose, hould proposi the reorganisation of Chiswick. We have always underatood, rightly or wrongly, that a Conncil not qualified for dealing with Chiswick, was, necensurily, reprenented by the Chiewick board, which, however, is
well qualified. The Council need not be ahat off from all concern in dealing with Chiswick, bat it is above all things essential that qualified men alone ihould be directly responsible. I regard the Counchl, of cuure as a mixed body, or at any rate, liable to be so, and it has always appeared that a delegation of cumpetent men was anavoidable. Tais delegation due exist, in the Cbiawick board, and f1on what has tranopired it appears ntceasary to demand for it the right to primary concern and reaponaibllity in any reorganiantion that way be contemplated. If the Buard is not acrong, it can very easily be made no. This leade me to my last point-the position of the new Superintendent. We know perfectly well that even membere of the Council may not be able to recogniee the technical nature of the work to be done, and might cricicise or influeace without knowledge of the matter in hand. It is, therefore, important to ecure that the new Superintendent shail hold a ponition of unquestionable reaponability and authority, ave su the presence of a duly authorised and qualitied commitree of the Society. To the Chiswick Board he ougtit to act as Secretary, in order that he may be in close touch with that body, and be in a position to under stand and be underatood. He cannot be regarded at a mere subordinate, but mut be looked upon as a member of the Society in an eapecially responsible ponition. The head of the Chiswick garden is recenarily the chief officer of the Society in practical matter and unless this is fully recognised it is imposible that Chiswick can be managed, as it ought to be, to the full benetit of the Society, and for the good of the country. After all, he is to be hoped, the Council may retract and thus avoid an increased expenditare, which, so far an is known to anyone untaide, is quite unnecensary-unless, it be perhaps, to provide the present Superintendent with the anistance he may want. Pro bono Publico.

- The matter can hardly be left where it now atands. The pablication of the names of the opecial Council that advised the Council in thi unfortuate matter doe bat make thing wore With a few exceptions, the names repremen nothing in particalar to horticalturiats; and bad each been at weighty as that of Mr. Duuglas, it is o
infinitely more importance in a matter of this sort to know what was asid or reported than who said it, Gardenern wherever they meet are hungering to know two things-firty, the full text of the apecial report that led to Mr. Barron's reaignation; and eccond, the character of the new policy which seemed to the Council incompatible with the retention of the distingaished services of Mr. Barron The honour and the interents of the Society, an well as the wounded esprit de corps of the craft, require the production of both at the earliest ponsiblu moment. D. T. Fish, September 17.

## THE QUARRY, SHREWSBURY.

The Quarry, ae is well known to many render of the Gardeners' Chronicle, is the place wherein the Shropahire Horticultaral Society hold its great annual exhibition of plants, cat flowers, fruits, and regetables, and it would be hard to find a more witable and charming sot in which to hold a show of mach magnitude and excellence a in the Shrewnbury Floral Fa: The aite occupies a fairly central ponition in the town, and is within casy reach of the general railway tation. Nature has been very kind to the Quarry grounds, which cover an area of about 12 acres; and the Corporation of Shrewabury (to which body this pablic park belongs), backed up by the Shropahire Horticultaral Society, have mado the most of the advantages afforded by Nature, until place of very delightful and quiet resort hat been provided for the inhabitants of and vinitors to the pictaresque town of Shrewabary.
The entrance to the Quarry is close to St. Chad's Church, and is a very imposing one, there being a roomy and handsome lodge of the Qaeen Anne atyle of architecture, wibh seversl masive ornamental gilded iron gate: adjoining, and provided by the Shropahire Horticaltaral Society. Right in front of the gates is a broad straight avenue, which extend about 400 yards in lengtb, in a gradual dencent down to the broad, wiftiy-flowing waters of the windicg Sovern, and is flanked on either aide by extra fine apecimens of Lime trees (Thlia europest), which were
planted in 1720. A statue of Hercules at the ond of this avenue appears to gard the approach thereto from the river, a ferry being close by. This avenue divides the Quarry grounde, but admits of free access between the lines of trees from one side to the other at any point. Daring an exhibition that part of the grounds to the left on entering, contains the several large tents in which the horticultaral exhibite are staged, secretaries' tent, luncheon tenta, and the splendid bandstand-also we believe the generous gift of the Shropshire Horticultural Society, and the ornamental portion of The Qaarry, known as the "Dingle;" while that on the right accommodates a variety of attractions acrobatic, fireworks, \&c., with a row of refreshment tents in the background.
The "Dingle" referred to is aituate at the rear of the apace occapied by the exbibition tents, and a ahort distance from the banditand. It in a hollow of conaiderable depth, and covers about an acre in extent. One half of this apace consists of water, with a circular jet fountain in the centre, shedding its silvery spray about 9 feet above the surface of this miniature lake, in which Lilies, \&c., are luxariating. The other hall is laid out with flower-beds cut out of the grassy sward, with another fountain playing in the centre of ame. The "Dingle" is partly anclosed by trees and ahrubs, with an inner boundary composed of rough atones forming a bank of irregalar height and outline, with varions kinds of hardy plants of bushy, drooping, and trailing habit growing thereon. Well-kept gravel walks lead to and internect this charming dale-like ammer retreat.
Beds filled with golden Harry Hieover Pelargonium, intermized with variegated grass and edged with blue Lobelia, had a pleasing effect; an also had beds of "Happy Thought" Pelargoniums, edged with dwarf variegated grass and blue Lobelia intermixed, and acarlet Tropmolum edged with a good band of Bambasa Fortunei variegata, Begonias, aloo in variety, having an outer band of blue Lobelia and Golden l'yrethrum ; scarlet Pelargoniume, encircled with a band of variegated-leaved Pelargoniums; beds filled exclusively with Heliotrope and Pentstemons; and raised beds, with scarlet-llowered Begoniae, intermixed with the ailvery-leaved Dactylis elegantiesima in the middle, and having a raised band of Saxifraga dena, showed up to advantage, the coloura in the individual beds harmonising well with one another, and contrating effectively with the surrounding objects, includiag beds of Rhododendrons and Bracken. A grotto, with water trickling down among the hardy Ferna which grow out of the walla, \&ce, and a fine statue of the goddess of the Silver Lake, presented by the Earl of Bradford in 1879, are also festures of the Deil. Underneath the recambent figure of the goddens, which rested on a pedestal having three stepa accending thereto, are engraved the following lines:-

## "Sabrina fair,

Listen where thou art sitting
Under the glaney, cool, translucent wave,
In twisted braide of Lilies knitting,
The love-train of thy amber dropping hair,
Listen for dear honour's nake.
Goddens of the nilver lake,
Listen and asve."
In conclution, I should like to may a word in favour of the variety of attractions other than thome which are provided in the horticaltaral portion of the Qaarry ground for the paying pablic by the comIuittee of the Shropshire Horticaltural Society, and to which ome well-meaning people object. Fur my own part-and I have attended the Shrewabury Show pretty regularly in the capacity of jadge during the lat eight or ten years-I candidis sdait that I see nothing to object to in the practice of drawing together 40,000 or 50000 people to a flower ahor by other attraccions than thoee provided in the exhibition tente, if these are of an innocent and high-class description. On the contrary, I think, from every point of view, much good realta therefrom, and the Society in accordingly entitled to the thank not only of horticulturiats but of the general public as well, for the good which it has
done and is doing by offering liberal prize to be competed for annually, in promotisg a atandard of high cultaral skill among gardeners, amatear, and cottagers in the caltivation of plants, flowers, fruits, and vegetables, and also in promoting a love for the same subjects among the thousand of people from mining and other popalous districts, who are indaced to visit the how more from a deaire to see the variety of attractions than from any wish to see the horticaltural exhibits. These visitors, however, evince great interest in inspecting the inmates of the numerous tents, and in that way a love for and a wish to grow and tend to the requiremente of plants, flowers, \&c., is excited, perhaps for the first time, in their minds. Hence, the end more than justities the meang. Moreover, it is quite certain that were the acrobatic and aimilar attractions omitted from the Society' programme, there would be a great falling off in the annual receipts, and therefore the Sbropshire Horticultaral Society woald not be able to continue the gifte to local charities which it has hitherto contributed with auch liberality. $H . W . W$.

## Nurbery Notes

## MESSRS. LITTLE AND BALLANTYNE, CARLISLE.

As in the case of some other old firms, ownership is no longer indicated by the title of this one. The present proprietor is Mr, James Watt, by whose knowledge and energy an originally large basiness has been ntill further developed. An extensive seed trade is conducted, and beyond thil Mr. Watte is known as a farmer and atock-breeder, both in East Lothian and Camberland. The nursery at Knowefield lien on the outskirts of the ancient city of Carlisle, and contains, in addition to the enormons atock of forent trees, an interesting variety of plants of horticultural valus. Treen and shrabs, indeed all thing* pertaining to ornacoent, are grown extenaively, and the firm does a large export trade. I was struck with the posaibilities of some hardy subjects seen here in lending brilliant colour and beauty of form to the garden for which too exclusively we tarn to tender planta, requiring annual propagation and artificial heat in winter, Populus argentea, I believe a variety of P . alba, was such an one. It was planted in lines, and every individual treated as a kind of pollard by cutting it back to near the ground each year - the white foliage way decidedly ornamentel; and in contrast we obwerved the rich coloration of Acer Schwedleri, or similar red-leaved variety, the plants being treated in precisely the same manner. This idea of atilising hardy trees for the purpose of "aubtropical effect in gardening may easily be carried further. It is not generally known, for inatance, that the a atamn tints of Quercas coccinea may be used for dwarf arrangemeuts by cutting back every vear; and for handmome leaven, hardly any plant can beat Paulownis imperialis, which, if growia with aingle shoots, produces leavez 2 feet acrose each way, the shoot themselvea reaching a height of about 9 feet.

The extent of ground cultirated is nearly 200 acres, and one cannot but notice the general arrangement which seems so perfect that it would be easy, without a plan, to locate the position of every crop or particular tree. Some of the crop are exceptional in extent, and the damage done to certain kind during the past winter is suggestive of anxiety in the management of wach a concern. There is, however, the compensating advantage that plants grown here will be hardy enough for almont any district in Britain. The hardy Conifer do well, snd are trented an a specialty. Among the new kinds, a variety of the Scotel Fir, Pinas aylventris pyramidalis, is moss atriking. It has verg upright branchew, and thus emulate the habit of the Irish Yew. This, I believe, originated from seed, and, if true, it is curious that such a habit originste from seed, while the weeping habit as often originates as a bud-sport from an ordinary tree or ahrab. Record.
upon this matter would in any case ponsess interest, Among the golden Conisera Thaya occidentalin an ea was very fine, and certainly it in one of the bent. Thujopsis dolabrata does well, and therefore cold is not the something inimical which prevent it doing well in places further south. Arong apeci. men trees Pseudolarix Kæmpferi was thowing well its fine ornamental character
An interesting Conifer is Pinua Peace, which in mouth-eastern Europe represents the magaificm Pinus excelas of the Himalayas. It is demer in habit, more conical, and has aborter leaves than that species. Perbaps the most intereating of the Pinem noted was Pinus Balfouriana, of which there in bandsome tree. Ia Veitch's Manual of Conifom Plants it is said that its merits as a decorative tre have yet to be proved; aud it is of interest to remurt that this specimen was decidedly ornamental, and tufter foliage, which has origioated the namera. tail Pine, was clearly noticed. The brashet, houre, are amall.

There was a new Holly of the Hodgiasil thp called Golden King, and likely to prove an acquiition for association with its well-known conath, Silver Qaeen. As a pretty curionity, we may meation Fagus aglvatica tricolor which originated here, and has dintinct rosy colour, especially about the margina It looks like a sport from the Copper Beech, but I was not informed of its origin. Among trees of coppery tint, Betula purporea is looked apon with great favour, it being of first-rate colour. Ulmu corylifolia rubra, which should be valuable from the same point of view, was also noticed. The tre seemed to be of vigorous growth and richer in colour than the Copper Beech. Quercus robar nigre is another useful nubject in tree combination. From grave to gay, I may turn to the Rowes, which an extensively grown in all section. Reference to th houses must be brief. They contain mont plase for which there is a demand, or intereth. saw, for instance, some of the finer-gromig Conifers under glan: this method of cultur seemed to develop their beanty, and, in one or tm cases, entirely alter the out-door character of this species. $L$.

## Orghid Notes and Gleanimas

## I.ELTO CATTLEYA $\times$ BRYMERIANA (L.O $\times$ AMANDA $+\times$ C. WARSCEWICZII.

A noble inflorescence of this fine hybrid in received from Mr. Jobn Powell, gr. to W. E. Brymer, Biqn M.P., Itsington House, near Dorchenter, where the plant was raised some years ago, and where it is nol flowering for the foarth time. The rape is atcont over 1 foot in height, bearing on the apper half foo flowers on a salk, 3 inches in length. The foret in form is nearest to $\mathrm{L} . \cdot \mathrm{C} . \times$ Amanda, and in sise and colour to C. Waracewiczii (gigas). The flowen meawre 7 inches acroas; sepals and petals of bright ronj-lilac colour. Tae lip is alightiy theno lobed, and also of a ruay-lilac tint, with a bename veining of bright parple, fading off to lilac tomat the crimped margin. When matare and wim waning, the flowern ansume a decidedly blue which cansea it to appear different than is earlier atages. J. $O^{\prime} B$.

Prculiaritirs of Growth in Orcirps.
Whether it is that growern take more notict a strange growth and abnormal flower-production then formerly, or whether the lat hard winter has bean aid cause of more unusual growths in Orchids or met know not; but of late I have had many atrange met of mens aent, and questions asked as to the nint to th the abnormal pruduction. All seem to poing fact that it is difficult to define arbitrarily whas of is or what may not take place in growin the lem flower, and the more experience I obsaip inclined do I become to sBy "alway" or probitit to any feature in any plant, and eapecially an mbien Writing from Liverpool recently on this an
is producing a growth on the side of a pseadobulb, and Lycaste Skinneri with a new growth on the top of an old peeado-bulb. There appeare in the September number of The Orchid Review, middle of P. 268, referring to Catcleys labiata, 'Pseado-balbe clavate, alwaye monophyllous.' I recently parchased a plant of Cattleya labiata autumnalis, of which the following is a description. 13albs five, all of the stout, club-ihaped type, each about 7 inchen long. This year's growth is monophyllous, and bear the naual double flower-nheath. Last year's was nimilar, bat I was told that the sheath was abortive. Then come two diphyllous bulbs, both of which mpparently produced flowers, and then the first (or last) is again monophyllous. The diphyllouv bulbi are like the others, bat their leaves are horter, wider, and very thick. Perhaps some other correspondente may be able to remark on these interesting abjects."
false trade description. Mr. Tristram, for the Trades Mart Protection Areociation, prosecuted, and Mr. H. D. M. Pago defended.
Mr. Page eaid it would be now his duty to place before the magistrates his clients' defence. He took it the charge was in three heads; that there was a deacription siven wo the article sold. That the defendanter description wan false, and the faleity was in naming it shephard's Kale. The Act provided that any perzon who applied any fal-e trade description to goods, should be subject to the provisions of the Act, unless he proved that he actad without intent to defraud. A further section provided that any person who told any gorde or anything to which a falte trade description was applied, must prove that having taken all reasonable precaution against committing an offences against the Act, he had at the time of the alleged offence no reason to suspect the geauineness of the trade description. The definition given of "trade description" in the Act was as follows:-The expression "trade description" means any description taken or indication direct or indirect as to the mode of producing any goods. Mr. Page went on to deal at leagth with the $A c s$, and contended that they did not come within the definition at all. In the first place the Shephard's seed was only a variety of a aeed commonly called Kale. It was not produced by Mr. Shephard-he simply sowed the

It conteined no implication an to who grew the seed, elthough it applied to the firat introducer. They frequently bought back seeds from farmers from their own atook. Queetiono were then put as to the custom of the trade, but Mr. Triatram objected, as custom of the Trade could not override an Act of Purliament. Continuing, witneas arid he had perer heard any objection raised by a person whose pame the seed beam to the sele of seed, though not grown hy him. Part of the seed "hich was bought ifom Mr. Eidney wan mold to Mr. Harry Waters, the steward to Lord Lawrence. Siace the caso wai previously before the court be had germinated some of the seed saved by Mr, Payne from the complafnant with perfect result.
At this atage the court adjourned.
On renuming, the crose-eramination of the witnens was pro. coeded with.-In anewer to Mr. Tritram, Mr. Toogood mid be could show no catalogue of any other frm which contained mention of his seedes he would mot swear that be had ever neen one. The adrocato next proceeded to catochise the witnens in seferenoe to firms in the South of England, and as to whet her Shephard's Kule was mentioned in them. An adrestimment Was putin, in which it was atated that ell neede were grown by the firm; the witness explained that all needs bearing their

TU DISPLAY SHOWER BOUQUETS.
With a view to mimplifying thi operation, a holder or stand, the application of which in illustrated in figm. 63, 64, 65, hat been denigned and may be obtained from Meart. Oaman \& Co., 132, Commercial Street, London. Tbis patent bouquet, wreath, and cross bolder, intended for the use of florist and exhibitor, is made in brass, either folished or nickel-plated. The illantration well ahow the appliance, but we may add that the holder is trampet-ahaped, aplit, and faraished with a sliding ring, and can be expanded or contracted, or set to any magle by means of thumb-acrewa. The trampet-holder may be removed, and a hook abstitused in the case of wreathe or similar devignt. Tbe atem is telescopic, and it length in regulated by a set-screw.

## Law Notes.

## SHEPHARD $\mathbb{T}$. TOOGOOD \& SONS.

This canf, of which a brief notice wan taken from the Times, and published in these colnmas on Auguat 24, was resumed on Thursday, September 12.
At the Southampton Police Court, before Mr. G. P. Perrins aud other magistrates, Messra. Toogood Suns, inedamen, of Above Bar, were summoned for selling \$hephard's Kale by a
seed, and Nalure did the rent. Then he contended it was not false trade descrip:ion, inasmuch as it was not calculated to leceive and mislead any one as to the nature of the goods sold. Mr. Page went on to mention the witnengey he proposed to call. They included, he said, some of the best growers in the country, to whom the question was of immense importance. He also went on to contend that it was recogoised that after a seed had been placed on the market avyone was able to sell the seed, provided ho sold it by the name which had been given it. He went on to quote instances of this, and contended that the seed which was being grown by Mr. Edney was absolutely true to stock. Going on to deal with the complainant's evidence, he said the magistrates at tho last hearing must hare been struck with the very unsatisfactory way in which $h$ have bis soidence For an intligent man to stand before Rave his eridence. For an intached a meaning to shephard's Kale he could attach no meaning to Sangster's A 1 Peas was, Kale he could attach no meaning to Sangster's A 1 Peas was,
he considered, rather strainiog the credulity of the Court. He had aseumed a very strong bias, and then he had not called a single witness from the crade to support him. It was also absolute nonsense to talk about a secret process in producing the seed-it was preposterous.

The first witness called was Mr. William George Toogood. Ho said he was in partnership with his brother as soedsmen. He had had nineteen years' experience in the trade. The seed he had sold, which was now in question, was bought of M.r. Edney of Dean in March of this year. He told witness be ader perfly true in every had gone through the Kale, and it was perfectiy true in every way. The general practice of growers wad to sow vanetice of seeds in trial-grounds. In watching growth in the trialgrounde it was noticed varietiee vary, and if they noticed anythiug they approved of they selected that specimen. They sowed, and renowed the seed year by year until they considered the variety fixed. Then theseed was given a name-in many cases they preferred to give their own; it was then pleced in the catalogue and sent to farmurs and growers generilly. The name of a person attached to a seed simply indicated its Triety; there was no other inference to be drawa irom ito
nor did he know enyone who did. This whe the first year his firm had sold shephard'a Kale, and he mentioned other firm Who sold the Kale, He could not mell the article as Kale because there were about twenty-five varieties of Kale, and a farmer, when buging, would want 10 know what sort it wan. Alderman Rogers agreed with the witness, and said they must give some indication of what sort of Kale waa wanted.

Witnees would swear he had never sold Shephard's Kale by ay other name. He had once sent a packet with "Kale grown from Shephard's stock" on it, probably becavse the entleman ordered it such.
Mr. Tristrams said he had no objection to its beiag told in that way.
Crost-examination continued: Mr. Shephard had eaid he ought not to sell his Kale, but he said he had a right to do so. He bought the Kale from. Mr. Edney as Shepharo's Kale.
Re-eramined: In the firm's catalogue, a number of aeads were named with other people's names. It was a fact that bo employed farmers largely to grow seedis for him under his supervision. Shephard' Kale whe not known univerenlys it wha a purely local grow th. It wat not in other antmianne ar that account.
Mr. John Gater was next anlled. He mid he wae a farmor of Weat End, and a buyer of aeod. Noot of the varieties of seods bore the name of an individual, but tbe use of that mome was not indicative of who grew the seed in queation. II he wat sold a parcel of thephard' Kule, he thoukd not expect chey were grown by Mr. shephand.
Mr. WLliam James Vuttiag, of the firm of Mesers. Nutting A Som, Southwark Street, London, said varieties of seedm with personal name were generally quoted in all cataloguea. A catalogue of Mesarn. Hurst was produced with an entry of Nutting 's selected dark red Beet, and he said hia firm bad not supplied it direct. A man's particular seed should be sold under his name, though it need not necessarily be produced by him. The use of the personal name wall no indiration of who grew the seed under offer. It whe not his exporionce that seed grown by a pernon other than the introducer would
produce bad stock. He did not know any secret mode of producing seed.
Mr. Thomas Arthur Newby, manager to Mesars. Harat, of Houndsditch, said in reference to one of their Swedes, Hurst's Monarch, it cost $\$ 500$ to bring
was quoted in other catalogues.
Mr. J. F. Edney, a farmer of West Titherley, gave evidence to having bought seed from Mr. Shephard of the variety in question. He sold the seed, and saved some, and produced from it. Some of this he sold to Mr. Toogood as Kale seed. It was, in fact, Shephard's Kale seed.
Mr. Page intimated that he had other witnesses, but would rot call them, and the magistrates retired to consider their decision at ten minutes past four. Sir minutes later the Chairman said the magistrates were unanimous in dismissing the summons with costa, after having considered the matter very fully.
In answer to Mr. Page, the Chairman said they meant the whole of the costr, but these being left to the Court, they Mr. Tristram applied for leave to state a oase, which was granted.

## SOCIETIES.

## BATTLE HORTICULTURAL.

September 4.-Favoured by magnificent weather and a picturenque location, the annual show of the Battle Floral and Horticultural Society was a great anccess. Most pontponed events suffer, bat though pat off a week on account of the Hantings Carnival, the indefatigable Hon. Sec. and committee must be heartily congratalated on the display made in the three large marquees provided, inclading over 1000 entries.
Potatos were prosent in profusion, and were almost without exception of very high quality. Onions were, as al
rule, deficient in finish, but root crops were clean and good all rule, de
In the first division, Mr. T. Portnell, gr. to Sir Archibald Lumb, Bt., was well to the fore for gix stove and greenhoase plants; and he had also six very clean and good foliage plants. Begonias were not good, and Fuchaias, with the exception of one lot, were badly bloomed. Zonal Pelargoniums were fairly well shown, but they are not ejual to the heavily-flowered apecimens one meets with on the $\mathbf{F}$. and 8. E. coasts. Altogether, the plants in divisions 1 and 2 were not so good or so
numerous as in past years. Cat flowers were in plentr, but if numerous as in past years. Cat flowers were in plentr, but if
we except the stove and greenhouse blooms staged by Mr. T. Portnell, and the decorative Dahlias of Mr. Stredwrck, they were not worthy of special notice. Roses were good and bright for so late a season, Mr. T. Durrant Young, Eastbourne, making the beat show; While the amateur honours fell to Mr. H. Foster. of Ashford, in both divisions. Gladiolus d.CHIVERS, st. Leonards, won for Phlox Drummondi.

Fruit was in grand condition, and the eatries were numerous. Mr. W. Allan, gr. to Lord Brassex, took both lst prizes for a collection of eight dishes, given by Col. Hankex, Beaulien, as well as a thoroughly well-deserved 1st, for three bunches of Muscat of Alexandria Grapes and three bunches of Black Hawiburghs. Three bunches of Black Bamburgh Grapes, thown by an amateur, W. C. Raper, Esq, were perfection in aize, colour, and finieh; while market grower, Mr. Y. Gore, secured a good ist for three bunches of Gros Maroc.
Melons were numerous, but a trifle over-ripe. Mr. Portrell secured lst prize with Blenheim Orange.
Ia Apploe, Mr. W. Allier took list. with lady sudeley (dessert variety), and Peaugood's Nonsuch (eulinary), both of which ware handsome dishes.
The mont tempting fenture in the frait classes was, however, the Plums, which were highly coloured and finished;
indeed, I have rarely seen Gages so good. lat, Mr. E. P. indeed, I have rarely seen Gages so good. lat, Mr. E. P.
Edwards, gr. to the Hon. F. A. Brassey; 2nd, Mr. T. Ed wards, ${ }^{\text {gr. }}$ to the Hon. F. A. Brassey; 2nd, Mr. T.
Portakli; 3rd, Mr. Gower, gr. to Mrw. Lawreace. Whilo nin amataur, B. H. Thonpe, Eleq., took let with Tranaparent olam with Pond'u Eeeding, all crown on open wall, and perfeet in colour and fraish.
Local and othor floriate made a good display in planta, Ferns, and cut flowersof hardy porennials. Twogroups arranged by Mr. Hollands and Mr. Charlitor respectively, of Tunnovelties, the former showing good Ferns and Caladiums, novelte some pans of the pretty sibthorpia europeaa variegata, were conspicuoualy well-coloured and healthy. Mr. CHARL TUN had a hybrid Statice (latifolia $x$ incana) of elegant habit, with small blue flowers, most useful for cutting; some good hybrid Montbretias and Rudbeckia tomentosa. T. Bunyard.

## ROYAL CAIEDONIAN HORTICULTURAL.

Sircmank 11, 12.-The autamy show of this Society was held in the Waverley Market, Ediaburgh, on the above daten. Probably few more auccenaful thow: have been held under the auspices of
the Society. The number of entries was over 2100 , and of thene the majority were good in quality. Frait and cut flowern embraced tho mont claves, and particalarly in thowe devoted to Graper and Applen, the
entries were very numeron, and the exhibits remarkably good. The collections of Gladiolus and taberous Begoniaw were brilliant in colour, the former never having been aeen in finer condition in Edinburgh. In the vegetable clanes, the competition was generally keen. Nurserymen from all parts were present, and their exhibits did much to give the place an additional gay and furnished appearance.

## Plants.

The plants arranged for effect upon tab'es were deserving of praise. That arranged by the winner of the lst prize and
Turner Memorial Cup, Mr. G. Wood, gro, Oswald House, Turner Memorial Cup, Mr. G. Wood, gro, Oswald House,
Edinburgh, was an excellent arrangement. Upon his table were noted Oncidium incurvum, Odontogloseunas, grasses, Palm, Crotons, and other decorative plants and Ferns. The 2nd prize went to Mr. J. Mc
In the class for four stove and greenhouse plants in flower, the plants were small generally. Mr. J. McIntyre was 1st, and included plants of Lapageria rosea and Statice profusa; 2nd, Mr. W. BENMETT, Corstorphine. Mr. W. McMurtrie, gr. to Sir Ed. Colebrooke, Bart., Abington House, was lst for a single specimen stove o
flowered Statice profuss,
flowered Statice profusa,
Orchids were few, and the plants gonerally small. For four Arundel House, Dumfries, toon lit prize with Odontoglossum grande, O. Harryanum, Cattleya Dowiana, and C. Eldorado; Mr. W. Hutchinson, Balmedie, Aberdeen, was a close 2nd, with Dendrobium Phalænopsis, Disa grandifora, Cypripedium Spicerianum, and Cattleya Dowiana. A magnificent plant of Oncidium incurvum, with more than twenty spikes of expanded flowers, from M
In the class for Cypripediums, Mr. W. SHanP was 1st, with good plants of C. Schroderianam, C. Harrisianum superbam, and C. cenanthum superbum.
For foliage plants, Ms. T. LunT, Keir Gardens, Dunblane, took the premier position with splendidly-grown plants, Ciseus disco'or, Alocasia metallica, Anthurium crystallinum were especially good. Mr. A. Urquilart. Liberton, was 2nd, with smaller but creditable plants. The best Crotons in the class for two came from Mr. T. Lunt; 2nd, Mr. J. MoLrtyre, Darlington. Table plants were numerous, and lined the raised centres of the fruit tables. Mr. M. McIntyre, gr. to Sir O. Tewnswt, The Glen, Innerioithen, taking lat prize.
Tuberous Begonias were generally good, those coming from Mr. A. R. Hendereon, gr. to W. Micfie, Rsq.. Clermiston, baing far beyond the rest in quality and size of bloom. Is the elase for nix, Mr. D. ADAMS, Duddingston Cottage, was 2ad. Mr. A. Brypon, Tweedbank, Innerleithen, was 1st for a specimen double Begonis, exhibiting a deep salmon-coloured Farietg.
Fuchsias were good. Mr. A. Pryce, Newington House, was 1st for two; and Mr. W. Attken for a single specimen.
Pelargoniums creating a blaze of colour, Liliums and other flowering plants occupied considerable space, the early-flowered Chrysanthemums being fiirly numerous.

## Ferns.

The prizes for Ferns were well competed for, as ukull. Mr. Napier, gro to P. N. Fraser, Eeq. Murrayfield, was a saccessful exhibitor in the larger classes Mr. A. Urqueart, Southfield, Liberton, being 2ad to that exbibitor for four diatinct exotic kinds. Mr. NAPIER and Mr. J. Nairn, Craigcrook, took 1st and 2nd places for four Adiantums, both exhibiting good plants. With a splendid A Ciantum Farlegense, Mr. D. McMurtrie, Abington House, was 1st. Mr. Nıpier was succeasful in the class for nine distinct British Ferns, the classes for these being well contested.

## Cut Flowers.

Tho fine apires of Gladiolus staged by Mr. Smite, Prestwick, were the admiration of all, his blooms were of large size and very brilliant in colour. This exhibitor was lst in the classes for twelve, and for six spikes. Hollyhocks were well shown by Mr. A. Oliver, gr., Cresswell Hall, Morpeth, who was lat for twelve magnificent blooms, and also for five spikes. Judging from the number of Dahlias of all sections shown the season han beon suitable for them. The 1st prize for twelve show blooms was gained by Mr. W. Craig, Duns, for a very even lot of heavy subatance and perfect thape; followed by Mr. W. Veitci, of Carlisle, the latter taking let place for six show bloome, and also in the class for twelve fancy bloom?
The best Dahlias in the class for six trusses, single blooms, came from Mr. J. PEARsox. Murrayfield, who also secured 1st place for dix bunches of single Cactus Dablia blooms.
Sweet Peas were shown in abundance and great variety. In the clase for six bunches, Mr. A. Berpor, Innerleithen, was Ist.
For twelve trusee of stove or greenhouse flowers, Mr. W. SHarp, Forgandenny, and Mr. M. MaImtybe, The Glen, Innerleithen, took 1st and and places respectively.
Carnations and Picotses, Pansies and Violas, brought many entries, and the winaing lots were of first-class quality.
Chrysanthemums in bunches and single flowers were fairly good. Mr. J. Napter being let in the bunched claws, aud Mr. 4. Brypon securing that position in the cluses for the twelve and ais varieties.
Mr. Low. Dundee, was ist for well-arranged hand bouquets among fifteon sompetitorn.
Roses.-The exhibits in these clanes required a considorable epace, and were in most case3 good. The best twenty four distinct varieties were from Mr. W. Harper gr. to J. Rrchindson,
Esq.o Parth, conspicuous apon his board wore Ulrich Brunner
R. Jacobs, A. K. Williams, Grace Darling, General Jaoquaminot, and Cloire de Margottin ; Mr. W. Parlane, Romiee,
2nd. In the class for twelve blooma, there were secenten entries, Mr. J. Hood, Helensburgh, securing 1st place Tes Roses were numerous also, and the classes devoted to separate rarieties brought some good blooms. In the clames for is blooms, each of Charles Lefebrre and La: Tranoe, Mr. Hood Herba
Herbaceous Cut Blooms, -The class for twelve barejee od herbaceous flowers had numerous entries, and Mr. J. Murku,
Bridge of Weir, was placed 1 st for a fine selection.

## Frut.

Ninety-six classes were devoted to fruit, and as there were a great number of entries in some of the clasess, the gnod display may be easily inagined. The prizes for the colloction of twelve dishes of fruit, exclusive of Pines and Baname prosented
competitors, the list prize going to Mr.W. SMrTH, gr.. Ovem competitors, the lst prize going to Mr. W. Smrit, gr.. Oxem fruits of very exceptional quality; the 2ad prize was gaind by Mr. J. Hunter, gr.. Lambton Castle; while Mr. D. eight dishes also contained some excellent fruit Hunter was 1st, and Mr. W. Smity 2nd. For twelve didian of hardy frait, grown out-of-doors, Mr. S. T. Wrigirl, of Hereford, was 1st, and Me. J. DAY, Garlieston, 2nd. Mf, J. Hunter carried off the lst prize for twelve dishes of orchand house fruits (Grapse excluded).
The best sir buaches of Grapes, three varieties, came from BuCHAYAY, Kippen, who also staged some by Massa, D. \& W. For two bunches of Muscat of Alexandria, Mr. D. Kidd, Car. berry Towers, was lst, with well-fiaished fruit. The lst priza for two bunches of Black Haraburgh Grapes went to Mr. J. Potter, Cumberland; 2nd, Mr. J. Menzies, Larbert, both of whose exhibits were very fine. There were eight competitern
in this class. An enormous bunch of Black Alicante Grapes with fine terries, well finished, and carrging a good bloom, secured Mr. T. Boyd, gro, Callender Parly, Falkirk, the lit place, the bunch weighing about 10 lb . Mr. T. Boyd was aleo lat for one bunch of Laty Downe's, and was followed by M. t. Lunt.

Mr. M. McIntyre, Inaerleithen, was 1st in the clase for one bunch of Grapes with fiaest bloom, showing Oooper's Black. Mr. T. Boyd was lat for a Queen Pineapple of not lem than 3 l lb . weight ; 2nd, Mr. McIntyre, who carried off the priz for any other variety not less than 5 lb . in weight, with a good smooth Cayenne. For the best green-fleshed Melon, Mr. T. Boyd was lst with a medium-sized fruit. Mr. J. Morrisor. gro, Archerfield, secured lat place both for twelve Peaches and for the same number of Figto
Apples required the space affo ded by several tables. Mr. S. T. Wright, Hereford, being the most succasaful exhibtion, taking fourteen lat prizes out of the thirty-three classes. The fruit was, gonerally speaking, large. though hardiy rips.
Peus were not so numerously $h$ hwn as Applea, but nowe very fine fruit was staged. Mr. J. Gibsox, Chiswiek, and Mr. S. T. Wrient, sharing many of the prizes between thm. Some very fine red and white Curran'a were staged, add the entries for these classes were numerous.

## egetables.

Of the five competitors who staged collections, Mr. J. Ginsor, Devonhurst, Chiswick, was 1st, and was awarded the Xedi of the Veitch Memorial Trustees. Mr. B. RAE came 2 ed with creditable collection.
For two Cucumbers, Mr. P. MaIn, Polmont, wam ist, alico for twelve Tomatoo. Cauliflowers were best shown by kr, J. Lorraine, Lasowade. Mr. J. Cossar, Dunbar, stagod the best twelve rarieties of Potatos. Parsnips, Turaips, an Onions brought a large number of competitors. Indoedted.
clasee for vegetables all round were most eagerly conterta

## Nurserymen's Classes.

Messrn. R. B. Laikp \& Eons, Messrs. Diotsor © Co, of Edinburgh, and Measrs. J. \& B. Thymne ware the ony exhibitors of plants, the formar securiag three lat and pirsen 2ad prizes out of the six classes. For thirty Gladiolas single
 2nd. Out ot the thirween classes for cut Rose3, Mosera, sh Cooker \& Sons, Aberdeen, took ton 1ut prizes, ineludiag claseos for thirty-six and eighteen. Messrs. T. SMITH $\&$ nwion Stanraer, are to be commended for their stand of buifuat which took the lat place, upon which some madeo wow also sums were noted. Messrs. D. a W. Cromicizes for tradme also successiul Rose exhibitors, taking $19 t$ prizes of chate
blooms of Merveille de Lyon, and for twotve blooms blooms of Merveille de Lyou, and for twalve Clarysanthemet Lefebvre. For twenty-four trusses of Chrysanthem Mesars. Dickson \& Co. Were sucsesful;
and Picoteos, Mr. W. CampBell was lot.
Miscellaneous Exiibits were numerous. Mesars. B. B. LATRD \& SoN arranged a pretty table of stove and greomes plants. Messrs. Metaven \& Son were conspicaont Begonias, Clematis, Liliumas, and other flowaring pham fine table of highly-coleured foliage plants came frow macian J. \& R. Thymer, of Glasgow, which were very mired. The tables of Ferns. including relief after the biaze of cut flowers, and Mesars. BiBIESHID \& Sor are to be congratulated upon the good drs. J. Herbaceous and floriste' flowers came from Mesirs, \& Sons, from Mesars. Dobbie \& Co., and Mesers
son, Rothesay, the tables of each being centros of attur in grin

A very tempting table of Grapes, arranged with coloured Vine foliage, came from Mesers. D. \& W. BCCEINAN, Forth rinegards, near Stirling, and was much admired.
Many other exhibita received their full share of attention from the large number of visitors who were present at all tiveso during the hours when the exhibition was accessible to the public.

## FUNGUS FORAY AT HUDDERSFIELD:

llundrrafield was selected by the mpcological ection of the Yorkbire Nataraliata' Uaion as the hearquarters of the 1895 Fungus Foray. On Saturday, Monday, and Tuenday, September 7, 9 and 10, a serce: of meetinge and excursions were held. The chief object of the meetinge was the inventigation of the wooda and paature in the neighbourhood of Hudderatield for fangi.
The party included Dr. M. C. Cooke, M.A., A.L.S., of London; Mr. George Masee, F.R.M.S., F.L.S., of the Royal Rerberium, Kew; Mr. Carleton Rea, M.A., B.C.L., of Worcester; the Rev. W. Fowler, M.A., Liversedge; A. Clarke and J. Suteljff, of Huddersfield; A. Bairstow, C. Crossland (hon. sec.). H. T. Soppett, J. W. Sutcliffe, of Halifax ; and J. Needham, of Hebjon Bridge. Satarday's excureion was to West Wood, Honloy, and Storthea Fiall Wood, under the leadership of Mr. A. Clarke. Although fungi were acarce objocts, a few interesting specimens were found. Fixby woods and pastures, the hunting ground of James Bolton, a famous Halifax botanist, one of the pioneers of the study of English fungi, and who flourished during the latter part of last century, were al:o vivited, and here also a few interesting species were found.
Monday's excarsion wat by train to Hebden Bridge, thence by convegance to the delightial woods of the Hebjen Valley. This was under the leadership of Mr. James Needham and the secretary. As in the previous oxcursions, fungi were by no moans plontiful, but amongst those collected were two good finda, viz., Paxillus paradozus and Boletus nanus, which hitnerto had not been found in West Yorkshire. The specimens collected in the aggregate amounted to upwards of 200 different kinds, among which were many interesting forms.
Meetings were teld each eveninge at the Y.M.O.A. rooms, t which place the specimens collected were determined and placed on exhibition. Consignments of fungi were sent in by the neighbouring societies from their respective districts. Not the least interesting part of the programme were the lectures delivered by Mr. Maseee, on the Saturday and Monday eveningo, which were illustrated, by well-prepared lantern slides, showing the structure and development of a variety of fungi that are deptructive to cultivated plants, and methods were deacribed for checking their devastations.

## Trade Notice.

MK. JAS. GRIEVE.
Many readern of the Gardeners' Chronicle will be pleased to learn that Mr. Jame Grieve, for many jeara nareery manager to Mesers. Dickson \& Co., Edinbargh (who have been compelled to remove their whole nureery basines to Liberton, owing to a large portion of their ground being required for railway purposes), has retained part of the Redbraes Narsery, where he will, in company with two of his mon, carry on a general nursery and florist business, nuder the name of James Grieve \& Sons. It in Mr. Grieve's intention to devote a large proportion of his time to hardy florist's flowera, with the raising of to many of which, enpecially Pantien and Violae, his name is so intimately connected.

## Obituary.

James Harris. - We regret to hear of the denth of Mr. Jamen Harris, which took place on Auguat 29, after a short and severe illness, at the Gardens, Torrance Cantle, East Kilbride, Lanarkahire, the residence of Colonel Harringion Stewart. Mr. Harria was well known as a good Rose grower, a clas of plants he took a great interent in, and of tuberona-rooted Begonias, of which he had got rogether one of the finent collections in the went of Scotland. The deceased was in his fifty-ninth year, and leaver a fridow, one daughter, and eight mons, to rooura his loss. I may mention the fact that two of his wons hold responsible positions, one at Carator of the Chincons Botanic Garden, Jamaica, and aoother as chief of the Orchid department of Mesers. J. Veitch' Narsery at Chelsea. W. Camm.

Dictionnaire Patatique d'Horticulture." -This has now reached its fortieth part, down to the lettere Mu. We have mo often spoken in appreciative terms of this publication, that we need not repeat what we have said, bat congratulate M. Mottiep on the regular progress of his laborious andertaking. The pablither is 0 . Dons, 8 , Place de l'Odeon, Paria,

## THIPASTWEEE

Ten following summary record of the weather throughout the British Islands for the week ending September 14, is furnished from the Meteorological Office:-
"The weather, as a whole, was again fine and dry over the greater part of the Kiagdom, although rain was experienced in nearly all places on the loth or 11 th. In the exrreme north of Scotland the conditions remained unsettled, and rain fell almoet daily. Severe thunderstorms occurred in some parts of Scotland on the 9 th.

- The temperature again exceeded the mean, the excess ranging from $2^{\circ}$ in "England, E, and Ireland, 8." to $4^{\circ}$ in ' Scotland. W:' The highest of the maxima were recorded on the 9th, when the thermometer rose to $87^{\circ}$ in "England, S.W.' (at Llandovery), $88^{\circ}$ in the "Channel Islandn,' $84^{\circ}$ in S.W.' (at Llandovery), $88^{\circ}$ in the "Channel Ialande' $84^{\circ}$ in "England, N.W." $83^{\circ}$ in "England, S." and to $82^{\circ}$ in the 'Midland Counties.' The lowest of the minima, which occurred on the 13th, ranged from $37^{\circ}$ in the "Midland
Counties," and $38^{\circ}$ in "England, 8 . to $45^{\circ}$ in "Scotland, W. Counties,' and $38^{\circ}$ in 'England, 8 . to $45^{\circ}$ in "Scotland,
and England, N.W.,' and to $45^{\circ}$ in the "Chennel Islands."
"The rainfall just equalled the mean in 'Scotland, No, but was Ieas in all other districts. Over ' England and Ireland, S. the fall was very slight.

The bright sunshine was rather deficient in "Iraland, IN aud Scothand, $\mathbb{N}$." but was again very prevalent in all other diatricti. The percentage of the possible duration ranged trom to 35 in 'England, N.W.'' 22 in "Ireland, N.,' and 20 in - Scotland,

## MARKET8

London: Sept. 18. - Meears. John Shaw Sons, Seed Merchanta, of Great Maze Pond, Borough, Tondon, S.E., stste that business in field Seeds continues on a narrow eeale. Trifolium is in diminishing request, quotations for fine wmples are now abnormally low. Winter Tares come forward more freely, the demand being small, values naturally favour buyers. Sowing Rye is also axceedingly cheap. The new white Mustard is proving rather a short crop. Rape-weed is depressed. Birdseeds are for the moment in mengre requeat. There is no change in cither Peas or Haricots.

## FRUITS AND VEGETABLES.

Londor Averages: Sept. 18.-8nowdrope, b0s. to 80s.; Hebrons, 60 s , to 80 s . ; Imperators, 50 s . to 00 s .; Puritans, 50 s . to 55 s. ; Rarly Rose, 55 s . to 60 s. ; Regents, 55 s . to $65 s_{0}$; Magnums, 403. to 55s. por ton.

## CORN.

Averages. - Official statement of the average prices of British Oorn, imperial measure (qr.), for the week ending September 14, and for the corresponding period in last year:1895: Wheat, 22s. 10d.; Rarley, 23s. 11d.; Oats, 13s. $8 d$. 1894: Wheat, 20s. $5 \mathrm{ch}_{0}$ : Barley, 23s. $9 \mathrm{~d}_{\mathrm{o}}$; Oatt, 15s. 9 d.

## HAY.

Averages.-The following are the averages of prices at the principal metropolitan markets during the past week:Clover, prime, 90 s . to 110 s .; do., inferior, 50 s . to 80 s. ; hay, beat, 60 s . to 90 s .; do., inferior, 80s. to 68 s. ; mixture, 70 s , to 923. ; and Straw, 20s. to 38s. per lond.

- Fowing to the large increase in our circulation, toe ar Felvictantly under tha necessity of going to press some hours kindly aid us by sending their communications as sarly in the weet as possible. Communications should reach us not loter than Wednesday.
* Plants, Feutre, ETC., to ne Named.-Correspondents sending plants or fruits to be namad, or asking questions demanding time and resateh for thelr solution, must not sopect to obtain an anower to their omquiries in the curront wosk. Speimens thould be good ones, earsfully packed and numbored, and wot more than side should be sent at ons time. Leaves only, of Foricts varieties oanmot, au a rule, be named.
Akalysis of Soil: Thos. Bury. You could obtain an analyais from the Agricultaral College at Dowaton, Wilte, on paymeat of a small sum.
Appie Serdeisa: M.B. The Apples you send us are of cood size and appearance, and may prove to be a good ueefal sort. It is too early at present to pass a deanitito opinion. We would recommend you to send six fraite to the Frait Committee of the Rogal Horticaltural Society for their opinion next jear.
Brgonia Livares Dremequan: 4 Constant Subeoriber. Before your question can be answered, you mast nend us some of the creatures which canve the injury to the leavea. Probably, they are some apecies of alug which are night feedere generally, and mast be looked for after dark.
Boons: W. H. M. Fruit Farming for Profit, by G. Buayard; pablished by F. Banyard, 29, Woek Street, Maidstone; Praotical Fruit Culture, by J. Coeal; pablithed by G. Bell \& Sons, York Street, Covent Garden.-F. White. My Gardener, by H. W. Ward, pablished by Egre \& Spottiawoode, Eaat Harding Street, E C.-Amateur. The serial works on Orchide in the Eaglish language, now bring inuued, are The Orchid $\mathbf{A l h u m}$, by B. S. Williame \&s Son, Paradise and Victoria Narseries, Upper Holloway, N. Monthly parte, price 5s, It has been ranning since 1881 ; The Orehid Reviero, monthly, price 1s. Communications should be Creacent to the aditor of the Orchid Revievo, Lawn Creacent, Kew; Lindenia, conducted by Mearrs. J. Lindmn, Lucien Linden, and E. Rodigay ; publistied py Eag. Vanderhaegen, Ghent; Reichenbachia, Rabseder. The Fonder \& Co., Sb. Albanna, Reseder: The Horticultural Handbook and Fo hibitoro' Guid, new edision (W. Blackwood \& Sone, Edinburgh and London).

Cinsrarias: Interested. Perhaps the moil is infented with the grab of a weevil very deatractive to Cinerariae and most other thinga. Can you send us some of the grabs you have seen?
Crabs: J. Backhouse \& Sons. The Crab received from the late Dr. Regel, and again sent to ut, is a variety of Prunus Malus pranifolia, see Gardeners Chronicle, p. 427, October 2, 1886. The Crab John Downie, fraits of which you kindly send us, is a very ornamental variety, either in flower or frait, the latter fact being well sho wn by the fruits sent.
Duroline: P. M. We should greatly doubt the anitability of this material for covering a vinery inatead of glass ; but as a wall protector entirely open in the front, it would answer admirably.
Grapes: Gardener. Not having the least knowledge of the circumatances under which your Muscat Grapes are cultivated, we shall not presume to atate in what respect your calture is deficient. It may be anid, however, that shanking naually indicaten that the border is in an unsatisfactory condition, that the roota have penetrated a wet anbsoil below the border, or that too much water has been given the Vinem.-W. L. You may be right. We have aeen instancen before where the colour in Grapes has been affected by the stock on which the variety has been grafted. In this case, however, we take the colour to be merely a slight disfigurement by ruat from cold draught, eapecially as the exposed parts of the berries are alone discoloared.
Hecrbrbry: W. A. Prunua Padua, Bird Cherry
Hippeastrime: Amatour. Sapponing that the bulb: have been growing under glass all the aummer, growth will soon cease altogether, when water should be gradually withheld until the leaves turn of a yellow colour, when no more thould be afforded. Some varietien are almost evergreen in habit, but these should be similarly treated. It the plante have completed their growth, pianged to the rim of the pot in a mild hotbed, the roote will have penetrated the aubutance of the bed, whother it conolitt of tanner's bark, Oak leaven, or cocon-fibre refuse above a heated chamber They may be partially lifted out of it when the leaves have turned yellow. The temperatare of the house should not exceed $45^{\circ}$ in the winter. Failing the accommodation this mode of culture demands, the dried-off balba may be kept in their pots in a frost-proof dry room, or on a shelf in a vinery or greenhouse. The repotting may commence in January, and should be completed by the middle of the next month for all balbe of flowering age, and that of young non-flowering balbe by the end of March-of course the earlier the better, $s 0$ that the planta may have the benefit of a long season of growth. Seedlinge whose balbs are not larger than a aparrow's egg must not be dried off, although the quantity ot water required will be very amall from October to January. Bulbu purchaved at the shops may be either potted when bought, or kept in annd or cocoa-nat fibre till the proper time for atarting the balbs arrives.
Names of Fruits: (see notios under Names of Plants), W. T. Pear Belle de Bruxelles.-W. S. L. 1, Styrian ; 2, Marie Lonise ; the Apple is Hormead' Pearmain.-W. Cann. 1, Ronemary Rusest; 2, Cox's Orange Pippin; Pium much braived, may probably bo Pond's Seedling.-J. G. 1, Stone's Apple; 2. a pale frait of Dachess of Oldenbargh ; 4, Pear Marie Louise ; Plums ehould not have been packed with Apples.-T. W. Wo can only undertake to name six fraitent a time; Pearn, 1 and
 Louise Bonne ; 5, 5i, D, Doyenné Bjussoch; Apples, 2, Blonheim Orange; 4, Keswick Codlia.-T. Y. 1, Worcester Pearmain; 2, Maltster; 3, Dachess of Oldenbargh; 4, Lord Saffield; 5, Peaagooi's Nonsuch; 6 Datch Codlin.-W. S. Tighe. 1, Worcester Pippin; 2. Dacheas of Oldeaburgh; 3. Autumn Pearmain; 4. Cox'a Pomona; 5, Worcester Pearmain: 6, Gloria Mundi.-W. ${ }^{\text {Co }}$ Apple, Gladetone ; Damsons, the Farleigh variety.
Names of Plants: Correspondents not answered in this issus are requested to consult the next number.$J . M c D$. A Zggopetalum. The flower wan destroyed by a slug in the moss:-A. S. Veronica Chamædrys ; distorted by an insect. N. C. Polygonum cuopidatam.-H, W, R. Two billing received for Gardeners' Orphan Fuad with thanks. 1, Acalypha Macafenians: 2, Polygonum cuspidatum, -J. T. P. Celaia arctarus.-T. W. $B_{\text {。 }}$ Solidago canadenvis, Golden Rod. - H. T. Cytha-
rexylum betonianum.-F. Herrington. ${ }^{*}$ Polygonum caspidatam.-A, M. 1, Leycenteria formona ; 2 , Pinus Sabiniana; 3, Tilia earopea laciniata (the cut-leaved Lime), -H. B. Oncidium ochthoder, which is asid to be the same as O . chrysornit of Reich. f.-Elmet, Leeds. The Odontoglosnum Uro Skinneri is quite equal in every respect to thom we have remarked on, though differing from either.-Woollsey. 1, Polygonum caspidatum; Hieracium aurantiacam; 3, Pteris argyraa; 4 Adiantum concinnum latam; 5, Adiantam decoram; 6, Polypodium crassifoliam; 7, Pterin tremala.-C. B., Monmouth. Polygonum capi. datum.-N. C. 1, Capsella buras-pattorin; 2 Stellaria media; 3, Eaphorbia sp., probably peplau, -Camoens. Send better specimen.

Oaf gall and Oak apple: Royal. The termare synonymous.
Peach-shoots: Gardener. There appeare to bo nothing the matter with your Peach-shooth, bus the leaves are infested to some extent with amull acale, and probably red-apider. Syringe them rell daily until the leaves begin to fall off, and then the trees can be thoroughly cleaned before they are started again. Keep your hou*e open night and day, and use no fire-heat.

Roses, Mushboom Spawn, \&cc.: Grower for Market We cannot recommend dealers. Why do you not advertise your requiremente, or acsa our adrertinement columns?
Walnuts: C. C. Keep the nats, after the shell have been dried in the thade spread out on ant or table, in dry salt, clesn silver-sand, or charcouldust, and atore in a cool cellar. The nuta will not keep more than four montha in good condition.

Watrb Lettoce, \&c.: N. C. Water Lettuce in it Went Indian name given to Pistia atratioted, a very common tropical water-weed, which pro pagates iteelf with auch rapidity, that it frequently covers tropical ponds with its foliage, It ruy easily be grown in water-tanks in warm-houset in this conntry. The plant floats on the water, and senda down into the same a mase of fine roots. The leaves are sometimes 5 inches long, prodaced io tuft, and runners are very freely produced from each plant. The Treasury of Botany mould be useful to you, as it contains intereating partienass about this and many other plants you aro interested in. Hyptis suaveolens is known as hiol Weat Indian Spikenard; Ferula Ansfosidid F. galbonifera, and F. orientalis, are not gaviden plante, though in their Mediterranean homes ens is of economic value. You masy experiena difficalty in obtaining the plante unless through botanic garden.

## MAN'S INGRATITUDE.-We have it on

 Shakeapeare's anthority that the winter wind is notunkind than man's ingratitude. In many cases this is more unkind thas man's ingratitude. In many cases this is
unfortunately ouly too true. There are times, however, when unfortunately only too true. There are times, however, when the benent received is is great that ingratitade becomes and someone comes and reatores us to health, we should be base indeed to feel ungrateful. Thus, millions are to-day greteful to HOLLOWAY'S PILLS AND OINTMENT, whach have cured them of all stomach and liver troubles, banished headache flatuleacy, indigestion, and low spirite, and oleared their systems of gont, sheumatiem, wistica, and all similar silments.

BY SPECIAL APPOINTMENT TO H.R.H. THE PRINCE OF WALES.

## THE

## Gardenters Chronidle.

SATURDAY, SEPTEMBER 28, 1895.

SOME OLD-WORLD GARDENS. THERE is an indescribable oharm about oldfashioned gardens, which in modern ones seems to be lacking. The piotures are toned with a mellow restfulness, soothing and grateful to the townsman's nerves. "Fair quiet and sweet rest" are there, no violent contrasts of crude colours, scarlet, yellow, or blue, distract the eye : mingled fragranoes pervade and pleasant memories linger around them. From this old mossy-stemmed Apple-tree, onoe again drooping with it wreaths of crimson and gold, we gathered a pooket full of luscious fruit full sixty years ago. The goldfinch still puts her pretty nest in the boughs overhead. From that old China Rose we plucked a bud, and put with it a spray of Ladslove to offer to a blushing lassie of sweet seventeen !
All the year round, too, there is sometbing to admire in these old gardens, from Snowdrops and Winter Aconite, Crocus, and the "rathe " Primrose; through the freshness and beanty of April and May, to the time of Roses in leafy June, when the garden is in its prime, Pinks and Lilies are there, with Ronemary, Ladalove, and Lavender. Then comes the waning year when-

## "Heavily hange the Hollyhock, <br> Heavily hange the 'Tiger-Lily.'

Perhaps it is during August and September that the flower-garden wears its most resplendent colours, and when butterflies san their gorgeous wings on the petals of the Phlox, the Hydrangea, and the Aster.
There are few lovers of a garden, and worthy of the name of amateur, who will begradge the gardenless visitor a glimpse of his flowers.

Let me endeavour to give a brief sketoh of some gardens whioh, by the courtesy of the owners, I have been allowed from time to time to saunter through. There is one garden, by the way, accessible to the public, as of course it should be-they pay for ita keeping-Royal Kew, perhaps the grandest garden in Europe! But I speak of others not so well known.

One of the most delightfal old gardens in England is that of Lord Essex at Cassiobury Park, near Watford. These gardens were repeatedly visited by John Evelyn, and about them Stephen Switzer remark: "It must not be parsed by that at Cassiobury the pollte spivit of gardening shone brightest," and that he "never saw that traly delightful plave without being more than ever ravished by its natural beauties." Entering from the woodlands by the headgardener's cottage, beneath a leaf-fringed aroh in the lichen-stained wall, we see a portion of the old kitchen garden. In front of us is a border about s hundred yards long and three yards wide. On either side of it is a broad, smooth, gravel walk; and along the centre, atintervals of perhaps half-a-soore yards, is a line of standard, domeshaped Filberts. On either margin is a belt of
white-flowered Pinks, 2 feet wide ; then the centre -nearly 5 feet across-is entirely filled with Lily of the Valley, Lilies, and Pinks. One may imagine the perfume exhaled as the spring showers patter among the leaves and blossoms.
One of the paths is over-arched by Apple, Pear, and Plum trees. When I saw it the trees were loaded with rosy bloom, and a smart shower had scattered the pink and white petals on the cool earth beneath. The borders on either side are filled with such old-fashioned flowers as York and Lancaaster Roses, Pæonies, Larkspurs, Phlozes, and Solomon's Seal. A seat beneath this leafy tonnel was a favourite resort of the late venerable Earl. There he would sit and ponder, with nothing to disturb his reveries save the songs of the blaokbird, the thrash, the goldfinch, or the amorous desoants of the nightingale, all of whioh, and many others, found safe and happy homes among the twinkling leaves.

In some of these old gardens, the walls are not the least attractive feature, whether at the time when the Aprioot, Plum, Neotarine and Peach are flowering, or when the lasoioas frait fows in rich, tempting festoons and olusters. Sometimes that saucy fellow with the "golden dagger," will put his nest in the branohes of a Morello Cherry, in the midst of the silver tassels, or among the snowy rosettee of the Pear; and in the chinks and crannies, blue-tits and wrens build oosy nests. The copings of suoh old walls, too, afford a footing for House-leek and Stonecrop, Wallflower and Snapdragon, Polypody, Spleenwort and Maidenhair Fern, with the elegant little Toadflax.
Opening a door in the opposite wall, one suddenly comes upon the delightful pleasaregrounds. The broad, smooth lawn, close and noft as a oarpet of emerald pile, are chequered with the shadows of stately Cedars and pillared Beeohes. A gentle slope leads to the river Colne; one espies its silver ribbon beneath the branches of anoient Thorns. Here and there are herds of fallow deer resting and ruminating in the shade.
Some of the finest Silver Firs in Britain flourish here, with Limes, Beeohea, Hemlook Sprace, and a large oollection of coniferous trees. Kew Gardens, we believe, were largely furnished from Cassiobary in the time of the Capels. In the orangery are some old trees, drooping with fruit. Near to this house is the quaint pleassunce of the late Lady " A." It is a rectangular plot, with a a low lattioed screen in front, covered with crimson China Roses. At the back is a screen with Roses and Clematis. In this are three ciroular openings-happy thought!-eaoh affording oharming views into the adjoining woods. The effect is startling! It gives one the impression of three oharming landsoapes, ohanging momentarily with the changefol light. Passing through one of the green alcoves, we come upon a sheltered dell and rockery, rich with a variety of Ferns ; then a seulptured fountain, and, bending over it, one of the many Willows reared from a outting brought from St. Helena, which still droops over the spot where Napoleon was first buried. Such is bot a brief glimpse of one of the finest old gardens in England: historically famons, rich in antiquities, and abounding in interesting specimens of trees and shrubs. The inhabitants of Watford are not slow to avail themelves of the privilege of walking through the delightfol park, and now and again strolling through the gardens and plemare-grounds.
My next old garden is part of the historio Moor Parle eutate. There are few hislorio
remorta for north-went London better rewort for north-went London bettor known
than Moor Park, and eapecielly among nohool
children. The late noble owner, Lord Ebary, probably never refused permission to ramble in his beautiful park. In the midst of it stands the stately mansion, onoe the residence of the unfortunate Duke of Monmouth and his Duchess. The eatate, it may be remembered, was once the property of Cardinal Wolsey, whose great honse stood, enoiroled by a moat, some hundred yards below. He was visited, while residing here, by King Henry VIII. and Queen Katharine. The oardinal's Oak still lives.

The park, some 500 acres of rolling sward, has many magnificent Oaks-a grove of them near the upper pleasure-grounds are pollarded. It is said that this was done by command of the Duchess of Monmouth on the desth of the Duke. On the east front is a grand old Italian garden with marble fountains and statuary. It is a brilliant spectaole in the sammer months aglow with dazzling oolours. From these, the dazzled eye finds relief in glanoing over a spacious lawn with noble Beech woods to the left and right. This is a favourite resort of herds of fallow deer. In the distance, softened by blue mists, one desories the northern heights of London. Moor Park was onoe the residence of Commodore Anson, who delighted under the guidance of the famous landsoape gardener, "Capability" Brown, to embellish and improve the gardens and pleasuregrounds, and this beautiful and spacious lawn was one of his improvements. From the Italian garden, one may walk through the grounds, rioh in rare Conifers and splendid trees, and enlivened here and there by bright colours.

At a quarter of a mile from the mansion is the large, old-fashioned kitchen garden, also the work of Brown. This is even more interesting thar the lawn, with its fountains, statuary, and Yews. It is an oblong, of from five to siz acres in extent, surrounded by high walls, and bordered on the soath by an extensive range of glasshouses. The broad, smooth walke are margined with herbaceous flowers and fruit-trees, among which is a line of dome-shaped Pears-a oharming pioture when the trees are in bloom, and not less beautiful, though more tasteful when loaded with handsome froit.
A distinguishing feature of these old-world gardens is the mingling of flowers, fruit, and vegetables. On entering the gardens from the park the coup d'ceil is charming. A geometrioal lawn slopes away southward, gay with Roses, Carnations, Zinnias, Asters, Violas, and choioe bedding plants, a most interesting and delightful mass of mingled oolour, fragrant with Mignonette, Heliotrope, and Stooks. On the right is a frait quarter, with soores of varieties of Apples, Pears, and Plums. Broad walks ran east and went through the garden, the oentral one margined with raised borders, is thiokly planted with a host of old favourites, Hollyhoaks, Fuchsias, perennial Larkapars, Preonien, Phloxen, Foxglove, Hydrangea, Campanulas, Gladiolus, Agapanthus, Swoet Briar, Clematis, perennial Sunflowers; and, nestling in the crevioss of the burrs, oushions and rovettes of choioe alpines. The gardens are fortunate in having a broad setting of emerald sward and waring woods, while in the distance is seen the silvery-grey line that marks the valley of the Thames as it sweeps by Windsor.
The walls of this fine old garden are covered with Peaches and Neotarines, Pears, and Plums, While one stretoh of them was covered this year with an enormous crop of Apricots-a charming picture, though asarcely more beautiful than when loaded with the snow-white blossoms, beehaunted all day long. One must not forget those hedge of Rosemary, Luvender, and $S$ freet

Briar, nor the lines of stately Hollyhooks, hage
pyramids of glowing oolour. pyramids of glowing oolour.
There are several delightful old gardens in the neighbourhood of Harrow Weald and Stanmore. One of the finest is that of Bentley Priory; half a century ago the Priory was the residence of the late Queen Adelaide. On the south front is a fine Italian garden, with ststuary, fountains, and Irish Yews. A distinguishing feature of the garden a few years ago, was the huge cones or pyramids of blossom standing at intervals of a few yards. They were from 10 to 12 feet high, and 7 feet through at the base. The plants, Pelargoniums, Clematis, Heliotropes, Tropæolams were trained to stakes, and the effect of these buge cones of blossom was surprisingly beantiful. During the months of Jno, July, August, and September some grand Orage trees loaded with fruit were placed along the terraoe. A spacious park engirdled with fine trees stretches down to a lake, and beyond, at a distance of 4 miles, is seen Harrow Hill, with its charch. It is a relief to tarn from the brilliant parterre and sparkling fountains to the delightfully oool greenery and shade of the Cedar garden, with its bowers of Roses and the winding paths of the fernery.
At the distanoe of half a mile, on the margin of Stanmore Common, there is another delightful old garden, onoe the property of that wealthy penmaker and connoisseur of art, Joseph Gillott. No part of this garden is visible from the high road, but the worthy lady to whom it now belongs from time to time throws it open to visitors from London. Sometimes it is a party of hundreds of elderly poor folls; at another, a number of distriot visitors or soripture renders; or, again, at another, a large party of Sunday-school teaohers. Recreation, rest, and ample hospitalities are provided for each and all.

A distingaishing feature of this old garden of 21 acres, is the fine oollection of coniferons and deciduous trees, the latter remarkable for their brilliant foliage. One might wander for hours beneath the cool aroades, and emerge suddenly on the borders of a landsoape steeped in sunshinewoods, waving cornfields, placid lakes haunted by wild-fowl; while, on the horizon, is the stately grey pile of'St. Albans Abbey. The Lady Bountiful of this grand old garden, Mrs. Brightwen, with its statuary, olipped hedges, and borders filled with ohoice herbaceous flowers, is never happier than when she sees others enjoying its manifold charms. T. W.

## New or Noteworthy Plants.

ODONTOGLOSSUM ASPIDOREINUM, Lamm, spec. nov.
THIs is beyond any question the most floriferoas Odontoglot yet discovered. Not only does evers preado-balb produce two flower-spikes at one time, bat they do so for two and even three years in anccossion, a character which, though common among Muedevallias, has not yet been oberved with Odontogloseum. It is therefore quite common to meet with comparatively mall masee, which are set with twenty to thirty flower-apikes at one time, and as many as thirty-eight have been observed on one plant. Such planta look very charming and ornamental, more eapecially as the flower-upites atand apart from and alightly bend above the ahort narrow leaves, thas forming a wemi-globalar flowerivg mass of great beauty. I think acarcely anything more gracefal as a centre plant at a dinner-table could be imagined. The flowera vary somemhat in the colour of the lip, being sometimes pare white, but more frequently more or leas apotied with tilacorimson. The name is given in allasion to the peciliarly upright bent staminode atandiag like : shield above the now-like rontellum.

(exI P. 358.)

Planta denue, crapitove, attaining but amall dimenaions. Paendo-bulbe long-oviform, atrongly compresed, deeply plaited, two-leaved, 4 to 55 cm . long, 3 to 35 cm . broad. Leaves atiff, papyraceous, caneateooblong, abraptly caspidate, 15 to 18 cm . long, 1 to 1.5 cm . broad. Fiower - apike not inclined to branch, 30 to 45 cm . high, nine to fifteen flowered. Sepals and petals oblong, contracted into long ligalate pointe, and slightly nodalate at the borders, 35 to 4 cm . long, 06 to 08 cm . broad, clear yellow, blotch $\pm d$ more or leas with red-browa; the patale a little amaller than the sepale. Lip abpandariform, longnaguicalate, at the margin finely fringed, at the apex abruptly contracted into a sharp convolute point, 35 to 45 cm , long, 15 to 18 cm . broad, pure white, more or less epotted with lilac-crimson. The crest consinte of four teethlike lacinix, of which the two lateral ones are protracted into villose cirrhii. The borders of the unguis are densely villose. The colamn, ditticgaished by a deep atigmatic cave, bears at the apex on either aide a narrow cirrhiform apreading auricle, and is of a light yellow tint. Tae ataminode is protracted, and bent upright into a flat triangular point, standing shield-like above the rostellum.

Habitat, Colambia. licowa on trees in dense foreats on the eastern declivities of the weatera Aade of the Cance, 2200 to 2500 mejres above the nea. (Vid, Plant, Lehmannie, N. 10021 ; Lahm., Ic. Plo, t. 1001.) F. C. Lehmann, Popayan, Auzust, 1895.

## Cbroprala debilis, No. E. Brown (n.sp

Tabar flattened, with a short woody neck, prodacing several slender weak atemias mach as 3 to 4 feet in length, and about half a line thick, pendulous under caltivation, glabroas. Leares rather distant, half to 1 inch long, and aboat half to three-quartere of a line thick, succulent, subterete, alightly flattened on the face, acute, more or lese carved, with petioles about 1 line long, glabrous, light green. Peduncles quarter to half an inch long, glabrous, bearing one to three 盺ers at its apex. Bracts minate. Pedicela aboat 2 lines long, glabroas. Stpals 1 line long, lanceolate-acate, glabroas. Curolla 1 inch long, atraight; the tabe five-eighthe to three- q larters of an inch long, ovoid ioflated at the base, and there about 2 lines in diameter, cylindric and narrower above, scarcely enlarged at the moath ; the oataide is glabrous and pale parplish, the inside is aparaely covered with reflexed hairs in the uppar part; the lobes are 3 to $3 \frac{1}{2}$ lines long, erect, with connate tipl, lingar from a deltoid bake, replicate, greenith, with a blackish-purple keel iaside, glabroua outaide, covered with rather long, curly parple haira on the inner face. The outer corona is about half a line long, cap shaped, with five short crenations, and alightly ciliate along the margin within; the inner cosonal-lobet are $1-1 \frac{1}{4}$ line long, erect, narrowly ubinceolate acate, and doraslly connected at their base to the outer corona by five partitions; the entire corona is white.
This very diatinct and rather paculiar spacien was first tent to me frota the Gardeners' Chronicle Office two or three veare ago, and aubsequently I learnt from Mf. J. O'Brien that it was went to him by Mr. J. Buchanan, who collected it near $Z$ ymbs in $N$ jaces. land. It differs from all the other apacies known to me by its weak, pendulons stems. N. E. Brown.

## CYPRIPEDIUM $\times$ LORD DERBY (ROTHSCHILDIANUM $\times$ SUPERBIENS).

Our illustration (iiz.66. r. 35i) represents the Cypipedium $\times$ Lord Darby exhibited by Thomas Bratter, Efq, Stand Hall, Whitefield, Manchester (aardener, Mr. R. Johnon), at the meeting of the Orehid Committee of the Royal Horticultaral society, Angote 13, when it was unanimoualy duction of its clase, although at the beat introthe committee thought it nimilar to C . Members of superbam (Rothachidiannum $\times$ auperciliare), mannum meat which they ultimately withdrew on the dif.
frreace in the parentage and the saperior qualition of C. $\times$ Lord Darby being pointed out. Ose or two other hybride of repatedly the same parentage have been recorded, but the fact remains that neither in aize nor stately beanty of the flowers, or in the brightness of their coloura, has anything comparable to Mr. Statter's production been pablicly exhibited. The upper aepal is white, with a greenish tinge at the bare, and with some fine parple lines ; the petals ivory-white epotted with purple, and the lip brownishrose. Few and far between do anch rewards fall to the lot of the patient hybridist, and Mr. Statter is therefore to be congratalated on his very handsome protege.

## THE SEED TRADE.

The Grass and Clovgr Sbed Cropso-The retarns from the seed-growing districts in Germany, so far as they have come to hand, appear to show atikfactory crops. Meadow Foxtail Grrass is but a poor yield, as the late spring froste did the plants considerable injary, and the drought setting in when the meed was maturing, caused a farther loss of crop. Seed of this kind is expected to be very scarce and high in price, especially as home grown crops are decidedly below an average yield. Bent Grassea (Agrostis) also suffered from the weather, and the supply, both from Gormany and the United Staten, is very limited, and high prices must rale. The waved-air $G$ ras, Aira flexuona, promisen a full crop; the plant is well adapted for sheep pastares in dry nataral posilions. Sweet Vernal is a fine crop, and the quality exceedingly high. This is about the earliest grass to flower, and is known as the Spring Grase in this country. The tall Out. Gians, Avena elatior, has yielded a crop decidedly below the average.
All the Brome Graneen nhow a good yield, but an they are for the mont part of a roagh quality, containing bat little nutriment, and dialiked by catcle generally, they are not much emploged in this conotry for agricultural parposes. The Prairie Grass (B omus Schreeleri), or more properly B. commalatas, appears to be the only one in ase in this country, probably on account of ita herbage in spring affordiag an early bite to heep and lambs. Crested D gess-tail Grass has suffered somewhat from the waather, bat there is a fair yield of good seed, alchough it may have lost some of its brightnese. Tais is a grase natural to high and dry pastaren and sheep-downe, where probably no other species is more valuable, not only on account of the compactness of its fiae thort foliage, which is highly agreeable to the close-cropping animala that feed upon them, bat because owing to the depth to which the roots panetrate, it remains green during the drient parts of the ammer, or at leat, long after moat other species have withered. Cock'r-foot Grase (I) setylia glomerata) nows a good crop in the Uaited Siater, quite one-foarth larger than last year, and thoagh the seeds are momewhat discoloured, their germinating power is all that can be denired. From Naw Z saland comes good bright seed, but it does not germinate so well. It is a valuable grasn, generally liked by eattle, unleen when allowed to become coarne through neglect. Fencas Grasses thow a varying yield; Sheep's and hard Feaceaes, though not a fall crop, appears to be ample. The fine leaved variety shown the largest yield, but as aevare cleaning will be necessary to ensure superfine samplen, pricen are expected to be high. The yield of Meadow Fencus is large, and seed of very fine quality han been harveated; tall Fescue is a good average crop of fine quality.
The Yorkshire Fog Grass (Holcus lanatas), nhows a satiofactory yield of good amples. It in a grans which yield largely to the cythe, and where abundant and laxuriant, as it' often is on moiat peaty tands, it wonderfally increasee the bulk of the hay crop, though the hay is woft and apongy. It is recommended that when the hay in which this grass abounds is carried, aprinklings of salt hould be given to make it more palatable. The
and

Meadow Grasean (Paas), mow a good yield aloo ; the rough-atalked (P. trivialis) is excellent in quality. the emooth-stalked (P. pratensis) given a large yield of very fine seed.

The Rad Canary Grasa (Phalaris arundinacea) shows a large crop in Germany, though it is used in this country to a very limited extent, the herbage being too coarse to be liked by cattle generally, though it is said that the creeping shoots have a aweatioh Glavoar, and are greedily devoared by pige, who doubtless find them nutritious. It is common in many parta of this country on the banks of rivers, pools, and ditches. OI Timothy Grase (Palenm pratense), nothing cin be said at present with certainty in regard to the probable yield, though it is said to be good both in Rassia and Gurmany, It is sometimes aid that it is a grass not generally found in the-best natural pastures in Great Bitinin, though that is a controverted statement. It attains to its best quality in a deep and retentive soil.

All kinds of Clover appear to have brought, or to be bringing good yields this year, and eapecially so the white variety. Alsike, Trifoliam incarnatam, Trefoil, and Sainfoin all promise well, bat the vield will depend upon the weather, whether favourable or otherwise. Pisum

## ASTILBE LEMOINEI.

Under the generic term of Aotilbe we inclade the whole of a group of plants with perennial stock, herbaceona stems, the foliage deeply cat, and large branching inflorescences componed of a maltitude of mall flowers; in colour white or pale rose, individaally insignificant, but prodacing a remarkable effect owing to their numbers. The plants have the appearance of baing related to $S_{p} i i \ldots \infty$, of tha Arancus section, so that many of them, after long cultivation, are commonly known under the name of Spirxa, whilat botaniats have aloo givon them the name of Hotera; we believe it is quite jastifable to inclade them all in one single genus, the genas Astilbe, as most of them have been produced through the easinens with which they cron, an inconteatible proof of kinship.
The name of Spirea should be at once absolutely rejected. Spireas belong to the order Rosace, and are characterised by the existence of numerous stamens, and of a pistil formed of from three to fivo carpels, uaually free. Astilbep, on the contrary, are Saxifragen, and have from five to ten stamena and two carpsis, unally more or less united-at any rate, at the base.
The genus Astilbe was founded on A. rivularis, Hamilt, a perennial ahrab, a native of Napana and temperate region of the Himalaya from Cabhmir to Bhotan; it has apreading rhizomes, apreading radical leaves, twice divided into three, the divisions dentate, the petioles farnished with numerous dall-colorred hairs. The atems, which grow up to nearly 5 feet, bear several alternate leave日, and are terminated by a large paniculate trazs formed of namerons amall flowers. The corolla is deficient, the lobes of the calyx numbering from four to five, are yellowishwhite, and the eight or ten atamens are pure white. Astilbe rivularie does well in a gravelly nitaation ; where it is fresh, and partly shaded, it forme a nice decoration for the borders of laker, \&ce, bat it it necensary to cover it with leaves daring the severe cold of our wintera.
Under the name of Astilbe rubra, Hook, there was introduced, more than forty years ago, a apecien indigenous in the mountains of Kameya, and north east of Bingal; it was diecovered by Grifitith, and wout to Kow by J. D. Hooker and Thomson, who fonad it thriving at altitader of from 5000 to 6000 feeth It differe from the preceding species by the existence of five rose-coloured petaln, arranged in ataro like form, and by the abandance of large redidias brown hairs which are on the stems, leavell, and inforescencer. The species is also known as Antilibe rivalaris rabra, and cannot etand very mevere wintert. Astilbe decandra, from America, was introduced into England about 1812; it is like the precedids
species, in habit resembling Spirma Aruncas; leaves large, biternate, of a glacous tint ; the flowers, borne in ramified panicles, are white.
Antilbe chinenais (A. odontophylla), was introdaced not many yeara ago from China, but does not appear to be widely known, at it is not included in borticaltaral catalognes. It rarely exceed 2 feet in height, the leaves are triternate, and the flowers white with parplish-bronze badings. This may perhap: be a variety of the following apecies. Aotilibe Thunbergii, Miqzel (Hoteia Thunhergii), was introdaced fifteen years ago from Japan by Mearta. J. Veitch \& Son, of Chelrea. It is a pretty apecies, with very elegant foliage, of which the folioles are petiolate, oral, and covered as well an is the entire plant, with little ailky hairs; the ramified inflorencences are
foliis aureo-reticulatia (about 1871), the foliage of which is green, variegated with yellow along the veins of all the foliolep, and the infloreacences of which are more tofted and compact than in the type; also A. japonica foliis-purpureis, the foliage of which is whining bronze, at least in the young atate, pasaing to dark green when completely developed; and, fiaally, A. japonica compacta multiflora. This lat kind, lately put into trade, is destined to supplant the common variety for all purposes for which it is suitable. The folinge is firmer, more developed, the inflorescences are larger and more ramified, and form white plamy-looking tufte; it appeare that this variety in a form of A. japonica with leaver reticulated with yellow, but the foliage of which has retarned to ite normal colour, and the paniclen, already more
name is no more ridiculous than many terme in botanical nomenclature, auch as Dracena Draco, Ervam ervilia, Specularia apeculum, \&c..*
A. (Spiroa) astilboiden grown from about $1 \frac{1}{2}$ foot to 2 feet high; the pinnatifid leave have reddibh petioles; the foliole oval, pointed, much toothed, hairy, of a brown-green colour; the ramified floral stalks are covered with little white flowers, denae, Which are in the form of a tubular calyx with five white lobes, five white petals, ten white stamenc, and two onited carpels. This opecien, as a perennial, liket a ailicious soil, and it particularly effective in rockwork, but is eapecially valuable for pot-cnltare and for forcing, under which very pretty flowering apecimens can be raised.
The origin of a variety, called by fit producer, M.

Fig. 67.-astilbe lemolnfix. (aer P. 358.)
perfectly erect, ard bear flowers with petal whito merging into pale rose, elegantly set along the floriferous branchev.

Everyone knows Attilbe japonica, Miquel, more often called Hoteia japonica, Morr. and Desne, or even Spirza japonica, Hort. It in a plant covered with long brown hairs on the base of the ateme and petioles, with radical leaven in tufte, trifurcate petioles, folioles oval lengthy, almont coriaceons, of a dark bright green on the apper auface; panicles atraight, ramified, while the bracty, the pedicels, the calyx, the corolla, and the stamens, are pure white. This species, when grown in quantities for forcing, is tho an excellent perennial plant; it likes a peaty soil, and generally a cool and half-shady woil. The rhizomes are perfectly hardy, but very often the young whoot are deatroyed by pring fronts.

Many other varieties of A. japonica are aleo cultivited. By hybridising has been obtained A. japonica
compact, have proflted by the increated vigour due to the return of the chlorophyll, and gained atill more in aize and abundance.

The year 1879 marked the firt appearance of a new speciet, for which numerous namen are not lacking. It was, in fact, at that time that Mr. William Bull, of Chelses, who introduced the plant, sent it ont at Spirza nivoa; the following pear he showed it under the name of Spirea Aruncan astilboides, a designation applied to it by the Kaw botaniats; or aimply a Spiran astilboidea, a term under which it soon became popular. Maximowicz, who had discovered it in Japan, eparated it from the Spizent, and called it Arancus atilboiden, Maxim. But the Arancus are also Spirseas, and all the characteriatice of the plant we allude to refer it to Astilbe or Hoteia; so, keeping the specific name, now perhaps too widely epread to be changed, it thould be named Astilbe astiboiden. Really this

1) eabois, of Ghent, Spirea satilboide floribunda, is discribed in the Rerue de l'Horticulture Belge for 1891 (p. 145). One day M. F. Wiot, of the firm Jacob Makoy et Cie, of Liège, showed M. Desbois a rapid method of multiplying A. (Spirea) antilboides, from seed. "I sowed them in the month of May," anid M. Dasbois, "I often remarked that the folinge of these seedlinge wat dark green, almont renembling that of Spirse japonica, inatead of exbibiting the metallic-brown tiat of the type.

The following apring I was atruck by the distinctive characteriatice of my eedlinge and of the type; I atill more admired the fine thyrsoidal trasees of flowert much more close and namerous in my eedlings. I deemed myself authorised henceforth to connider my acquinition at a new peciet."

[^30]M. Desbois thought that his plante corresponded to a specific type of A. (Spircea) astilboider, while the plant origioally introduced under this name was an inferior variety of the ame type. We think that, on the contrary, his plant was a Datural hy brid between A. japonica and A. (S.) aatilboides, probably calcivated at a little apace apart one from the other in his garden, and easily crossed by the insects of all kinds which never cease to visit thene flowers. We believe this for two reasonn: the first is that $\mathbf{A}$. (. o $^{\text {. a atilboides, from seeding plants sold by the frm }}$ Jacob Makoy et Cie., were exactly similar to the type ; the second reason is, that we have artificially crosed Aatilbe japonica with A. (S.) astilboides floribunda, and have obtained all sorts of intermediate forma many of them very fine, and aperior to both parents. The accidental bybridiaation just mentioned is therefore possible. As thene varieties have not been anfficientiy atudied, and as they are not yet re-named, we will refrain for the present from apeaking of them. We will, on the contrary, say a few words about another hybrid, Astilbe $\times$ Lemoinei, the prodaction of which tend to confirm the theory advanced above, namely that Aatilbe Thunbergii, Hoteia japonica, and Spirea astilboides are bat pecies of the same genus and should be classed as Astilbe.* We owe this novelty to a cross effected between A. Thanbergii and A. (\$) astilboides floribunda. Here is the detcription:-foliage very elegant, rising to 19 inches in height; long ramified petioles; large folioles broadly oval, dentate, goffered, farnished with very bright green hairs and with a sating look. Immediately above rise broad ramified paniclea borne on firm peduncles, and forming plumy inflorescences 19 inches high; the fiowers have five white petals, ten rosy stamens, and two carpela, and are extremely numeroup, and the general appearance is of white, nlightly rons. Placed alongside of A. (8) antilboides floribunda, as shown in the photograph, the new plant is seen to be twice so high, the time of its flowering is intermediate between the times of its two parents ; it blooms in the course of Jaly, some days before A. Thunbergii, one of the latest of the genus. Lastly, Astilbe Lemoinei is absolutely hardy, and an well adapted for forcing, as is A japonica, which it excels from every point of view. Emile Lemoine.

## Orchid Notes and Gleanings.

## Cattleya warscemiczif, COUNTESS OF DERBY.

This unique form of what ia popularly known as a white C. gigat is now in flower at Stand Hall. The plant, which was certificated last year, has been divided, and both pifcer are now in flower-one with three flowers, the other with two. That which atrikes the orehidist most is the distinctness of the colours of the flower; the segments are white as now, and the lip is velvety-crimson, with the upper portion having two orange - coloured eje: ahated white. Then the crimuon, which ir of the deepest hue, runs ap from the lower division of the lip to the bee of the column. No florist flower could be more distinct in its lines of colour, which do not shade into each other like many apecies and varieties, bat ohow the divisional lines in a marked degree. The lip, toe, although bifid, forms twothirds of the outline of a circle, and the lobes overlap one another. Traly this is one of the grandest of Cattleyar, and it is to be hoped that the numerous importations will give as a few more sach. Tho plants are growing in cylindrical baokets suapended from the roof, and are in the best of health: indeed, all Mr. Statter's Cattleyas under Mr . Robert Johnion's care are in exceptionally good healtb, and yield in their seaton antisfuctory crop
of flowers. J. foweris. J. $A$.

[^31]
## Masdevalifa Lowif.

This atill remains one of the rarest, as it is also one of the most atriking, of Masdevallias. Belonging to the M. Chimæra section, its flowers bear little rememblance to any other member of the groap at present in cultivation, alchough it in doubtless closely allied to M. trinema, A bealthy plant of M. Lowii, possesaing about a dozen leave is in bloom in the collection of R. I. Measures, Eiq., Cambridge Lodge, Camberwell. The well-displayed flowera have long triangular equal sepals of a greyish-white tint, profusely spotted with red-purple except at the tips, and bearing at the base of each two or three purple liner. The amall, almost flat-shapad, dark purple labellum is a very pecaliar feature. It was illustrated in the Gardeners' Chronicle, Sept. 6, 1890, p. 268.

Orchids at Megsrs. Jaf. Vietch \& Sons.
In the Royal Exotic Narsery, King's Road, Chelsea, the waning show of Oiontoglosanms, Masdevallias, and other cool-house Orchids, is succeeded by the occapants of the warmer houres, the Cypripediama, which are more or less represented here every day in the year, making an exceptionally good diaplay, and the house in which they are arranged is gay with their varied blooms. Among the prettiest are C. $\times$
"H. Bullantine" (Fairieanum $\times$ parparatum), a charming and neat bybrid, as are all the other bybridm of Fairieacum; C. $\times$ tesaelatum porphyreum (concolor $\times$ barbatam), an old bat handsome and atill rare variety; and C. $\times$ Clinkaberryanum (philippinense Roebelinii $\times$ Cartisii, a noble flower which was illuatrated in the Gard. Chron, 1893, Jaly 22, p. 86. Among other also we noted C. $\times$ Morganix, still a leader in its section; C. $\times$ Chas. Canham, a noble flower; C. $\times$ ceasnthum, and its variety superbam, in many varieties; and the forms of $\mathrm{C} . \times$ Ashbar tonix, equally numerous; C. $\times$ orphanam, C. Carnusianum, C. $\times$ Youngianum, C. $\times$ conchiferum C. $\times$ Io grande, C. $\times$ polyatigmaticam, C. tonanm, C. Chamberlainianum, C. Curtisii, C. $\times$ cardinale, C. $\times$ leucorhodum, and others of the Sedeni class; and ataged with them was a grand form of Vanda Sanderiana and other rare species.
In anosher house, with Cologyne Massangeana and other species in flower suspended overhead, was a well-flowered batch of the pretty white Dendrobiam Dsarei, D. formosum giganteum; the glowing rosycrimson D glomeratum, with a profasion of flowers; D. Phalæ ropsis S:hroderianum, in good example and great variety; D. bigibbum, D. aperbiens, \& small bach of the handsome D. McCarthiz, some pretty plants of Saccolabiam coleste, Phalenopsis violacea Schroderii, Angracum citratam, \&c. In small groups arranged along the staging was a very effective and showy dieplay of the soft carlet Habenaria rhodocheila; the handsome vermilion H. militaris; the flesh coloured H. carnea, which has alno prettily-marked leave ; and of H. c. nivona, its pare white form, which has plain green leaves. Alsoa plant of the pretty Nephelaphyllum palchrum, with bronzy leaves and curiously formed flowers; and other apecie of botanical interest.

In the Rockery-house, where a thow of Oichid is always maintained, the most atriking plants in flower were fine apecimens of Vanda tricolor and V. nuavit, the soft cinnabar-scarlet tinted Epidendrum cinnabarinum; Grammatophyllum Fenzlianum, Sobralia Lacasiana, Oncidiam microchilam, and other specien of Oncidiam; Miltonia Clowesii ans M. spectabilis radians, Paphinia rugosa, Odontoglosam grande, O. Bictonense and O. B. albam, M. Rofzlii, and some fine coloured specimena of the large-flowered type of Miltonia vexillaria.
In the Cattleya-house, the form of Cattleys Eldorado and C. Loddigeaii are the principal plants in bloom; and the Nepenthes-house and the ornamental intermediate-house rockery are very beautifal, a group of the different forms of greenhouse Rhododendron well diaplaying their carlet-orange, yellow,
pink, and white flowers.

## Cochlioda,

This amall genan is clowely allied to Odontoglos oum and the old Menopinidiam, which in now
merged with it. The plants belonging to it an evergreen, and require cool treatment; and they aro natives of the Peruvian Anden. Cochlioda Noez liana is a very handrome and distinct novelty, which was introduced in 1891 by Messrs. Linden of Brousels, through Mr. John Noezli, after whom it named. It is a most welcome addition to our cool Orchids, being distinct in colour; moreover, the rich orange scarlet tint of its flowers is one thet is very little represented in the Orchid family. In habit of growth it closely resemables C. valcanica having ovate-oblong, compressed pseudo-bulbs, and long, narrowleaves. The scapes are produced from the base of the completed bulb, and are pendulous, manyflowered, in some instances branched. The flowen are about 1 inch in diameter, and of a soft brilliant orange-scarlet; the lip is trifid, of the same colour as the sepals and petals, with a golden- yellow dian The column is bright violet-purple, which prodices a atriking contrast with the acarlet of the remainder of the flower. The flowering period is May and June, and for this reason it should be found valuable as a summer exhibition Orchid. The flower is very endaring, and we have been able to we the same plant at several exhibitions. We have found it succeed best grown in bankets, in a compont of peat and shagnam-mon, with good drainage, Daring the growing seas on it should receive a liberal supply of water. Propagation is effected by dividing the pseudo-bulbs. Orchid Album, vol. xi., part 128.

## Oncidium ornithorynchem albiflordm

was first flowered by the late John Day, Esq., of Tottenham, a mont enthaniatic Orchid grower, and whose collection was one of the largent and mont complete ever brought together in this country, bat unfortunately was dispersed some years ago on the death of its owner. This variety is in the habit of it growth similar to the type, and is quite an floriferous as the species, ita beatiful white flowers being produced, in some cases, everal together from the base of the leaven, and are pure white, saving the yellow calli at the base of the lip. It is a very useful subject for cutting parposes, and on that account should be eagerly sought after by collectors. It should be grown in a compost of peat and sphagnam-moss in a basket, and placed in the Cattleya-house at the shady end, a liberal apply of moistare being required daring the growing eeason, and afterwards only just sufficient water should be given to keep the pseudo-bulbs from ehrivelling. This plant may also be grown in the cool-house, but we prefer the Cattleya-houne, having found that it does better there. It is propagated by division of the pseado-bulbs. The flowera are produced during the nummer montha, and last a considerable time in perfection. Orchid Album, vol, xi, part 128.
M. Vuylstere's Orceids.

Among thene I noted Miltonia Emprenm Augusta Victoria, of unumal habit, bearing a flower of over 4 inches ( $10 \frac{1}{2}$ cen.) in height, by 3 年 inches ( 9 cen.) acrose; the two lateral sepals are each 4 inchen long; the lip measures 3 inche wide by 23 inches in height. The colouring of thil flower is admirable, peculiarly dark rose ; the division are more pointed than those of the type. I would mention also a plant of Cattleya gigas, the very large flowers of Which had spreading division of an exceedingly delicate coloar; the handsome dark lip is abouk 4 inches long by 3 inches wide. The seedling Odontoglosam before noticed continues to thrive. I admired a fine form of Cypripediam Charles Canham, good flowerm of C. Da Bosscherianum, Loochristiensim, and other varieties. Ch. De Bosschere.

Trees and Shrubs.
CUPRESSUS (RETINOSPORA) SQUARROSA.
A pine plate of thim Conifer, aeen at Linton Park, near Maidatone, and others a tritle smaller, in Yors: shire, a few days aince, remind one of its grest beanty and distinct ailvery appearance, and prove
that it is quite hardy enough to endare our Eaglieh climate, even when the thermometer fall below zoro. Like most of the genas, it is rather alow in growih, but this is an advantage in some instances, as many of the Pines and faster-growing trees become naked and uasightly after forty years' growth, an appearance which the plant under notice is not likely to have in the same period. W. $H$. Divers, Belvoir Castle Gardens, Grantham.
The Orange, or Golden•berried Mountain Ash.
I was very much atruck a few weeks since on seeing an avenue of this tree above 100 yards in length. I do not remember having observed it planted in quantity before; indeed, it is a tree rarely to be met with. This variety of Pyrus ancuparia should be planted about the gardens and pleasure-ground an a companion to the red-berried variety, which is also to be zeen in fine berry this season. I was informed by Mr. Goodman, the owner of this avenue, that the birds never touch the berries of this variety until long after they have eaten all the red berries, which is a point in its favour. The specimens aent have been gathered three weeka. Edw. Bennett, Lyne, Chertsey. [The banche of fruit sent by our correspondent were of a beautifal orange tint, and profusely set with berries, showing how favourable the weather had been when the trees blonomed. Ed]

## THE SYLLABUS OF THE SUMMER SCHOJL OF HORTICULTURE

 AT CHELMSFORD.The course of elementary intruction in Horticulture was given at Chelmsford daring the firat three weeks in Jaly. Owing to the nize of the clase and the nature of the intiraction, all the work (with the exception of the three chemical lectures) was carried on in a shed roughly fitted ap as an extemporised botanical laboratory - the continuoas fiae weather making the necentity pleasurable.
At a rule, the ecientific part of the invtruction wat given in the morning, and the more parely horticultural lecturen and demonatrations during the sfternoon of each day. Visits to nurseries, gardens and aeed farms in and around Chelmsford, formed an interesting leature of the programme. The following places were vinited:-

1. Pripate garden of the Mayor of Chelmaford. 2. Trial plot. of Mr. Callen, seed grower, Witham. 3. Seed farm and orchard of Mr. Seabrook, Springfield. 4. Town farm (for the disponal of sewage) Caelmuford. 5. Fruit and general nurwerie of Mr Saltmarsh, Moalsham, Chelmeford (Two visite). 6. Meloa and Tomato honves of Mr. Miller, Chelms ford. At all these place the class was received with the utmont kindnens and liberality. The atadenta in each case were taken round either by the principal or his manager, and full, interenting and inatructive information was given throughout.

At the end of the course an examination was given by Mr. John Frater and Mr. David Houston.

The following was the course of practical inatruction given by Mr. John Frater:-

## DEMONSTRATION I.

THE SOIL AND ITS PREPARATION.

1. Preparation of land for the growth of crope, and practice in the use of implemente.
(i) Garden ground should be trencbed every second or thifil jear ; part of this should be accomplished every year
(b) Take out a trench 2 ft . wide and 18 inches to 2 ft . deep.
(c) Wheel the soil, as it is taken out, to the far end of the quarter to be trenched.
(d) Cut the two sides of the trench perpendicularly as the worl proceeds, so that no hard ridges may be left to retain water as in a trough in winter.
(e) Fork or piek up the bottom of the trench so that the subsoil may be loose and allow superfluocs moisture to d rain away.
(f) If the groued is intended for deep-rooting Carrots or Parsaips, put a layer of farm-yard manare in the bottom of thas trenob.
(g) For other crops, especially shallow-rooting ones, more manure should be placed in a layer about 9 to 12 inches from the surface.
(h) Dis the soil of the econd trench into the first, and ropoit the operation till all the trenches are turned over.
(i) Fill the last trench with the soil taken from the first.
2. Rolling.
(a) Roll the garden walks to make them smooth and frm.
(b) In dry weather it will be necessary to water the walks thoroughly about an hour previously to rolling them, to render them soft, otherwise rolling will have no effoct.
(c) Roll the grass lawne to render them firm and smouth and to destroy worm casts.
3. Practice in the use of the rake, and preparation of need beds.
(a) Level a pieze of ground, breaking the clods and raking off the stones with as little soil as possible.
(b) Make the surface smooth and ready for seed sowing.
(c) Rake off the weeds from ground that has just been hoed, clearing shem thoroughly of soil.
(d) Wheel the weeds to the rubbish heap, and the stones to another.

## 4. Practice in the are of the Datch hoe.

(a) Push the hoe through the soil about if in. to 1 in . below the surface, so as to cut the roots of all weeds.
(b) In doing so, be careful not to cut or injure the cultivated plants.
(c) Hoeing is also intended to loosen the surface of the soil amongst all growing crops, especially in dry weather ; every part should therefore be equally 100 sened.

DEmonstration II.
MANURES AND THEIR USE.

## 1. Farmyard manure

(a) Prepsations for the fermentation of fresh farmyard manure.
(b) With a ateel fork, shake up the manure loosely, piling it ap into a conical heap.
(c) Let it lay for four to six days, according to the rate at bich it heats
(d) Should it be very dry, give it a watering with a rosed watering-pot as the work proceeds. This will assist it to ferment regularly and equally, and prevent violent heating and loss of nitrogen in the form of carbonate of amm nia.
(e) After four to six days, when the heap has partly subzided, shake it up in a fresh heap, with the rank manure in the centre.
(f) After a few more days it will be fit for the making of hot beds and Mushroom-beds.
2. Sampling different kinds of artificial manuren.
(a) Note the colour and general character of guano.
(b) If it smells unusually strong, it is losing ditrogen in the form of ammonia.
(c) It should always be kept as dry as possible, to prevent oge until about to be used.
(d) Note keneral character of sulphate of ammonium.
(e) If in its crytballised form, it is a highly-coucentrated manure coataining about 20 per cent, of nitrogen.
(f) Nitrate of sodium is aleo in the form of crystale, and contains about 15 per cent. of nitrogen.
(g) Compare coarse and finely-crushed bones and bone-meal. (h) Examine the ground phosphates; ascertain and remember the difference between them and superphosphate.
(i) Superphosphate has been prepared by treating the original substances with sulphuric acid.
(j) Coprolites are largely used for the making of it.
(k) The best superphosphates are made from phosphatic (k)
(b) Note the general character of potassium sult, Inown an cainit, and compare with nitrate of sodium, \&c.
3. Preparation of liquid manures.
(a) Get some pure cow-dung, put it into a tank, and fill up with water.
(b) Let it stand for a day or two, cover with a guano bag to prevent the manure from rising, while drawing off the liquid for use.
(c) Dilate it with water according to its atrength, uotil of a pale brown colour and relatively weat.
(d) Water pot-plants with it every secoad or third day, and with clear water on alternate days, if necessary.
(e) Place a bag of soot in a tank of water, and after 24 hours the clear licuid masy bo used as a stimulant. Soot containg a small quantity of ammonia.
(f) Another liquid manure may ba made by putting a handful of guano into 4 to 6 gallons of water.
(g) Use it weak rather than strong, and alternataiy with the liquid from cow-manure.

## PRELTMINARY COLTUBAL OPERATIONS

## 1. Seed-sowing-vegetables.

(a) Prepare a compost of two parts of loam, one part reaf (a) Prepall a part of and mix the whole thoroughly ould, and hall pur ; colully; cuer the (b) Get zome seed-pans aud drain them caroful.
drainage with the rough eittinge of ; press it dowa evealy and firmly, finally making the surface perfectly smooth and level. (d) If the soil ss relatively dry, give a good wateringt through fine rose, and allow the superfluous moiature to drain away. (s) Sow seeds of Lettuce or Onions, evenly and rather thialy all over the surface.
(f) Cover the seeds with a shallow layer ( and mora sandy portion of the compost.
(g) Give a light spriakling of water to ssttle the compost.
(h) Sthad the weed-pang io a greenhorsse, and keep a daily (h) Stand tho arature and the date of the first appearance of the zeedlingw.
2. Transplanting eedlings.
(a) Transplant the seedlings about 1 to 2 inches apart each way into other seed-pans or bores before they get crowded. way into other seed-pans or bores be
Carefully lift with all the rojts intact.
Carefully lift with all the rosts intact
(b) The distance between the to the natural vigour and size of the kind, and the time they are to remain in the boxes
(c) Roturn the boxes to the greenhouse pit or frame, and p'ace on a shelf or beach near the glass to preveat the seedlings from getting drewn.

## 3. Plantiag trees or bushes.

(a) Lift evergreens with a ball of aoil proportionate to the ze of the plants.
(b) Previou, to lifting, take out holes of sufficient depth and width to take all the roots when spread out.
(c) Deciduous trees and ahrubs, when liftelie eutumn and winter, need not have soil attached, ualess of large size.
(d) Cover the roots (1) with the finer soil, (2) with rougher material; (3) tread firmly when the holes are about hall full; (4) give a good watering, and leavo them till the water draine way.
(e) Finally fill up the holes and tread firmly.
(f) Stake the trees, \&cc., if necesary, to guard against wind.
4. Mixing comport.
(a) Make up a compost of three parts fibrous loam, half-a-part each of leaf-mould and well-dec yyed cow-manure with a good sprinkling of sand. This will euit Pelargoniums and other plants of similar characte: Breas up the lam roughly by hand, and do not sift any portion of it.
(b) For Fuchsias, more sand should be used. The compost in this case should be light and rich.
(c) Make up a compost of equal portions of loam and peat, with half-a-part of sand. This wou!d answer for many Ferns.

## 5 Potting.

(a) Drain the pots well according to size, covering the drainage with Moes.
(b) Put a little soil in the bottem of the pots.
(c) Turn out your plant, remove the crocks and the losser portions of the old soil.
(d) Pot firmly, and afterwards give a watering with a rosed watering-pot.

## 6. Siaking.

(a) Stake various plants neatly and effectively, using stakes proportioned to the size of the sane.

## DEMONSTRATION IV

VEGETABLE CULTURE。

## 1. Making nete of Potator.

(a) It in not adrisable to cut "round Potatos" when onls In. to 1 in in. in diameter, nor "Kidneys" unless more than 2 in. long.
(b) The eyes at the apex of the Potato are always the trongert, and one of them should be secured in as many ca:es as possible $f, r$ each set.
(c) For the sets obtained from the bitni ond of the Potato (dect the strongest ejes
(d) Cut the kidneys longitudinally, so as to get a good-sized piece of the tuber for each eye.
(e) Never cut too close beneath the eye of any set, lest the bud should be deprived of proper nourishment.
(f) Relatively large sets are better than emall ones.
2. Preparing a seed-bed for Onions.
(a) With a fork, level the surface of the ground, if it has been laid up in ridges for the winter.
(b) Give a top-dressing of pigeon's or fowl's dung and ajot, forking it lighty into the surface.
(c) Tread the coil all over, firmly and evenly, with the feet, or roll it to effect the same purpose.
(d) Mark off the ground at each end with pega 13 ia. apart.
(e) Stretch a hne from peg to peg along the ground and with the draw hoe take out trenches half-an-inch in depth and along the side of the lins which is used as a guile.
( $j$ ) After all the trenches have bsen taken out, sow the Onion ceed, thinly and evenly.
(g) With the back of the rake, fill in the $t$ eaches, beating down the soil lightly with the samp.
(h) Rake the ground smooth along the lines (not across them), so that no clods or stones may obstruct the germiation of the seeds.

## 3. Sowing Pene

(a) Ascertain the height of the Peas to bo nown, and if it bo 3 ft , mark off the ground in lines at, leest 21 fL . wisth
(b) Stretch a line from pes to peg along the groutad, and wittia draw-hoe take out trenches 3 in. deep.
(d) Sow the Pea evenly and moderately thickly along the trenches.
(d) With the rake, fll in the trenches till the soil forms a slight ridge above the Peas. Leave the soil rough, as raking is unneceseary with this crop.

## 4. Sowing Beang.

(a) Peg oft the ground in lines 2 ft . to 3 ft . apart, accordiag to the height of the Beans to be sown.
(b) Take out trenches 3 in, deep, and the Enll width of the hoe.
(c) Sow on plant the Beane in a double row, placing the oeeds 6 in. apart in the lines, and alternately with those of the companion line.

## demonstration v.

propagation of plants

1. Meking cuttings.
(a) Make cuttings of Gooseberries of young eboots of medium atreagth and 12 in . to 14 in . long. If longer than this, reduce them by cuttiog off a part of the apex.
(b) Carefully cat away or remove all the buds except four at the upper end. This will prevent suckers, and secure a cleen stem.
(c) Prepare outtings of Red and White Curranta precisely in the same way.
(d) Make cuttings of Black Currants about 12 in . in length. None of the buds should be remored, as suckers in this oase are deeirable.
(e) Plant the cuttings in trenches, covering them to a depth of 5 in.o. and tread the soil firmly against them.
( $f$ ) Make outtings of Carnatione and Pinks, each 2 in . to 3 in. long.
(g) Out them horizontally, immediataly beneath a joint, with s sharp knife.
(h) Remove the Lower pair or two of leaves, and slightly shorten the rest if they are very long.
(i) Trest Polargoniums in the same way; they may, however, vary from 2 id . to 5 in , in length.
(j) Remove Rose cuttings with a small heel of the old wood.
(i) For planting outside, they should be 9 in . to 10 in , long. Remove the lower leaves, but not any of the buds.
( $l$ ) Insert them in treaches 4 in. apart, and in lines 12 in . (l) Insert them in treaches 4 in
asunder, to leave room for hoeing.
asunder, to leave room for hoeing.
$(m)$ Put the bise of the cuttiogs 8 in. below the surface; $c$ ver with soil and tread firmly.
(n) For insertion in pots under g'ass or in a hothouse, the cuttings need only be 3 in , to 5 in 。 long.
2. Badding.
(a) Bud hoses a little below the surface of the soil, in the ase of bushes; and as near the main stem as possible, in the case of bushes; a
(b) Male a transverse cut through the bark with the budding(b) Make a transverse cut through the bark w.
knife, and a longitudinal one about 3 in. Jong.
(c) Prepare the bud by inserting the knife a little above it, paseing downwards and outwards till a piece of wood and bark sa inch in leng $h$ is removed.
(t) Cat off the leef retaining the petiofo. Oarefully remove the wood from the bark, retaining the core of the bud in all cases.
(e) Lift the bariz of the rtock with the thin end of the handle of the budding-knife, and slip in the bud beneath the bark so lifted.

All these operations should be done as quickly as poskible, to prevent injury to the cambium layer by exposure to the sir.
(g) Bind up the inserted bud with raffia, oorering all except the bad.
3. Grafting.
(a) Graft Apple, Pear, and other fruit trees about 3 in. above the eoil, except in special cases whers it in convenient of neces. sary to work the trees at a higher level.
(b) For aplice-grafting, cut both stock and scion in a slanting or oblique direction, so that the latter will exactly cover the cut surface of the former. The object is to make the cambium layer of both to coincide.
(c) In the oase of tongue-grafting, make a notch or a deeper slit in the stock, with a tongue in the scion to correspond to the same.
(d) When perfectly fitted, insert the tongue in the notch end bind stock and scion firmly together witb a piece of raffia, (e) Where triangular notch-grafting is intended, take out a Lriangalar groove in the atock, narrowing the notch to a point at the lower end.
(f) Cat the seion so that it will accurately fit the groova in the atock.
(g) Inert it, and tie up firmiy with raflis.
(h) Cover the grafte with grafting clay, and that again with

Moes to verp out drought.

## 4. Layeriag Carnations and Shrubs.

(a) Make up a compost of sandy wik son leat moould, and (b) Remore of it around the Carnations to be layered.
(b) Remove the lower lesves of the shoots to be layered
(c) Pase the blade of the knife inwards at a node, and upwards for half-an-inch or thereby, being careful not to sever the shoot from the parent plant.
(d) Peg down the shouts, keeping the tongue or cut open. (e) Cover the layered portions of the shoots with the compost, and give a good watering with the rosed wateringpot to settle the soil, Repeat the watering in $d r y$ westher until the layers are rooted.

[^32]
## I T A L Y.

(Concluded from page 325.)
Flower.carpets.-In Torre-del-Greco in celebrated every year during the month of June s religious feativity called the "Quattro Altari" (Four Altars), when, amongat it principal attraccions are to be seen the mo-called tappeti di fiori, or flower carpets. On the floor of the charchen occupying a pace which measures 45 by 40 feet, thene carpets are formed. This year there were five of them, representing, "Tobias's Departure," "Thomas of Aquino," who compiled the Liturgy of the Sacrament; "Jesus rescuing Peter on the Waters," "Naomi and her atep-daughter."
For the formation of these really artiatic carpets, which formed the admiration of all who saw them for the first time, the material employed is cut flowers or their petals, coloured and, and saw-duat. Could not such "carpets" be introduced by fashion in garden parties, or any such worldly amusements, using ecular subjects? We think that they would be a great success. [We hope not. Ed.]
At the Naplea flower-show a similar carpet has been greatly admired. It was of rich design, and contained in the centre the royal arms. It was composed with the produce of the vegetal realm, and the flowera montly employed were Dahlias, Pinks, Asters, Dalphiniums, fraits of Ailanthas, and dust of burnt Vine and dried Chestnat leaves. The green of its border conaisted of leaven either entire or minutely cut. The gardener, di Cristi, who had created this carpet was highly complimented,

## Cannag.

About the middle of the long aisle, the numerous vinitors atopped admiringly before the gorgeous ahow of Cannas presented by Mearrs. Dammann \& Co, of San Giovanni-a-Teduccio. No worda can exprem the beauty of the new varieties. How far behind are left the poor Cannas with amall flowers and atiff petale compared with these Cannas both as regard their vigoron growth and the size of their flowers : The label indicated "new varieties of Orchid-flowering Cannas," and, in fact, the large flower outrivale and nometimes aurpases the largest tropical Orchids.
The strong and compact spiken of the variety Austria are covered with enormous flowers, attaining a diameter of 6 inches and more; the yellow-apotted thront of which, and pale-red petals bordered with yellow, prement, against the mase of foliage, a mont atriking aight.
The Canna Italia is a grand plant exceeding 6 feet in height, with Musa-like leaves and enormous spike of brilliant red fower bordered with yellow. These are two of the mont splendid varieties, which for their beauty, leave varietie like Madame Crozy and other far behind; and yet in future, there will be atill more splendid rarieties such as Allemannior, La France, and others.
The jury interpreting the general admiration, and considering that nothing of the kind had been exhibited before, awarded Mearn. Dammana \& Co, the Diploma of Honour. Dr. G. Mottareale, Portiot, August, 1895.

## The Wegx's Work.

## THE OROEID HOUSES.

By W. H. Whert, Orehid Growar, Burford, Dorking.
CYPRIPEDIUM8. - The prement is a good time to look over the Cypripedinms which occupy the warmest division, and repot thowe that require it. Such plant an C. Stonei, C. Lowi, C. Lawrenceana, C. nelligeram $\times$, . Rothechildianum, C. Cartiof, C. Swanianum, C. Sandernanum $x, C$. barbatum, C. naperciliare $X, C$. Hookerse, \&c., that bloomed during apring and early summer, will by this time have made conviderable growth, and unless any of them are auffering for want of root-room, it will bs adriasble to let them remain nadistarbed until the flowering period is over, but such as have bloomed late, a C. Io grande $\times, \mathrm{C}$. Meanureaianum $\times, \mathrm{C}$. Chamberlainianum, C. radionum $x$, C. Pollettianum $\times$, C. Pariehi, C. 'T. B. Haywood, and thote
of the selenipedium section, may with advantage on repotted or top-dressed as each came may requirn Among varietien now in bloom mention may bo made of C. Maynardi $\times$, C. picturatum $\times$, $C$ orphanum $\times$. C. Harrisianum superbum $\times$, C. Mor ganim $x$, C. Abhburtoniæ $x, C$. Crosoianam $x, C$ purparatum, C. cananthum $x$, and it variety apper bum. As these plants commence to grow very mond after the flowers fade, no delay whould occur a the the flowers are past in repotting or aurface-drestion them. It is now a good season to take and prick out young seedling into very amall pots, or to gine more root-room to those that were taken of lix spring; if the work be done at once, they will become well established before winter. When repoting Cypripediams, it is not necessary to raine them above the rim of the pot, therefore keep the compon jast below it so as to render watering eary. The pots used chould be well drained, and the compors may consist of rough fibry peat and cless piched sphagnum in about equal parta, adding some broken piece of brick or crock to keep the noil free and porous. When well rooted there plants mas bo almost delaged with water the whole year round, but they must be carefully protected from strong ammbite at all times.

Cattleya-hoube, - In the Cattleya-bome, Cattleya Bowringiana, C. Alexandrw, and the autamn- -lowering varietie of C. labiata, are shomo ing their bloom-apiken, and will require afficient water to keep the roote moirt, but not wet, until the flowers open, when it must be gradually discontinued, Although the weather during the pati summer hus been exceptionally hot, there are still some plantsof Lælis parparata, L. tenebrosa, Cattleya crispa, and C. lobata, with growthe only a few inches high, and fortunately they appear very mach atronger than those which atarted earlier. As these growth will moon commence to make new roots, the plants inould be examined to find out if they require moreroot-1puc. In every case the roots bould have anfficient apece to grow inside the pot, therefore when re-potting, allow room for two season' growth. Daring the growing period the plants ehould be placed in the lightest ponition in the Cattleya-house, and miter very carefully afforded as recommended in former Calendars for others of the same gena. Some of the spring-flowering Cattleyas, as C. Trianmi and C. Mendeli, have completed their growth, also C. gigu, C. Eldorado, C. Hardyana, C. Manaiana, C. Dowiana, and it beautiful variety aurea, these will conat quently require less water at the root, sed all the anlight poasible, so that the nemilyformed balbe may become properly matured. The prement is a critical time with many Cattlepu and Leslian, and the grower hould look ores them every day, enpecially when the weather it dull and damp. He will probably notice that the outer wheath which encircles the preado-bulb, eapecially at it base, will be soft and sappy, clinging so tightly to the bulb as to prevent the ingrem of air, which is frequently a cause of decas. Should this occar, slit open the sheath from top to bottom, and keep the plants dry at the root for a few days, and at the ame time reduce the amonnt of atmopheric moisture. When on opening the shentio it is found that the bulb has already commenced to tarn black, the affected part ahould immediately be cat off, or the plant may die altogether. To prevent uch decay occurring, careful ventilation, with pleatj of sun*hine, is necensary.

## FRUITS UNDME GLASB.

## By hrowand Pancen, Gardoner, Goodwood, Chichuter. <br> PINES.-Suckere which were put into 6-inch

 pote last month, and planged in a bottom-hest of $80^{\circ}$, hould now have a niee lot of roota. Do no pot these on at this season, as growth made duripg the winter month is alway weak. Keep the jomph stoek as quiet as possible until the apring, when, wist lengthening days, growth will be both atroig tid rapid; only anficient water thould be afforded keep the bulb fairly moist. The planging metand should be kept well up to the rim of the potstant quite firm. It in not wise to shift the plants of of than is really necesary, as there is danger of check occurring, whicb may cause the plants to pives duce fruit prematurely. If the plantican be given a teady bottom-heat of $65^{\circ}$ to $70^{\circ}$, and pleary light, it would be as well not to disturb them Jip the apring. Shading of all kind should dowe pensed with at once, if this is not already and Take advantage of bright sunsbine to remove aidwell wash the roof-lights, wo that an much light as possible mayreach the plants. Continue to ventilate daily toong as the weather is mild and bright, and the floor may be damped averal time during the day. cient, and $75^{\circ}$ by day with ann-heat. Queens intended to truit next pring will have tlled their pote with roots, and whould be prepared for a season'u rest, by gradually reducing the temperatare of the house, and affording less water at the roots. If the plants are not carefully prepared in this way, they will fail to throw up good fraits when required. See that the planging material is made firm, and keps well up to the rim of the pots, as this tend to keep the noil moist and arve watering. Ventilation and temperature hould be the ame for there as advised for the young stock. Such varieties as amooth Cayennea and C. Rothachild which are welling frait, must be given plenty of heat and moistare. Utilise an-heat an much a ponsible, and ventilate bat little. Continue to feed the plant with gaano, or other atimulant. If the mackers on these plants have become large, they may be taken off at once, potted into 6 -inch pots, and planged in a brisk bottom heat; but should they be small, it would be better to reduce the follage on the old plant, and allow them to grow on until spring.

CUCUMBERS have improved wonderfully aince they were planted at the beginning of the month. All fruit ard male flowers should be kept pinched off, until the fruit is really required. Surface-dress the border slightly at leat once a week, at this keeps the roote from going down into the dung. Stopping and tying of the shoot must receive daily attention. Syringing thould now be done on bright morningy, about 9 A M., and again about 230 P.M. Ventilate cautiouely, as the least draught may give a serious check. The night temperature munt not fall below $70^{\circ}$, or mildew may appear. Keep a harp look out for green-fly or thrip, and check either at once by fumigating. If the floora and bare apaces are damped down at night with manure-water, it will assist in keeping the foliage free from these peata.

## THE FLOWER GARDEN.

By Batuex Wadds, Gardener, Birdsall Gardens, Fork. beodina planta-Preparatious should now be made for housing plants which require to be protected during winter. October frost frequently occur very addenly, and many varietien of beddiog. plants are then unsafe out of doors. Pelargoniums will sustain a few degrees without injury, but Lobelia of the Erinus section, Irenines, Colean, Alterasntheras, and some varieties of Pelargoniums, abould be lifted and boxed or potted at once, and placed for a time in close-ahaded pity or frames until they have commenced to make roots. Pelargonium as a rule are now in a better condition for blooming than they have been all through the nummer, and may be kept tidy as long as possible, but arrangements should be made to bring them in at short notice. Taberons Begonian now in good bloom may be lifted, and placed under glasa if desired; or they may be left in the beds for some time yet, providing the weather continues dry and fine. Dablias usually keep well in the ground until November; if they are blackened by the frost before that time, the top should be cat off 6 inches above the ground. Dahlia Rining Sun is a slendid autumn bedder, and is now a blaze of colour. We bave it round a border of Chryanthemam Madame C. Dengrange, which is now mas of bloom. Autamn-flowering Chryanathemams, Dahlias, and Helianthuses, and are blooming profusely. Bedding Dablias Cloth of Gold and Crimron Queen are excellent for antamn show. Crimeon Queen in about the colour of H. Jacoby. Dahlis Riving San in the colour of John Gibbone.

FALLINQ LEAVE8 will now give additional work. There is nothing more untidy than accumulation of leaven ap to the edgingn of flower or shrub-bede. They should be awept up every day.
arA88 LaWNB ahould be kept clonely mown, and well rolled when mowing is not required. Mowing is beat done is the afternoon at thil eason, there being unually very heavy dow in the morning. Grase edginge of walka and drive may be kept tidy by clipping, as long as the grans continues to grow; and any which have become uneven and weedy may be edged with the grase edging-knife, which will give them a imart arpearance during the
winter. Asphalting of walks with steep gradients if not slready done, should be completed as soon se possible; and walk and road that require fresh gravel on them should be attended to. Before adding the gravel, give a good dresing of weedkiller. Roll the walk and roads well, and compensate for lack of flowers by extra neatnes.

## THE KITCHEN GARDEN

## By Johi Lambert, Gardener, Powis Cautho, Welshpool.

CABBAGE.-It will soon be the proper time to plant Cabbages in the quarters. If the plants have been growing in nursery bede, they will be strong and sturdy, possensing numerons roote. In this garden Cabbagen unally follow an Oaion crop, the ground being cleared of this crop at about the right time. It is not necersary to dig light noils before planting. Plants which come out of nurse-beds, and consequently have compact root-masee, require to be planted with a trowel. I alway dig the land in this garden, having firt afforded it a light dreaning of bone-meal and fresh soot. Lime may be used in the place of soot, but I do not care to apply both at the asame time. The ground should be nicely broken up whilet digging it, and if dry when the job in finithed, it may be trodden evenly all over, and ahallow drills drawn, in which to plant. The drills ahould be about 1 foot apart, and the planta atand at the same diatance, each alternate plant being drawn in the pring for the earliest nee, which will leave the remainder at 2 feet apart. This planting should conaist of early-hearting varieties, uch as Ellam's Early and imilar ones. Afford the plante a good watering if the noil is dry. Cabbage carefully planted with a trowel soon make good plants, stand the winter well, and do not bolt readily.

CAULIFLOWER.-The produce of the reed sown lat month should now be of a proper size for pricking-out in narse-bed. Various method are adopted for keeping Cauliflower plant through the winter, and that of planting in cold frame is, I consider, one of the best. It is well to prick-out Caulifowers twice, first at about 3 inches apart, when, if they are carefully haded and matured, they soon begin to grow. The next remove hould be into the cold frames or handlighte, as the case may be. In frames they should stand at 6 inches or a greater diatance apart. The number put under handlight may vary from five in small one to nine or twelve in larger-sized lights. Keep close for a few days, and then expore the plants fally till froats or heary raina point to the necennity of putting the lights over them. Air mut be admitted at all time when there is no froat. The soil should not be so rich as to favour rank growth. Finely-powdered charcoal, a mall quantity of lime, road-grit, leaf-mould, pent Mashroom-bed manure, and burnt earth, are excellent for mixing with the staple. The latest aucceasion do well noder handglansea. Caulifower plente may also be pricked out at the foot of south walle, and if the winter is not unasually severe, they will survive. Beds may also be provided for them, bending hoop over these to form a support for a covering of bast-mata. Some cultivators sow aeed a little later than the usual date, and keep the plants in pots throughout the winter in a cool well-aired place, planting them out in the apring. Those raised from pring $n$ wings will produce nice head within a ahort time of other which were autumn-sown, that many growers have now ceaned to trouble themselves with antumn-sown plants; and late Broccoli fairly well bridge over the gap between the season of the two kind of plants.

## TEH HARDY FRUIT GARDRE.

## By W. Pope, Gardener, Highelers Cartle, Nawbwry.

8TRAWBERRIES AUTUMN. FRUITING, ETC.-Look
over Strawberry plantations, and cat off all late runners that have tarted since the beda were cleaned. Late bloom is not uncommon this autumb, owing to the premature ripening of the plants during the exceptionally hot weather of the early summer. Any auch late flower should be removed at once, and before the mulching with short rich manure, which should be done at this season. Newly-planted bed may be mimilarly treated, and if thene were planted in good time from the etrongest early runnerm, kept clean, and have been helped by mulchinge, they rill produce the earlient and finest frait. Earls-forced plante which bave been planted frait. give sapply of frait is the matann mat be
effectually protected from birdr, and the trueres of frait should be aupported by forked twign, or other device for keeping the fruit clean and well exposed to the benefit of un and air. If movable span-roof frame are available, they may with advantage be placed over these plants, and if a free admission of air be gived, the frait will be greatly improved. Whatever protection be afforded, it hould bs removed as aoon an the fruit is gathered ; if kept on too long the plants will become weak, and uable to withatand a nevere winter.
autumnal rabpberries. - Autumn - fruiting Rasperries are now ripening, and they require some care to protect them from birds and other enemies. If twine netting be used for protection, select net with a mall meah, mall birds being as troublesome as blackbirds, \&c. The usefulnest of Raspberries in the autumn in so great that the crop is worth considerable trouble to secure. When new canes are planted, a good open nituation should be chosen, and the soil trenched if ponible, and liberally enriched with good rotten manure. Planting hould be done early, the canes being cut down to a few inches of the ground, and well malched with rather long atrawy manare, which is not so liable to be scratched over by bird as short material. When eatablished, the canes mast be cut down annually close to the ground as soon as the fruit in gathered. In the apring, carefully select four or five of the strongeat canes to each atool, cutting away all others. Train the reserved canes thinly to wires, and keep ancker growth under by uning the hoe frequently. The best and most prolific varieties are October Red, Large Monthly, and October Yellow.

## PLANTE UNDER GLABB.

By W. H. Smity, Gardener, West Dean Park, Chichester. WINTER VIOLETB.-Frames should now be made ready for plenting winter blooming Violets. I have tried several method of growing these plants, and by far the best resulte were obtained by planting in frames in which Melons or Cucumbers had been cultivated. These frame or pith are $4 \frac{1}{3}$ feet deep, the wall pigeon-holed all round, the frame itself standing on brick piers. Sach a frame is about 30 feet long, and round it a walled trench $\sim$ feel wide extend for holding atable-litter. Daring severe weather, this in kept filled with fresh atable manure. By this means frost is kept out, and the coil warmed a little, and the plants are kept growing and flowering. The plants should be brought ap close to the glam when planted, and a mall quantity of freah loam and leaf-soil added to that in which the Melons, \&c., grew. The soil should be made very firm round about each plant, no loose woil being left about the neck of the plant. A good roaking of water should be afforded the bed on completing the planting, and a hesvy syringing twice a day in bright weather. The lighte may be left off night and day until signs of front are noticed, when they may be placed over the plants, but tilted unless the frost is sharp. A number of plants may be planted in cold framea, for although they may not give much bloom through the winter, unlese it be very mild, they will flower freely in the apring, and prove very unefal as a succenion to the earlier ones. A few of the bent double varieties for early flowering are Marie Louise, Neapolitan, Lady Hume Campbell, Comte de Brazza, or Swanley White; single are, Victoria (this is by far the best for winter work), Wellaiana, and The Czar. A good hardy double variety for growing outaide is Queen Victoria, which has egormous flowert of very dark blue colour and very fragrant.

MARGUERITE8. - Should any of theae be planted out, a batch of cuttings for flowerivg next apring may be taken. The cuttinge atrize readily in aand soil in cold frames, if kept clone and ahaded daring bright weather. Hhants growing in pota should be
afforded liberal supplies of manarew, water, sid they afforded Liberal supplies of ma
may now be allowed to flower.

SCENTED - LEAVED PELARCONUMB. - Thee plante shoald be taken indoor before the nighte plants cold, any light airy house being euitable for them. Place them clome to the glan, to prevent their being drawn, and afford plenty of plant-food, so sa to keep them green and heelthy.

Chryganthemum Show in Battersea Park. -Information reache u* from the Saperintendent of Battersea Park that the Chryanthemam Show will be open to the public in the Frame Ground in that park, near the Albest Bridge entrance, on and after O es. 5 , between the houre of 10 Am . and dak.
appointments for the ensuing week.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WERK, DRDUCED FROM THE OBSREVATIONS OF FORTY-THREE YEARS. AT CBISWICK. $-54^{\circ} .1$.

The Fruit Show at the Crystal Palace.

The second show of British. grown fraits by the Royal Horticultaral Society, in conjunction with the Crystal Palace Company, was opened on Tharsday last, a ciroumstance that precludes our giving more than a partial report in this issue. The exhibition, so far as we were able to judge at the time of going to press, is a very sucoessful one. There were 180 exhibitors this year in oomparison with 140 last year, and the number of entries in the competitive classes are 1800, as against 1300 in 1894. The quality of the fruits exhibited confirm, as we anticipated, the general opinion that the present season has been a very favourable one for most fruits, and particularly the more important kinds from an economic standpoint. A pples may be regarded as the fruitof the season, and the excellent produce staged by many of the exhibitors is an indication of the quantity and quality of the crop generally. We were not sarpised to find that Pears are not so splendidly represented as was the osse last year; and Grapes though generally in finer oondition, contained nothing of so firstrate quality as the best exhibit of last season. In regard to other fruits and the exbibition generally, it may be said that while in quantity the show is greater than last year, the quality is saperior also.

As Sir T. Lawrences said in his speech after the luncheon, the present exhibition is another proof, if that were necessary, that we are capable of prodacing Apples in this country that are equal in quality to any in the world, and it may be hoped that such a demonstration may still further tend to indace farmers who are now working the land to little profit, or perhaps at a loss, to turn their attention to "varions branches of mall culture," including that of frait-growing. In view of thia, Sit Trevor Lawrences did well to call attention to the sabject of frait-drying, as in great measure, the financial suocess of hardy fruit culture Fill depend upon the adoption of some satisfantory syatem of preserving in years of glat, that part of a crop over and above what is immediately required for consamption. Much of the loas experienced by the present growers, may be attributed to the fact that when fruit of
any partioular kind is unasually abundant, a large amount is allowed to go to waste, because the market prices for the moment will not pay the oost of harvesting and marketing the frait. Sir Trevor Lawrence attributed our backwardness in this country in regard to this matter to the circumstance that herticulturists do not readily combine, and in order to inaugurate a satisfactory system of fruit-drying, it was necessary that some kind of combination among fruitgrowers should be effected for the purpose. Undoubtedly the difficulty in regard to this matter lies here, but, as Sir Trevor Lawrencer added, we hope that gardeners are not so blind to the benefits to be derived from co-operation as to prevent an early application of the principle. There are other points than this, however, to which the grower must give increased attention, in order to compete satisfactorily with imported fruits. We still grow too many varieties for market-work, the harvesting of the fruit is not effected with sufficient care, and the present loose system of packing must give place to more careful methods. There mast be regalar and systematic grading, and everything done to make the frait as attractive as possible.
Reverting to the present exhibition, it is a matter for congratulation that the Royal Horticaltural Sooiety, has established this annual display of British-grown fruits; and especially so, beoanse in conjunction with the exhibition a series of lectures are given upon the subject that are of very great edaoational value. Now that a first-class fruit-show has been established by the one society capable of making it and keeping it a success, we hope that no lack of enthusiasm on the part of exhibitor or appreciation by the public will prevent its inoreased development and usefulness. We must, however, add a word of regret, that we are unable to record a departure from the customary style of displaying the exhibits. We are free to admit that a number of exhibits of Apples in single dishes, or of any other frait in similar classes, admit of a little variety of arrangement, but granting this, surely the collections of numerous varieties might be arranged in some more artistic manner than obtains? Why could they not be shown in such a manner to visitors that they would appeal to them in the same way as does a bouquet or a pioture? This might be easily acoomplished without in any way tending to deteriorate the quality of the fraits, or to prevent acourate oomparison for the purposes of judging.
the rockery at warnham Court, hor8HaM (eee Supplementary Illuatration).-There is no better way of exhibiting the beauties of most alpine plante and others of low growth, than to plant shem on rockerie. The plante are then placed in positions approximating, however diatantly, to those in which they grow in their natural habitats. Their necessitien can likewise be met in the matter of sunlight, or the lack of it, rapid drain ge of the roil, in securing deep crevicas in the dampness of which many specien of alpines succeed without soil of any kind about their root-merely all nodnles of nome kind of stone-limestone or other taking its place, resembling, in this reapect, the epiphytal species of Orchids, Tillandsias, \&c. A rockery admits of the more ready use of a variety of soils, according to the claims of the diferent apecies of plants ; for soils of granitic, limestone, cbalk, sandatone, peaty and loamy nature, than a flat border would render possible; the une of rock, artificial or natural, rendering the separation of the various materiale an eavy matter. There are rockeries
and rockeries, some erring againat every canon of good taste in their conetraction. In the one which is the subject of our illautration, no ambitions attempts, usually abortive, to create an Alpine landscape on flat land, have been made, bat dwarf mases of sandatone, with due regard to stratification in the rocks which appear to protrade from the soil, have been arranged over the area mith singularly good effect. The walka that lead through the rockery are afficient to allow of every plant being examined at close quartern, and the whole merges harmoniously into the sarrounding pleanaregrounds. We hope in an early issue to give a lint of the plants found on the rockery, as well as other particulars of interest to our readers.

The Manchester Botanic Society amo Allotmente. - The following letter from Mrs Broce Findlay appeared in the Manchester Guarima of September 20, 1895:-" Sir, Permit me to bring under the notice of your readers the initiation of a forward movement in relation to this most im portant anbject. It object may be deacribed an one to assiat rural effort in connection with the cultivation of the soil. It is well known that during the lat few years a very large number of perions bave become tenants of small allotment in the neighbourhood of large town. On the 5th of last month Mr. Gladstone, speaking upon this abject, asid: 'There never was a period in the history of this country when rural effort in relation to the noil deserved greater support, and those who render help in this direction are public benefactora.' The Council of this Society propose to hold an annanl exhibition in the Old Trafford Gardens, on a very large acale, of the productions grown by the tenants of amall holdings, at which prizes will be awarded for fruits, Howera, vegetables, poaltry, cheese, butter, \&cc. Prize日 will also be given to the growers of window-plants in our large towns. The counties embraced within the sphere of this effort will be Lancashire, Cheshire, and Derbyshire. We are all familiar with the old asying, that 'the hope of reward sweetens labour; and there can, I think, be no doubt whatever that this special effort will be the means of stimulating the foorer clames of society in their endeavours to excel in prodacing flowers, fruits, and vegetables. The Conncil are of opinion that it is the proper and legitimate work of the Society they represent to introduce and carry ont this project. In order hopefully to inaugurate this important seheme in a comprehensive way, an annual outlay of $£ 200$ will be necessary. To meet this expenditure a apecial fand is being established, and it is hoped that $£ 5,000$ will be raised for this beneficent parpose. It may be added that a donor of $£ 25$ to this fand will become a life member, or be entitled to nominate one. Knowing that the lamented Prince Cossons forty years ago took a lively interest in this sabject, I took the liberty of bringing the matter ander the notice of Her Most Gracions Majesty the Qums, and had the honour of receiving the following reply:-- Balmoral, September 2, 1895. Daar Sir, -I am commanded by the QUBRN to enclose a cheque for $£ 25$, at a àonation towards the purpose referred to in your letter of Augast 21.-I am, dear Sir, yours faithfally, Fleetwood J. Edwards.' Since the receipt of this letter, and as the result of nevernl letters I have written to ladien and gentlemen in. terested in the subject, I am pleased to atate that nearly $£ 1000$ bas been promised. A general appeal will shortly be made to the inhabitants of the districts concerned, together with the list of the donort, and it in hoped that the reault will be commenarate with the importance and beneficence of the under-taking.-Broce Findiay, Royal Botanic Gardens, Manchenter, Saptember 19, 1895."

The bechuana Chiefs at reading.-On Wednenday, September 18, Khazsa and the other South African Chiefa at present in England visited the entablisbment of Mearri, Sutron \& Soss, Seed Merchanta, Reading. The visit had been brought about by the Hon. Eustaci Wriceham Finanes, \&

The Rockery in the Gardens of C. T. Lucas, Esq., at Warnham Court, Horsham.
renident at Earley, near that town. The visitors, with Mr. Willoughbe, arrived at Reading about $10 \mathrm{~A} . \mathrm{m}$. on Wednesday, and were received at the G.W.R. atation by the Hon. Euspace Fienness, Mr. M. H. Sutton (the venerable founder of the firm), Mr. Martin John Sutton and Mr. A. W. Sutton, Mre. A. W. Sutton, and other member of the family, and were driven to the business premises in the Market Place. Here they signed the visitor's book in the usaal form, writing their name: very clearly in English characters. The visitorn were conducted over the various departments, and they also attended the anual 10.30 religions service in the meeting-room on the premisem. After a tour of the Market Place, the party were driven to the varioun marseries and trial-grounds of Memmrs. Sutton in the neighbourhood of the town. Afterward the Chiefn were driven over to Earley, lanching with the Hon. E. W. Fiennes, visiting the Biecuit Factory of Mearre. Palmer, at Reading, before taking their departure.

A Bi-generic Fern Hybrid.-With this, writes Mr. DrUbry, I enclose a frond, one of weveral recently ment me by Mr. E. J. Lowe, of a most remarkable hybrid which he has raised between Scolopendrium vulgare and Ceterach officinaram. In this the joint characters of theme two very dissimilar Ferns are seen too clearly to admit of doubt, though it is somewhat ingular that while the form of the Ceterach frond is so evident in the lower two-thirds, the extremely ecaly character of that species is entirely obliterated by the Scolopendrium parent. The frond sent in the best I have as regards general characters, but in another the sori near the centre of the frond are more clearly seen to be in opposed pairs, affording a mont andoubtable proof of Scolopendriam inflaence. This can be detected in two small sori near the apex of apeciman sent, and it is, moreover, interesting to note how the pinnatifid character of Caterach gradually merges into the simple frond of Scolopendriam which forms the termination. As the venation in both Ferns is dichotomous with free ends, I can detect no particular modification in this respect, except perhaps that in Ceterach there is a clearer indication of a midrib in the pinna. The fractification where not in pair is distinctly that of Aspleniam, with a well-developed indasiam; the porangia perfect themselver, but were all burat when the fronds reached me. I found, however, a few spores, but all appeared irregular in shape and imperfect; it ia doubtful, therefore, if the hybrid will be really fertile. Mr. Britten in his European Ferns, p. 137, figures a presamed hybrid between S. Hemionitis (or S. valgare), and Ceterach officinarum, but this is by no means a clear a case as the one I now bring before your notice, especially in view of the abandance of curious forms that Scolopedrium produces without the aid $o^{f}$ a crose at all, and some of which resemble atrongly the illuatration cited.

Chinese Insect Wax.-At an illuatration of what a State fanction will ometimes do, it is efficially reported from China that the fentivitiea and illamination in connection with the celebration of the wistieth birthday of H. M. the Empress Dowager cansed an increased demand for insect white wax from Fraximus chinensis, which is used for coating tallow candles, and giving them greater consintency, and the export rose from 9133 cwt . in 1893 to $12,934 \mathrm{cwt}$. in 1894 , the price averaging $£ 225$ a ton.

Jules Laverrier.-This eminent writer on agricultural eubjacts died suddenly at Lyons on his Way home after finishing his duties an a member of the jury at the Vienne (Ieère) Agricultaral Exhibition. After leaving the Saulasie School of Agricalture, where he had been mot succeanful at a stadent, he tranalated into his native language a Fariety of foreign works relating to agriculture, Laverarbr went in 1858 to Mexico as Director of Franceol of Agricalture, and on his retarn to France, about thirty years ago, he was appointed Librarian to the Société Nationale d'Agriculture in Pari, a post which he filled for the remainder of
bis life. bis life.

Tragacanth and Perbian Berries in Angora, - Under the name of "Katiera," the white Tragacanth-like game of Cochlospermum Gosaypium, and mome of the pecie of Sterculia, are known in India; and according to a recent consular report from Angora, a similar name, "Kitré," is applied to true tragacanth, furnished by a species of Astragalus. It is said to be known in commerce as fine white Syrian tragacanth, and appears in the usual forms as leaf, or flaky, vermicelli, or worm-like and mixed, or "sorts." It has the appearance of twisted ribbons, is white or reddish, due apparently to the state of the weather, munshiny or cloudy and moist; it is nearly opaque, and slightly ductile, enpecially when fresh. It adaptability in lieu of borax for giving a luntre to starched linen is perhap not generally known. The districte where the shrab in chiefly found are Yozgat, Iskilip, Cesarea, Kaledjik, and Angora. Like the Yellow-berry (Rhamnus infectorias), this plant is also neglected, owing to the falling off in the foreign demand, and though aboudant in the above-mentioned districts, little or no troable is taken by the peasants to collect the gum; this is done by men specially went from other partr. It is found growing wild in the fields, on the roadside, and even in hilly parts. On account of its prickly netare, animals avoid it, but it is frequently gathered by the peasants for fuel. Yellow-berries were formerly an article of export of great value for dyeing parposen. Much labour and expense were at one time bestowed on its culture, but the universal use of chemical dyen has reduced ite demend to less than one-fourth, and its value to one-tenth of what it realised twenty-five years ago, so that now the cost of gathering is barely covered. Cesarea is the principal centre where it is grown.

Cheshunt, Wormley and District Horticultural Mutual Improvement Society.The fortnightly meeting of this nociety was held at Tarnford on Thursday, Sept. 19. There was a good attendance, and Mr. Jason Fears, the secretary of the Hertford Horticultural Society, read an inntructive cultural paper on the Dahlia, concluding with a elect list of varieties. A hearty vote of thanks was accorded the author for his excellent paper.

The Sale of the Stamford House Or-CHIDS.-The collection of Orchids of H. SHAW, Esq., Stamford House, Ashton-under-Lyne, waz aold by Aatingestall \& Hind in their Rooms, Manchenter, on Sept. 19, and upon the whole realised fair prices. Among the chief were Cattleya Mendeli Blanti, which, after mome pirited bidding, realised $£ 9848_{0}$; Lælia elegans Turneri, £27 6s.;"Cattleya Mosniæ Reineckians, £16 16s, and another one, £6 10s.; Cattleya Mendeli Firthi, £5 $10 s$ s ; Lselia Gouldiana, £4 108.; Cattleya Gankelliana alba, £4 48 ; and Odontoglossam crispum, Stamford House variety, £12 12s.

The Sale of W. R. Lee, Esq.'s, Collection of Orchios.- Wm. R. Lee, Esq., Audenshaw, near Manchester, entrusted Mearr. Protherom \& Morris to diepose of the whole of hit collection of Orchids, which comprised many rare and well-grown apecien. It might be as well to give the names of the principal lots over ${ }^{-} 10$ that fell to the hammer of Mr. Protheroe, showing what the best apecies and varieties realised. The white form of Cattleya apecionisaima, called Sanderm, fetched £78 15s.; Cattleya aurea Hardyana, £68 5s.; Cypripediam $\times$ Winnifred Hollington, said to be the only plant in commerce, $£ 73$ 10s.; Cattleya Mosvix Reineckiana, £42; Dendrobium Leeanum, a goodlooking plant of the Phalænopsia type, £42; Cattleva labiata alba, with two bulbe and a growth, £68 58 ; Cattleya Garkelliana, £26 58.; LrelioCattleys Pbobe, £22 1s.; Cypripediam Aylingii, $\begin{array}{ll}£ 23 & 2 s, \text { Cypripediam Leeanum giganteum, } \\ £ 17 & 17 s \text {, Dendrobium atro-violaceum, } £ 18 \text { 18s.; }\end{array}$ £17 17 s, Dendrobium atro-violaceum, £18 18s.;
Cattleya labiata Warneri, $£ 15$ 15s.; Cattleya Cattleya labiata Warneri, £15 15s. C Cattieya dium $\times$ Aubigine, £13 13.; Cypripedium $\times$ Statterianum, £11 11s.; Dend. Falconeri giganteum, £21; Cattleya Triansel, £17 178; and one named
W. R. Lee, £14 148.; Cypripediam innigne, like Sanderæ, £21; Lælio-Cattleya Arnoldiana, £15 15s, and £11 118. ; Dendrobium nobile giganteam W. R. Lee, £13 13s.; Lælio-Cattleya $\times$ Eaterpe, £12 12s.; Pachyntoma Thomsoniana, £11 11s; Dendrobium stratiotes, £10 10s.; Cattleya crispa superbe, £1111s.; and Dendrobiam nobile illustre, mienamed "illustrus," $£ 10$ 10s. None of the plants abovenamed were large, but they were generally in good health. At the second day's sale at Audenshaw, the following price were realised for plant mecified :Cattleya aurea Hardyana, £63; Cattleya Chocoennis alba-maxima, £26 5s.; Cattleya exoniennis, £21; Cattleys Moniæ Reineckiana, £21; Cppripediam $\times$ Aylingii, £21; Dendrobiam plendidissimam Leeanum, £12 12s, and $£ 11$ 11s,; Dendrobiam nobile Hardyanam, £11 11so; Cattleya Gankelliana alba, $£ 11$ 11s, and Cattleya Gaskelliana, Audenohaw var., $£ 16168$. ; Cypripedium insigne of the Sanderæ type, £11 11s. The two days' sale realised about £2000.

Ludlow Chrysanthemum and Fruit SOCIETY's EXHIBITION.-The town of Ladlow intends to hold its first Chrysanthemum Show on Thuraday, Nov. 14 next, which will be supplemented by a competitive now of table-plants, cut flowers, of hardy fraite and vegetables, and Potatos, divided into the unual three categorien-Open, Amateur, and Cottager.

Death of Trees by Sunstroke,-During the late extraordinary warm spell, the writer of thil paragraph was called upon to aee s large Sugar Maple tree that was supposed to have been dentroyed by a leak of the city gas-main at the root; but an examination showed that the tree died, literally, from sunstroke. It is strange that close obervers of trees are uaable to see when anything is out of the common ran of things, and consequently note that something is going wrong. Thi Sugar Maple had been planted on the atreet probably a quarter of a century ago, and wan about 4 feet in circamference; bat the trank was almost triangular, and yet thi peculiarity aeemed to attract no attention. The tree was simply triangular because on three siden of the tree the bark and wood had evidently been destroyed years ago, while the outer bark atill continned to cover up the injury, and the only live wood was on the angles of the trank. Only about onethird of the trunk was practically alive. When the exceedingly warm apell came, it was impossible for these limited ducts to supply the mointure required for auch a large surface of foliage, and the tree, therefore, literally died from inability to furnish the moisture required for tranopiration. It may be alway taken for graated, that when the trunk of a tree, naturally cylindrical, taken an angular form, there is something wrong beneath the bark, and an examination should at once be made. The flatter portions will uaually be found dead. In this case, the bark should wholly be cut away from the dead portion, and the denuded part painted, in order to check rotting away. In time, the healthy wood may grow over the wound or lifelesi part, and the life of the tree be eventually saved. Meehane' Monthly for August.

Botany and the American Government.Under the title of "The Botanical Work of the Government," Mr. J. M. Coultes given in tha Botanical Gazette for Jane a briel sketch of the work of the U.S. Department of Agriculture. There are four divisione. That of Botany, nuder Mr. F. V. Coville and seven assistants, includes, benide more purely cientific work, the investigation: of weede, of poisonour and medicinal plants, and the tenting of seeds; 38,600 dola, was appropriated for its use in the past jear. The divioion of Vegetable Phyaiology and Pathology, with Mr. B. T. GalioWay as chief, finde work for as many as ten amistants. Potato disease, diseases of fruits and cereale, and the anatomy of galle, are among the subject to which attention in now being given. The appropriation for the year ending June 30,189 , was 26,100 dole. The division of Agrontology comen into existence with the first of July, an separste
from the division of Botany. It deals with forage plants and grasea, its function being to instract and familiarise the people with the habite and uses of the plants, to investigate their natural history and adaptability to different moils and climates, to introduce promising native and foreign kinds into cultivation, and to identify all grasses and forage planta which may be ant in for the purpone. Profersor Lamson Scribner, its chief, is preparing a handbook of the United Staten grasses. He has two assistants, and the appropriation amoant to 15,000 dole. The Forestry division is under Mr. B. E. Fernow, with four asiatanta. It main work daring the past three years has been the study of the character and value of the woods of "merchantable species." Mr. Fernow has, however, a much more difficult task in hand, namely, the arousing and organiaing public aentiment in favour of a rational forent policy. Mr. Coultar's article brings home the fact that in wome thinge our American cousing have got a long way ahead of un. Natural Science.

## ROTATION OF CROPS FOR THE GARDEN

One of the most exhausting syatems of soil caltivation is that of growing the ame crop year after year on the ame land, and even on the rich virgin voils of America it is now becoming recognised that rotation of crop offers the advantage of distribating the work of planting, cultivating and harveating over a greater period of time, $\mathbf{t o}$ that a amaller force of labour can cultivate and care for more crops in the aggregate than when limited to the ahort season adapted to one crop. The labour on both farm and garden can be utilised to better advantage when a variety of crope is grown than when but one is planted. Dr. Chas. O. Flagg, Director of the Rhode Ialand Agricultaral Experiment Station, has called attention to this fact in the sixth annual Report of the atation.

In the opinion of most gardeners the one thing needful for the uccensfal production of crops in an sbundant apply of stable manure, though of late years the value of artificial fertiliter hat also been recognised.
The growing of profitable crops without the use of some manurial help is not to be thought of. At the wame time it must be remembered that there are other practical and economical method which must be brought into play in the production of cropn.
For example, manaring must atand on the ame level with cultivation, drainage, and rotation of crope. The old-fashioned system of cropping in rotation has, however, by the very force of circumstances been almont entirely superseded both on the farm and in the garden.
The ides that the intelligent arrangement of crops into a rotation increasen the annual pield and helps improve and prenerve the fertility of the ail is not a new one, nor confined to the days of modern horticultare. But if rotetion is followed in the garden it becomea neceseary to have more than one syatem, becaue each gardener muat be guided to a great extent by the requiremente of the family for which he han to provide vegetablen. And the grower for sale has to convider the markets, so that it must frequently happen that some kinds must be produced in large quantities and in untimely measons.

The primary ream for rotation are found in the soil, and the different demand for food which the various crop make upon it, as well as difference in capacity of various plants to collect their food. The woil werven to fiz the plant, and furnishes medium through which it may send it roots for food and moistare, in which capacity it acts as a great ntorehouse ; and the hintory of horticultare, so far so we know it, clearly whow that a fertile soil is one whict hes accumulated within it the renidue of ages of previoun regetation, and that it become infertile ather revidue is exhauted. The dark-coloured oil the the cace, varying in depth according to matter-decaying lesives, to the presance of organic matter-decaying leaves, ateme and roots, with the
decomponing litter from atable manure. This portion of the coil contain by far the larger percentage of plant-food, and is constantly reinforced by whatever fertiliser in applied, by the decay of roota, and falling leaves, \&c.

As plants differ widely in their habit of growth sbove ground, so is there a difference below the arface in the root development. Some have a large mas of fine thread-like roots, which fill the surfacesoil ; others have large fleshy roots, which penetrate deep into the subsoil, and draw their supplien of food from the lower portions of the soil. In this way the deep-rooted plants grow upon supplies entirely beyond the reach of those having a shallow-rooted system; and herein we find a strong reason for the rotation of crops. Larger cropa can be produced by a judicious combination of nhallow and deep-rooted plante. Again, plant vary in their ability to secure a anficient supply of food from the amme aoil. It is well known that the Cabbage tribe will thrive apon land mach too poor to grow a good crop of Onions or Carrote.

The Rothamsted experiments seem to indicate that the Potato in able to avail itself of a less proportion of the nitrogen of the manure supply than almont any other garden crop, and the weight of tubers obtained per acre is consistent in showing how large is the amount of manure required in proportion to the quantity of produce obtained.
Some planty, while having aufficient power to secure an abuadance of certain elements, lack the power to extract the mall quantity of some other ingredient essential to its growth. The white Turnip and Radiahen are a well-known illustration, in that fertilisers or manares containing a relatively large amount of soluble phosphates alway give the bent crops, notwithatanding the fact that these plants are not enpecially rich in their contents of phosporic acid. The Tarnip and other root crope simply have a low power of annimilating phosphoric acid from the soil, and unlema a liberal amount of that element is supplied in a soluble form the crop is lemened.
In rotations, plants which are delicate feeder should be grown when the soil is full of available plant food, and be followed by atrong feeder which will wecure and use food left by the preceding crop. For instance, Potaton may follow Peas, and late Turnipa nacceed Potatos. When any crop is removed from the soil it carrie certain element of fertility with it, and repeated removale of the same crop without manuring will zooner or later exhanat most soils of those elements, so that further cultivation of that crop will be anprofitable. The sorl is said to be worn out. Let that portion of land alone, and very quickly it would grow up to weeds and grass-thus Nature begins the slow process of restoring the ground to a condition of fertility through the growth and decay upon and within the ail of a variety of wild plante. The rank growth of nome of these plante is Nature's contradiction as to the wornout condition of the soil, and prover that the woil is worn out only as relating to the plants requiring the eame element in the ame or about the same proportions. A very intereating illustration of thin fact is to be found in one of the Rothamated experimenta, in which a piece of land exhanated for Wheat-growing has been uncultivated and left to seed itwelf since 1882. At the prewent time (1895) there are found on this portion of land representatives of twenty-one different botanical orders of plants. Thewe are made up of forty-nix genera and fifty-one pecies. The fifty-one specien consist of twenty-two annuals, two biennials, and twenty-teven perennial plante. It is almo a significant fact that grases which are of the ame botanical order of planta wheat, do not fourish so well as those of other orders, also that aeveral legaminous plants have entablished themselven and grow with great rigour, producing flower and seed in abundance. No cultivated leguminous crop has been nown here for the pat mixty yeara certainly.
We learn from this inventigation that the minerals of the soil which are so necesnary to the successful growth of loguminor plauts atill exise in eufficient quantity, whilut the nitrogen which is the ingredien
so enmential for cereal crop ham become exbauted, and therefore the grasmes are poor for lack of nitable food. A good aystem of rotation with thoroagh cultivation would go far toward indefinitely pof. poning the evil day of anprofitable crops.

The same elements serve in the main as food for most horticultaral plant!, but the relative quantitien of each have a wide variation. If 1 ton of each of the following named crops, in the condition in which they are marketed or gathered for home concumption, were taken from the soil, they would remore tho amounts of nitrogen, phosphoric acid, and potal stated in pound in the table. The second portion of the diagram illastrate what would be remoni from the soil by taking away 1 ton of the refue of unsaleable portions of these cropa:-

A comparison of the figures showa that there in considerable variation in the amount of plats-foll abstracted from the soil by the growth of them crops. The quantity of each constituent in the Pew is seen to be very large, but the mineral food of thit crop is largely drawn from the lower part of the noil and aub-soil, while it is able to obtain some conaider able portion of it nitrogen from the atmonpleo through the friendly bacteria which multiply withis the nodule upon the roots. The large mane of roch left to decay within the soil, and that of mont of the unsaleable portion of the crop (the haulm) witic abould be returned to the land, adds to the quantity of organic matter, while the mineral elements ait left near the surface for the ne of other cropl, 10 that, instead of an exhausting crop, Peas and simile leguminous plants, are probably the best renonaing crops which can be grown, and hence hould find place at often an posible in every sound ajstem in rotation, whether on the farm or in the garden. Is connection with the foregoing atatementa, it mis bo observed that Peas and Beank grow more favournbly on garden moils that have recently been challed of limed. These abitances favour the derelopment the pod, and the mataration of the seed. Poinfil msnures and wood-ashes are also extromely holp in the ame direction, and direct experimenta to show that the immediate aupply of potach the root-range of the plant will probably be nooned exhausted than will that of lime.
Crop which draw heavily apon the supply of pow phoric acid in the aoil ihoald be followed by which require but little of this element.
Cultivation and atirring the soil frequently mote the rapid formation of available plation from the supplien of insoluble material in the in th hence hoed crops have an important place Bnow rotation as a mean of increasing fertility. leaved plante favour the development plant-food in the soil by farnishing the condition necensary for nitrification-that is, partial shade sume nil protection from too great heat, while the surfar.
is kept more moist because of less evaporation proted
Narrow-leaved plants do not shade and prote
the soil se do broad-leaved ones. It is also a fact that garden crops vary in the masen of their growth, ame making most of it in the cool weather of autumn and spring, and other only growing daring the heat of ammer. Here we have another important reason for a rotation of crops. J. J. Willis, Harpenden.

## Forestry.

'TREES, SUILS, AND SITIATIUNS.
()Ne of the most frequent iqueries put by intending tree-planters is, "What are the bent treen to plat
will grow in ordinary soil, providing the latter containa nothing of an inimical natare-bat growing and thriving are different terms. Soil, of course, is not the only reguisite for healthy vegetable growth, any more than food is the ouly thing necenary for animale, climate and situation being of equas

## CACTUSDAHLIA <br> "MRS. WILSON NOBLE." -

THR bloom shown in our illatration, fig. 68, wat exbibited by Messra. J. Cheal \& Sons, of Crawley, at the meetings of the Royal Horticultaral Society beld on Tuenday, August 13, and September 5, thil jear; the variety on the later occasion receiving an Award of Merit. The flower exhibits most of the printe characteristic of the modern race of Cactus Dahlias, as is well shown in the illuctration; and the colour is bright aalmon-pink.
on this or that particular moil ?" Answers to this question are usually plentiful enough, and liata of trees which have proved suitable for every typical coil may be found in every work which dealn with arboriculture. The fact neverthelens remain, that nothing is more uncertain than the failure or auccess of any genue or nopecie of tree in any particalar soil, and little short of actual experience, extending over a meries of yearn, enable at to defivitely say that a certain upecies will or will not thrive on a apeciffed nite. Generally speaking, any Kind of plant
importance at enential to success. Providing the latter are suitable, the question of coil becomes of less importance, although it must not be forgotten that soil may greatly modify the effect of climate and situation, and vice versa, especially in regard to froat, aërial moisture and temperature, rainfall, \&c. The pecies of tree tried bas also much to do with theme influences, rome tree being more affected by wil, while with others climate and mituation seem to play the more important part. Our unually imperfect knowledge of the constitaents
of the nubsoil account for a good deal of what appears to be inexplicable. Sudden variation in the lower strata may cause a warm aoil to become and denly cold and wet at a particalar apot, or be the mean of fertility being replaced by poverty, thas checking and retarding growth. All these uncertainties make tree-planting more or less of a apecalation, although in extensive planting operations the occurrence of blank and failures is alway anticipased to some extent, and we are usually satisied if the general resulta are goed. Where individasl trees are particularly wanted, as in the case of an avenue, however, the auccess of a tree, or a few treen, on a certain site, is often an important matter. Nothing apoils the appearance of a short avenue more than a few atanted trees here and there along its line, destroying, an they do, that uniformity which we look for in a regalar deaign. In long avenuew, slight irregularities are inevitable, and do not interfere with the general effect, a cane in point being the Long Walk in Windsor Park, where storm have made frequent gaps, and differences in the size of the trees, due to soil, may also be observed. Most persons, again, have their favourite kind of trees, and when planting, astarally wish them to be represented as much as ponible, whether the soil and situation are nuitable or not. While in mont caves, therefore, species which are evidently not at home may be avoided when planting, or removed when already present, there may be other cases where it may be worth while to take ome trouble in order to overcome unfavourable conditions of noil or situation.
How this may be done depends, of course, upon the conditions which it is desirable to bring about or to remedy, as the case may be. In many instances the situation alone is at fault, either through its cold exposure or inclination to the sua. The native habitat and characteristice of growth of introduced treen require careful consideration-more so, perhapa, than they usually receive. Oar summern are, an a rale, highly favourable to the growth of all kinds of trees; bat our mpringe and autamna are too treacherousand ancertain to enare the aninjured growth of the young shoot in the former, and its proper ripening in the latter season. To this fact alone mach of the non-saccess of our introductions may be traced, as when either of thene conditions repeatedly fail, the free growth and characteristic form of the tree are dentroyed. Mont of the Conifers are shallow rootern, liking plenty of moisture both in the air and toil, providing that in the latter is not atagnant. This is enpecially the case with the genera Picea and Abien, both of which are montly nativen of mountain regiona with cool and moist climates. For wach trees, hot sad dry situations are quite unouited, and on coils of a generally dry nature, cool and hady situations should be given, either on a north slope, or where they are shaded by other tree from the morning and afternoon oun. By reaton of it deeper root system, the genus $\mathbf{A}$ bies is better able to withatand drought and urface drynes. The tendency of the membere of this genas to commence growth before the spring frosts are over, however, rendern a cool situation denirable in thoir cave siso, usles thelter be provided in the shape of aurronnding treen. Pinem, on the other hand, uaually etand drought well, and aucceed on dry, gravelly will, with thorough drainage.

## Ayelioration of the Soil.

Where it is evident that the ail is to blame for the failure of a particular pecie, the question arises as to whether it mechanical, or chemical nature is at fault. If the first-named, the necensary alteration may often be mado by the addition and intermixture of clay, mand, leaf-mould, \&c, with the natural soil, according an tenacity or poronity may be ite predominating feature. Conifern being whallow rootern, the preparation of the woil to \& moderate depth will be wufficient; and if a mall area be dealt with at firat, it can be gradually extended an growth of the necenity for this will be a good indication that, when once thoroughly entablinhed it may bo found to accommodate itwelf fairly well to it will be
roundinge, and further help may be diapensed with. The warmth and moisture of the coil can also be regulated to a great extent by drainage, rough stone drains, a foot or 18 inches below the arface, being sufficient to aërate the soil, and prevent atagation. The chemical nature of the wil is perhapi the most difficult to alter withont going to considerable trouble and expense. Trees often fail because some inimical compound, or an excersive proportion of some element, such as lime, magnesia, iron, or an organic acid, is present, than on account of the absence from the soil of one or more of the necesuary constituents of plant-food.

The excessive proportion of any elemant can be nentralised by the addition of lime or leaf-mould, according as the excess is acid or alkaline in it natare; but as thim in only practicable on a amall ncale, the nitimate result of auch work in rarely eatisfactory. However carefully a patch of soil may be prepared, the roots are sure to push out beyond it, and get into the anfavourable soil beyond. In such casen, it is only waste of time to plant trees which are evidently anaited to the soil, and only a careful choice of specien will have astisfactory reanits.

Both on dry and shallow or on unsuitable soils of any kind, much may be done by malching or topdressing the surface to modify or contract unfavourable conditions. Almost any kind of loamp or leafy soil, old garden refuse, or turf parings will do for this purpose, and if the known preference of the tree for a particular soil can receive attention, mo mach the better. The soil ahould be lightly worked into the surface, but not so much so as to disturb the roots to any great extent. Mulchings of leaf-mould or whort grase are alno uneful in retaining moisture, and improving the mechanical and phyaical condition of the soil. Oa lawns or place where a neat appearance is of consequence, these top-dressings matt be confined to trees whose branches weep the ground, otherwise the lawn will be broken and unnightly. This can be aroided, however, by removing the tarf sad old aurface soil to a depth of a few inches, and replacing the former after ome good, new loam has been added.
There is little doubt that the fremnena and vigour of all apecimen trees might be greatly increased by the timely addition of suitable soils and composts to the surface, instead of leaving them to take their chance of growing, lingering, or dying, A. C. Forbes.

## Nurgery Notes.

MESSRS. T. RIVERS \& SON, SAWBRIDGE. WORTH.
Probably frait gomsip is never indulged in more freely then in the monthe of September and October. The varying condition of noil and climate have raised and depressed our hopes alternately many timen during the seaton, but now the result is no longer the erbject of apeculation or anxiety-the time has eome when congratalations may be offered. Much labour has been lately required to harvest the fruit, and the produce alreedy making itself felt in the frait-room is proef that the proaent weason has been a favourable one-nt least, there are few fruit grower who will be diaposed to complain in regard to it. A week or so ago the visitor might have seen an excellent crop of Apples at the Sawbridgeworth nurseries of Messry. T. Rivers \& Son; and Pears alno, though fewer in number, are a fair average crop, and the frait is good. Plums have not borne anything like the crop they did last season, but then the yield was enormons. Althongh thin in an aspect of these nurneries that may be less interesting than the inspection and stady of the young fruit trees of every description that are being grown for distribution, it is one worthy of remark in pansing, because in a measure it nhow Mr. Rivers' faith in fruit-growing for profit. To the objection of the inveterate grumbler, that aurserymen prodace the trees, attempt to create or foster a market for them, by inducing others to plant them for proft, bat oho find it more
easy to grow trees than their produce at a proakt, Mr. River might say, "But I practise both ; mach of the land that can be spared is planted with treen in ordinary orchard method, for the very parpose of supplying frait for marketing." Mr. Rivers is indeed a market-grower as well as a successful nurseryman and fruit raiser. Another fact the visitor may notice is, that in the matter of varietien, and especially in the case of Plume, thone which have been planted for the above purpore are to a very large extent varieties which have been raised from seed by Mr. River himelf, or his late father.
Tarning from this part of the business to that of fruit-tree raising for distribution, the culture in only auch as might be expected ander the direction of a firm that has been long known for firnt-clan fruit culture, and for extraordinary reault, in the raining of needling varieties of fruit.

Apples being rightly regarded as the mont important of domestic fraits, are grown in very large number. Different formed trees, suitable for orchard cultare, or for the garden, and even the suburban villa garden, abound, and the training they receive, whether the tree are intended for orchard atandard or halfo atandarda, garden pyramids or bushen, or for planting at the foot of walls, as well as the differently trained espalier treen, is such as has been found by long and wide experience to be best, and the young trees look well and healthy. It is hardly needful to nay that all good atandard varieties are included in the collection, but in addition to these there may be seen a good seedling variety named Rivers' Codlin, excellent for cooking parposes, of large size, attractive colour, rich in flavour, and firmer in fleh than Codlins in general. The fruit can be uned from September until December, and the tree ir a good grower. Early Rivers, which is recommended as an improvement apon Lord Suffield, and Rivert' Farly Peach, almont nimilar to Irish Peach, bat rather earlier, may be mentioned.
Pear treen are looking in the best of health; many of the youngeat tree have made quite average. growth, others are little horter, owing to the discouraging character of early summer. Taking the promise at the end of June, however, with the actual facts in September, the result is marprising. The pyramidal system of training is very popular at applied to Pearn, and numerous good examples of thim atyle are noticed, but for many kind no training is more antiafactory than the bush. Amongat an excellent lot of trees intended for walls and espaliert, Cordon looked very fine. In June these treen are looked over, and the more robust shoots atopped to four or five buds, leaving all others intact. Early in October all the shoots are praned down to three eyen. Such is the pruning that Mr. Rivers' har found succemaful. Some of the seedlings raised at this nursery are among the beat kinds in commerce and include Conference, Fertility, Dr. Hogg, Beacon, and Magnate. Dr. Hogg and Beacon require to be double-grafted, bat with this attention they give abundant atisfaction.

Plums can only be placed second in importance to Apples, and the growth upon these', was oven better than that on any of the fruit trees if we except Cherries. Mr. Rivers has raised numerous varietien of Plums, asd all of them are well known for their value. Of densert varietien we need only mention Grand Dake, Late Rivern, Monarch, The Czar, and Early Favourite; and of kitchen varietiel, Earls Prolific, Late Prolific, Sultan, Autumn Compote, Blue Prolific, and Bittern. Early Tranaparant Gage is earlier by about ten dayi than the old Transparent, but fruits of Golden Transparent sud Late Transparent were atill hanging, and lucious rich fruits they were. We were hown'a new variety upon neveral young trees, at prewent without s name. The frait were quite hard, will riper in October, and being like Monarch in appeasance, but longer, the value of this seedling may bo considerable. The flavour is described av good, and the stone very free. Cherrien, we have alresdy remarked, looked atrong and well. All fruit ingide and out has been long gatbered, but mention
deaerven to be made of Early Rivert, a seedling raived by Mr. Rivers, and one of the very best for market, and for a general crop in July, or in orchard-honses a month earlier. Apricots are grown almont exclanively for planting against walls, or as bushe in pots, and an excellent lot of the latter were of slendid appearance.

Peache and Nectariner, an everyone know, receive a large ahare of attention from this firm, and treen of mont kind are prepared for planting in out-of-door positions. Damsons, Rasperries, Qainces, Crabs, Strawberries, Gooseberries, Carrants, and Nats are all looked after, but we must pass from the out-of-door department to orchard-house abjects.

## Fruit Treis in Pots.

If favourable term are used in describing the general condition of the trees outnide, and the nuccess of the methods of culture adopted there, what must one alay when peaking of the orchardhouse trees here? How highly must we praise the pyramidal Peach trees in pots, the Apples and Peara in pota, and the marvellous pot Vines. Here we are dealing with the apecialtie of the firm, and with culture that is frequently imitated, but has never been arpassed in any other place. Let us look at a couple of excellent epan-roofed house fall of pyramidal Peach-treea, really pyramidal in shape, each shoot as regular as if placed, yet as perfect in its way as the old-fashoned pyramidal Azaleas that were trained with such precision. Of courae, the fruit-tree has hoot all quite free of each other, bat the regularity of the growth, and the altogether anique appearance of thone trees from 8 to 11 feet high, must be seen to be believed. Then what cropy they carry! A tree of Salway was still ungathered, the fruits being not yet ripe, and upon this apecimen there were about seven dozen fruits, and of good quality. It may be useful to remark that these trees are potted into two-thirds loam and one-third decomposed manure, and they are afterward top-dresed twice during the season with kiln duts and horse-dropping. None of the trees are rooted through inte the bordern, but they have all a mass of fibrous roots at the top of the pots, attracted there by the arface dresings. These roots are treated as annaal, and if the plant is not to ba repotted the following season, they are taken away, and as much of the top-soil removed an poanible, and freth added. On the otber hand, if the tree is to be repotted, it is taken out of the pot, and the ball reduced by about one-third by a special tool; and unlens it is to be grown on to larger size, it is then put back into the ame pot, which is well cleaned and thoroughly drained. In this way it in remarkable that trees are kept in robust health and capital bearing condition for years and year.s. It is very interesting to view the original plants of many of Mermin. Rivera' seedling Peaches and Nectarines, much as Lord Napier and other that have been in commerce many years, yet the original aeedlings bear freely now in pots. The list of Peaches raised from seed by Mesern. Rivers is far too long to be given here, but we are indebted to this firm for many atandard varietien and the Nectarines, with mame origin, are almot as numerons, and include Rivera' Orange, Spencer, Lord Napier, Stanwick Elruge, Pine-apple, Hamboldt, Albert Victor, and last, but first in importance, Rivern' Early, raised by Mr. T. Francis Rivers, and certificated in 1892. It in said to ripen twenty-one daya before Lord Napier. Already thim variety ha become well distributed, and Mesers. Rivers are preparing an immense atock, as the value of the variety deserven. Trees of all sizen, in pota, of Peaches and Nectarines, and trained in excellent manner as far as they have grown, were noticed. On Applen, Pears, and Plume, we cannot now dwell, but all of them are well done.
A large house of joung Fig trees in pota we would mention in order to recommend this crop to thone who have never tried Figs under mitable condition. There is no more prolific erop, or one which will better repay labour and expenae, providing the frait is liked. Plenty of heat, mointare,
and air, with nome method of restricting the roots, and a simple method of proning, which convists chiefly in thinning the shoots out by removing the leat desirable ones altogether, and a little stopping of groms growth during summer, constitate aatisfactory culture. We have only briefly mentioned the Vines in pots for forcing early next season. When these are seen, the fact that their culture has become pecialiwed here is comprehended at once. It in not tafe to quote figares, but momething like 3000 have been grown this seanod, and the well-ripened, hortjointed, atrong canen tell their own tale, and are their own recommendation. Math more that we might say of this eatablishment must be omitted; our notea are already longer than we had intended.

## METHOD OF VENTILATING TOMATO-HOUSES.

A NEW ventilator, designed by Mr. F. D. Woolf, Severn Nuruery, Shirley, Southampton, for use in early Tomato, Vine, and other houses, in illustrated by the following figures:-

No. 1.

No. :
Fig. 69.-a vemtilator for marly forcing-houbrs.

No. 1 represents the front view of the ventilator when fixed to the hot-water pipe, and shows perforated front 18 by 6 inches, through which heated air passes into the house.
No. 2 represents the back of the ventilator when fixed, and showa an aperture 9 by $2 \frac{1}{3}$ inches, throagh which the cold air pases from No. 3 .
No, 3 has one end fized into the outside wall of the house, from which a brick is removed, the other end passing through the opening at back of ventilator shown in No. 2.
The cold air pasaes through No. 3 from the open into the back of ventilator, and is heated to the temperature of the house before pasaing through the perforated front ahown in No. 1.
The ventilator is made in sections, and can be applied to any exiating house baving a service of hot-water pipes near the front wall of a lean-to and both walle of a epan-roof house.
The patentee, Mr. F. D. Woolf, Severn Narsery, Shirley, Hants, claims that by it use a constant and efficient circulation of warm air can be maintained night and day at all seasons of the year, and that it will prove of great worth es a preventive of dinease in Tomaton.

## ARISTOLOCHIIA ELEGANS IN AFRIOA.

Abistolochis elegans, Maters, wat first dencribed and figured in the Gardeners' Chrowicle ( n . a., xxiv. (1885), p. 301, fig. 64), from a plant cultivated by Mr. William Ball, who introduced it from Brazil. Dr. Masters atater, in the place cited, that the plant is a native of Rio, where it was collected by Glaziou ( $\mathrm{n}, 13,163$ ), whone specimens are in the Kew Herbariam. He also goes on to say:-"It is ningular that, so beantiful a plant, native of woll-known a botanical diatrict, mhould not previounly have been introduced or dencribed."

But it would appear not to be netive of Rio Janeiro, or even of the province of that name, notwithstanding the epecimens in the Kew Herbarlam labelled "Environs of Rio Janeiro." It is now well known that many of Glazion's pecimen labelled thus at Kew are from distant provincea, and mome are from cultivated plantu. Besides Glaziou's apecimens there is one at Kew, undoubtedly of the same apecies, from the distant interior of Brazil. It is labelled: "On the Parana, $26^{\circ}$ to $27^{\circ}$ S. lat., D. Parodi." This was received at Kew early in 1883, but the apecimen being a poor one, wat not recognised by Dr. Mattern, or more probably not seen by him.
Ariatolochia elegans is then, in all probability, at home on the banke of the Parana River, nome 700 or 800 miles wentward of Rio Janeiro. It is true that Parodi's specimen is doubtingly referred to this pecies in the Botanical Magazine ( t .6909 ), but I see no reamon for the doubt.

The most remarkable fact in the history of this plant is to come. A few daya ago Sir John Kirk, who has lately returned from his special mienion to the Niger Protectorate, brought to Kew specimens and seeds of what struck him as a highly-ornamental Aristolochia, which he collected near the landing-place at the mouth of the Bran River, W. Tropical Africp. It was so unlike any Arintolochia in the herbariam from Africa, though from a locality where one would have expected it to have been collected before, that Sir John Kirk was questioned as to the probability of it being introduced. $H_{e}$ replied that it was growing plentifully in the grass, and had every appearance of being indigenous. At'firat it seemed likely that it had been introduced with ballatt from Brazil ; bat if it is a native of the interior only of the latter country, this explanation eeem: hardly sufficient. On the other hand, it is exceedingly unlikely that it is a native of Africa and Western Brazil. There is little doubt that several American plants have reached Weat Africa accidentally, and have become so thoroughly naturalised as to have every appearance of being at home. Is this one? W. Botting Hemeley.

## STRAWBERRIES.

As far at blooming was concerned in these parte, it has been a marvellous year; some of the large Strawberry plantations were more beautiful than usual, and where they were fortanate enough to get rain, there must have been \& paying produce, while in othere, the long drought serionsyy affacted the crop. It was so with my garden, there being no rainfall for weeks, and so the large quantity of blossom set badly, and in most instances, the plants auffered, and the fruit wan deteriorated.

I am induced to make a few remarkr, after reading Mr. G. Wythen' note on the sabject. My soil is a light atony one, resting on gravel, \&c., therefore dry naturally. It aita British Qaeen, and the plant not only grow atrongly, but thin year threw up an immense quantity of flowers, and though owing to the hot dry weather a namber "went blind," still I had a good crop of fairly large deliciously-flavoured fruit, and fine in colour-bat now comes the carious part to notice. Mr. G. Wythes calls the Britiah Queen a late sort, and yet it ripened some of the berries before and equal with the Vicountens Hericart de Thary growing in a bed adjoining, while the latter was not half the size, and of decidedly worse quality. I have dug up the whole bed. I never cared for it never found it equal to some athers, and whall not plant this rariety again. It is over-astimated. Another good Strawberry generally, Vicountens, this year would not grow out, though the fruit was by no means amall; still, the drought and heat had ach an effect, that the pointe were not only not coloured, but absolately dry and hard, and even green in some cases. Still, as it is unally a good bearer of richcoloured, well-flavoured berries, I have left it for another year. Now of Waterloo. Az to ite worth generally, I may any I like it much, and it has done well, the fruit being delicious. One thing I may mention is this: I have known persons able to eat thie variety without the inconvenience that has too often ariaen after partaking of Sir Jowaph

Paxton, Sir Charle Napier, and nome othera. However, this year "Waterloo "was fairly burnt up. It broiled in the san, and was nearly useless. I think it is an uncertain "doer," and want the zoil and wason " juat right," and then, in my opinion, it is diatinct, well worth having, and by its peculiar flavour, "atanda alone." Of thil I have made a fresh bed, and hope for better things next year.

Now I come to another nort, "White Knight." This neem: to be a capricious variety, for Mr. Ban. yard, and ame others, have taken it out of their catalogue as "useless." And yet with me this grew atrongly, bloomed freely, and bore mome very fine, excellent, and well-flavoured berries. Everyone that tasted it wanted more, and I may add that it was quite equal to, if it did not arpass, British Queen. So pleased am I, that I have planted several more rowe. The colour is a light bright vermilion on the munny side, the reat a bluch to clear white, with white fleah. Perhap the reason and ail both suit ; but however that may be, it wan "very good," and early.

Of coarse, for next year I have put in a few plants of Royal Sovereiga, also Laxton's Latest of All, A. F. Barron, and a sort I have generally found worth growing, Sir Charlea Napier, bright, handnome and usefal; and a seedling of mgown, with very ugly berries, bat of excellent flavour. It is covered closely with seeds, and dull in colour, bat with rich red palp. Is a very atrong grower, and hardy, and I like it. My object in writing is to point out that asoil, position, and seasons vary so much, is it not well to try some sorts that even have "a bad name" an delicate growers, and amongat thene are wome of the best, such as British Queen, Dr. Hogg, and with me White Knight? Harrison Weir, Sevenoaks.

## Home Correspondence.

A BUNDAY MORNING AMONG THE WABPS. Oa the afternoon of Saturday, September t, there came ach a raid of wasps (Vespa valgaria) into our Peach-cases, making auch an onslagght on our P'eache and Nectarinew, more enpecially the latter, an almot to threaten their peedy diampearance, that made me resolve when Sunday morning came to gather the fruit. I am almost ashamed to confens that by the time we got there the an was already high in the meridisn, and oar Peach-case very mach more in possession of the enemy than it was the evening before. So firm and multitadinous a footing had they obtained, that it was completely out of the question to attempt to gather fruit with any reasonable degree of afety. There was no time to lose, and it was evident that if any of the fruit was to be saved, the enemy would have to be dislodged. Therefore to this end it occurred to me that I might treat them to a done of "XL All" vaporiser. Two of these famigatorm were procared, lit, put into position, and the house shat ap as closely as we ponibly could. We atood afely outaide, excoedingly interented, watching through the glane the gradual discomfiture and final death in this lethal chamber of thone hostn of wasps. It was curious to note how, when the wanps found there waw nomeflew wildly againat the glase, and finally dropped dead. There were sliso in the houve a number of blue-bottle flies (Calliphors vomitoria). Thene fought againat the nicotine fames mach longer than the wasps, being evidently much stronger or lens sensitive in their respiratory organs. On this point, some entomological reader might kindly throw some light for our edification. Whilst looking on, I observed one of the vaporising-pans was about empty, and beng desirous of continuing the vaporining a little longer, I went in, passed to the far end of the house ( 75 feet), where the bottle containing the ensence of nicotine had been left; by the time I got back and poured some into the pan I had more experience than I cared for of its potency. It got into my nose and throat, and made my eyes ras with water, so that I was only too glad to rash out into the fresh air. Needleas to ang, that after this We gathered the fruit comfortably, nor way it a bit the worse for the vaporiving fumen which had so Combe Abhey, Sept. 13.

FRUIT-TREES ON OUR HOUSE-TOPS, - Yfour recent leader on thim subject recallamany afte portion this direction made through a considerable portion proved so abundantly nuccessful, that I advocated roof culture of frait strongly in many directions as a early means of paying the rent of cottages by cultivating the enlarged areas and improved sites over our heads. For one striking advantage of roof culture is that the most grasping landlord can hardly charge any additional rent of the tenant for clothing his roof with plenty of frait, and thus dorning his property with higher beauty. As you, however, very properly observe, tenant need greater, longer security of tenure and against disturbance, as well as simpler, easier means of obtaining compensation for anexhausted improvements before they can be expected to invest mach money or skill in adding to the value or bearty of other people's property. In most of the raral districts where coarses of lectures have been given on fruit calture, the more intelligent of the working clanses are becoming experts, more or less, in frait, vegetable, and flower-growing. And what with continuationclasses in all directions, in which horticultare and agriculture may be taught and horticaltare adopted, as a subject for praise and pay in all our elementary choole, it may be hoped that every householder or his children will soon be sufficiently taught in the mysteries of plant life and the secrets of successful calture as to be able to make the most and bat of his small holdings, allotment gardens, and housetops. The latter, though so seldom tarned to practical and profitable account, are by no means the least important. It may sarprise some to see vegetables named in connection with roof cultare or clothing. Bat sarely our warmest aspects are admirable for Tomatos, and jast the place to waken them up out of the sleepy disease if anything can do it. And the Aubergines, or Egg-plants, seem coming in at last. Who shall say how soon they may atartle the natives by growing their useful eges of all shapen, colours, sizes on the house-tops. How grand and gorgeous our Marrows and Gjurds would look on our house-topn, while scarlet and other runners would have garland of bsanty, as well as send down bushel of sweet plenty from the ame coign of vantage. Those who have seen and melt the indescribable medleys of fragrance and beaut ranning wild on house-tops from llosen, Honeysuckles, Jasmines, Clematis will hasten to clothe their roof with flowers. Profit, however, may bo githered, as well as pleasare, from $\mathrm{Q}_{\mathrm{a}}$ wers on roofs. Covered with Maréshal Niel or other Tes Roses, sach as G orye, Wm. Allan Richardson, Nipheto" climbing Davoniensi, Howè e, \&j, house tops might be covered and coined into gold. Then as to fruit. Oar roof are so varied in size, so differens in aspect, that the whole of them may be closted with fruite of some nort from the lascions Giape and Fig to the winesome Pium and the acid Morello Cherry. Hardiest for the north and east, tenderest to the south and west. Apples, Pears, Pama, Peachen, Nectarines, Apricote, Giapes, Gooneberries, Carrants, Blackberries may all be mounted and marshalled to good purpose on or over the roofs of our dwelling-houses, factories, stables, cow-sheds, and other baildings. Of coarse, the lower the bailding the nearer the roofs are to the ground, and the easier it is to reach them. Rjof may also be posted so much and no completely in the teeth of the wind that only the hardient plants could grow to mach or any good progreas. But on average roofe, most of our fruit grow to profit, certainly into verdure and beauty. Certain cantions, however, are needfal to command succeas. Carefal selection of varietie for localities, and for house-top sites. Skilful preparation of atitable root-rang. Tae raining of the trees from 6 inches to a foot clear of the roof, 9 inches is a good average. Otherwise during scorching hot days on house-tops. leaves and fruits alike will often be scorched. Pears, Figs, Grapes, Plame, are particularly liable to this on summer and antumn days, without a speck of cloud from dawn to dark. There iv yet one more danger, and that is from catting draughts on house-tops Oa the sidel or ends of prevailing cold or strong winds a deal or pine shelter should be run ap from the roof to the level of the fruit trees or bushes, flowert, \&s. I observe you advocate protectiun for Fig trees on roofy. My experience is that they are far hardier, afer, more fruitfal without it. The \%aro frots of last Fubruary, and the ad havoc it has made among fine outaide Fige, has not modified my opinion; for my lateat observations show but little difference between the prenent itate

Figs with and without protection through February. Bat what difference there is weam in favour of the out-of-door Figa that have had no protection for years. Our roof and wall Figs in the open under rational treatment, that iz, a starving regimen, suffer lens from the frosts of winter, however severe, than the chills and changes of epring. And everyone will admit that the protected Fig finds itself in a very much worse vital and physical condition to contend with our erratic aprings than the unprotected one, which ham already withstood the winter in the open. D. T. Fish.

THE CHIBWICK VEGETARIAN LUNCHEON. - I notice in the Gardeners' Chronicle, September 14, a menu of a "vegetarian "luncheon given at Chismick at the last meeting of the Royal Horticultural Society. In looking through it, I find such thing as egg, cheese, and batter, not to mention milk and caken. Now I alwaye like to learn, and although I know that somg fowls make better "layers" than othern, and might consequently come under the care of the National Carnation and Picotee Society, atill, will nome one kindly inform me how they (the fowh), cown, and goats flower, and the best way to raine them from seed or cutting. W. M.

DOUBLE DAI8IE8.-The chief cause of the neglect of these hardy flower in spring bedding, is no doubt their average lateness in blooming. Could anyone introduce a variety that wonld begin to bloom from the middle or end of March onward, then a great gain would sealt ; commonly they begin to flower from the middle or end of April, and are unally at their beat during May, that is too late for balbs, most of which bloom in April. No bedding plant for producing a carpet of colour can be better than is the blood red. The Giant White and Mottled are also effective. We can easily have Myosotis dissitillora, our earliest Furget-me-Not, which should alway be raised from seed, in bloom throughout April ; also coloared Primroses, selected early Violas from old plants, Aabrietias, Arabin, Doronicam plantagineum, and mome other pretty hardy thinga, and to have Daisies as month later it annoying. If there were not summer bedding exigencies, it woald matter lest, bu? where thow exiat, then Dainies are too late, A. D. [The plant reverts largely after a few years, if not su much in regard to colour at least in doubleneas ; and althongh
double" frower, the whole of the organe of propagation are not muppressed, hence the plant fill the flower-bed with seedlings which of itelf becrmen in time a nuiarace.

OAK-GALL AND OAK.APPLE.-In latit wel's answers to correspondents it is s:ated that thete terms are syonymous. Of c;arse, an Oas-apple it an Out-gall, yet I venture to think that a diatinction is commonly drawn from a popular point of view. Tias spongy ()ak.gall (produced by Terse terminaliv), sacred to the menory of King Charler, is the the Oak-apple, whereas the hard round gall (prodaced by Cgnip Kollari). which first appeared in thin country about forty yeara ago, is more asually called the Oik-cail, althjugh not unfrequently also deignated () sk-apple. Morenver, there are many native kinds of Obk-galls which would never be calld Osk-applen. Your reply was right, and it was wrong. It all depend apon the nature of the query, or wais was intended thereby. R. McLachlan. [Oar corfepondent's inquiry related to the Oak-apple, as wo thought, but the wording was not too clear on that point. ED
peaches and nectarines on the opeh Wall.-Dring the past few years we have heand much leas than formerly of failares of Peachas and Nectarines on open walla. It is not so long ago the ciy went up, and I believe there were many gana dener of the opinion, that owing to adverse a pach it was not worth the trouble to caltivate the Peach on unprotected garden walle. Whether or not thero was generally in the wouth any reason for this opinen being held, I am enabled to vouch for the correctuen of the atatement that for the last twelve years, worth two or three exceptions, the crops at Merawity of have been exceptionally haary, and the quach trets the fraits good; and, on the whole, the Peach or, in have cropped an well as Pear and Ap le treen, onest fact, as any other kind of fruit grown in gardens. I can see no reason why, with ordang attention, the same should not continue. Ose nain however, is certain; it is of no use dependiag bab old trees for throwing good crops of frait; bided young trees of good varieties, if well alt good to, will afford, ia the majority of yeart, good
resulf. Ia the lem favourable part of the country a full south aspect is necenary, and the latest varieties thould be discarded, the frait not ripening atiefactorily, excepting in warm gardens. Here I may mention we have 420 yards, 210 yards in each atretch, facing ronth-east, and which never gets any an after 2 P.M, and it is from the treen on these walle that the beat fruite are gathered. One of these wall is planted with the trees on the level, and those on the other on a raised border. Tho etrees which are planted on the level border alway do the best, keeping freer from insects, and requiring len water at the root and overhead ayringing-in fact, it in aeldom that water is artificially applied; neither do we mulch the roots with manure, but afford a good aprinkling of poultry-manure, carefully pricking it in during the early apring. This dreasing benefits the trees wonderfully. Thin training is another point of importance which is practised, so that the wood, not being crowded together, gets well ripened. I always diabud very gradually, extending the operation over many week. Very little pruning is required, and the tree suffer no check. Thanka to Memars. Rivert, we have now many good early and late varietien of Peachem and Nectarines, which prolong the eason considerably. The early American varieties have several points in their favour. Waterloo and Hale' Early are very useful fruits; that valuable variety, Rivers' Early York, follow quickly, and Early Lonise ripens at a useful time, while Alice and Condor are not to be deapised. The best of the mid-neason Peachem are Dgmond, Royal George, Stirling Castle, Grosse Mignonne, and Gonhawk. Noblesse, Royal Charlotte, Barrington, Gladatone, and Admirable are usefal to follow these. Of Nectarines, Lord Napier, Elruge, Stanwick, Pine-apple, Humboldt, and Pitmaton Orange are marvels of goodnes. Another early Nectarine, and one which, in my opinion, has a future, is Early Rivers, which ripens about ten days earlier than Lord Napier, which appears to be very free. The fruits are very luncion, and reamble those of Lord Napier. Peach treen require pianty of apace, as will appear when I state that some trees planted eleven yeare ago at 21 feet apart, now cover the entire allotted space and more, some being fully 28 feet acrons. When thene trees had been planted four jeark, I was advised to lift them, but as I was anxiou to get the wails as the trees grew they soon began to fruit with great freedom. That the Peach thrives and produces the beat fruit and keeps freer from insect pents when growing in a firm soil I have had ample proof. It is said by some gardeners no manure should be applied at the time of planting the young trees, bat this depends entirely on the nature of the soil. If it be poor, something should be added to encourage free bat not gross growth. Well-decayed manare hould at all times be incorporated with the soil, but should the loam be somewhat heavy, a lean decayed manure is better together with plenty of lime rubbish. All good caltivators understand the valce of drainage wherever these fruit are grown, and the amount of this ahould always be regulated in ac-
cordance with the nature of the soil. H. Markham, cordance with the nati
Mereworth, Maidstone.

EXTRAORDINARY 8INGLE LEAVEB ON THE Victoria reaia.-From the measuremente given in a recent issue of the Gardeners' Chronicle of leaver of the Victoria Regia in the Royal Butanic Society's Garden, Regent's Park, London, it would appear as though nome of the leavea upon a plant of the amme pecier growing in the Sheffigld Botanic Gurden are still larger. I have never seen a more vigorous plant, or one with finer leaves, the plant is growing is 28 feet in diameter, and even this width is innufficient for the leaves to develop fully, at they get damaged by being mueezed againat the sides of the tank. The surface of the water is entirely covered with leaves; the flower are large and numerona, and at the time of writing there are flower-bud in varions atages of development howing above the surface of the
water. To-day, September 24 , the largeat leaf water. To-day, Soptember 24, the largeat leaf mesarement, with a turned up margin $3 \frac{1}{2}$ inchen high, which given the full measurement of 6 feet $10 \frac{1}{2}$ inchen diameter. The next largent leaf is 7 teet 2 inchen. Then there are three of 7 feet 1 inch, and two of $\%$ feet; two younger leaves, each $6 \frac{1}{3}$ feet, and another $5 \frac{1}{2}$ feet. There are also upon the plant three malier onen. Four leaven have been cut from the plant, each of which meanured
upward of 7 feet in diameter. All the above measaremente were taken inside, withoat calculating the rims, which vary from 3 to 4 inches in depth. William Harrow.

THE CHISWICK TRIAL8.-I can quite underatand "A. D.'s" reluctance to abolith or reduce frivolous and unprodactive "trade" trials at Chiswick, and deal instead with what Mr. W. T. Thiselton I) yer, in his address, calls "fandamental questions," which he considers a noteworthy feature of modern vegetable phyaiology. The occapation of the committeen would in some casen, I fear, be gone. Mr. Thiselton Dyer's paper, of aborbing intereat, reads like a romance; and who knowe but that when "A. D.'s" Committeen rise to the occasion and perform aimilarly interesting and carefal work in the sphere of horticulture, we may yet live to read papert as en tertaining from Chiawick, where the material might, I think, in time be found. At present, many of the deliberations there are, to say the least, "drumlie," and one wonld not wonder if in the re organiaation contemplated by the Council, the committees come, in for some ahare of attention and
admonition. A "wake-up" might do good. We can imagine "the wrangle" over that Bean, and the "purposelens remalt" described by "A. D." The Cacamber pazzle in prospect, I do not expect much from. The fact is, raisers of new varieties of common thing depend largely for trade on their noveltien, and could no more get on without them, than the milliners and dressmakers could without conatantly changing fashions ; bat to prostitute Chiswick as an advertising medium to the businesa, because of "mo many claimant for honours being in the field," is too bad. Chiswick should and could elect and arrange it own work annaally if it chone to try, and hardly ever will keep its expenses within bounds, and its work up to the mark, till it adopts the plan in force in most well-conducted country eatabliahmenta, of forecanting and estimating the work beforehand. Some reatonable proportion, I submit, thould exit between the expense and trouble connected with the so-called "trials" and the realts; bat how does the matter atand? Take the 500 Phloxes, for example : of that number, the bulk, according to a contemporary, was applied by one member of the trade. A fraction of the 500 receivad three and two marks when the committee went over them last year, but the moat of the work
appeara to have been orting out the much larger appeara to have been sorting out the mach larger much alike." Is nuch game worth the powder to any one but the man who sells the plants? I poticed that no sooner had the committee done their work, than a report of it, bald as it wav, was at once prominently appended to the lists of the vendors who encumbered Chiswick with the trials--she partien mainly benefited. Nambers of the vegetables "tried " can only be proved by cooking. Were they teated in that way? If not, the verdict of the committee is not worth anything. Head.
Mi. A. H. AMEE's LETTER.-Permit me to ay that the "heckling" to which Mr. Smee propone to subject the Council on the Chiswick businets may, probably, cut both way, if peraisted in; and I hops, as an outaider, that the Conncil will apeak out without reserve, if forced, no matter what happens. I trust also that everything will be published for the benefit of that maltitude of horticultarists "throughout the country," who, we are told, are consumed with anxiety on the abject, but o which there is no aign, if we except the amall aection who are making all the fuse. Provincial horticultariats of all degrees take bat a languid and canasl interent in Chiswick at present bat they might be indaced to take more ander different circumatances. I am nure also that jou would greatly oblige your numerout readers by telling them precisely what the functions and powers are of the difforent "Coancils," "Boards," and "Committees," which we hear so much about. When Chiswick is reorganised, I hope there will be at least three competent and able men at the head of affair who will know how to conduct the businesy of the Society, and keep meddlers in their proper place. I have never been able to make out how the buninen of the Royal Horticultural Society was conducted but I do know that other businest concerns, involving much vaster interests, depend mainly for their auccens on the chairman, the wecretary, and the manager, with an occasional quoram, and who, while doing their duty, would certainly not brook that dictation from irresponsible Horticultaral Society seem to regard an their apecial
privilege. It in, no doubt, dreadful to think of what may happen if Mr. Smee hould be deprived of judge from Chiswick for local thows. But to reatore his confidence, I would advire him to take s trip to the provincial local shows anywhere, where he will wee the award dealt out bafore a diacriminating public, in a manner above muspicion, whether as regard "local influence" or good judgment. I await the Council' juntification of ite proceeding in regard to Chiswick, and 1 have confidence that it knowa what it is about, and hope it has a good acheme in view. $O$ it one thing I am confident, and that is, that the Council have nothing to fear from the general body of horticultarists throughout the conntry if it acts wisely and fearleasly. At present the reported general agitation and "indignation" is an ntter sham in my belief. Head.

BOUVENIR DE LA MALMAISON CARNATIONB AT EATON HALL, CHESTER.- Being in Cheater a the opportunity of visiting the garden of Eaton Hall. Mr. Barnes, the head gardener, himself kindly conducted us over the more interesting parts of the gardens. Amonget the many fing thing to be seen here we were particularly struck with everal house filled with plants of Souvenir de la Malmaison Carnations; every plant (and there must be several thousanda) was in perfect health-not a aign of disease or any kind of insect to be seen apon them. They are grown principally, Mr. Barnes informed us, to supply cut bloom during the London season. Sach a grand lot of plants as these Carnations were could with difficalty be fonad anywhere else. B. Ashton, Glossop Hall Gardens, Derbyshire.
geedsmen's trade marks.-There in an important point in connection with the need case that came before the Southampton magistrate last week that seem to have eacaped notice, for no reference is to be foand to it in the lengthy reports in the local papera. It is assumed that the plaintiff registered as a trade mark a certain device embodying the words "Shephard'a Kale" as applied to that particular seed, and the Patent Office have taken his money in return for a right, which by virtue of their certificate profesae to give him protection apon all parcele that he diatributes. The Kale gain. in popularity, and local farmers anve their crop for seed, some finding its way into the hands of another seed-distributor atill bearing the oricinal name. Many will asy it is atill Shephard's Kale, and no it may be, bat my contention is that when a trader goe to the expense of controling a specialty sccording to the law, he seems to be quite within his rights to do his atmost to hinder his name being hawked everywhere without some qualification attached that will show the bajer what he is purchaving; if not, what is the use of a regiatered trade mark at all? The need was never in his possestion, the crop may not have had the necessary care beatowed apon it, and although there may be no secret means adopted to keep it true, any one who has had to do with the eeeding of the Bramica tribe know how readily a variety will revert if not planted in a proper ituation, and rogued and re-nelected each season by expertt. To make comparisons of Sanguter's Peas, Wheeler' Imperial Cabbage, and Brown' Monarch S wede, is beside the question altogether, from the fact that the oldfathioned growers who raised thee varietie probably never had any idea of protecting their right under the Trade Marks or any other Act, and an a consequence, their goode are everybody' property. If there is nothing in "selection," will someone kindly tell me why it is the custom with all the beat houses in the trade to eupply what is known as "atock seed" when they require farmers to grow for them? Ask Menars. Carter or Satton if they would
allow any one of the Cabbage tribe to go out for from their private atocks! I have no knopwledge of the partios in this case, but these matters weem to me to require elacidation. Agri-Etorti.

RED-FLOWERED DENDROBIUMG. - I have read with interest Mr. C. Woolford' note at p. 337, with respect to the rare and almost forgotten Dendrobium arachnites, Rchb. f., which I have known ever aince 1887, when it flowered in the collection of Baron Schroder, at The Dall, Egham. Previounly, I had only known it by description. Whether the plant atill exists, and whether others are known, I cannot ay. Fortunately, all the dried material is not locked up in the Reichenbachian herbarium, though it cannot to anid that the species is yet adequately

Enown. Why Mr. Woolford hould have thought I am unacquainted with this species, I cannot imagine. It certainly has not crimson flowers. Reichenbsch called it "cinnabar-red," and anless my memory is at fault, "cinnabar-orange" would have been more etrictly correct. This colour occars in several others, though they are seldom seen in cultivation. My remarks referred to a "crimson-flowered" Dendrobiam, and the colour is repeated in the deacription. The phrase is not applicable to D. arachnites at all, which in colour is about as mach like $D$. sanguineam, a: Lælia cinnabarina in like Broughtonia sanguinea. D. angunineam is the only species yet known to me with blood-red flowers, $R_{1}, A_{0}$ Rolfe.

THE RETIREMENT OF MR. BARRON.-It is mach to be regretted that Mr. Barron's name whould have lately become the mubject of general conversation, and the Council so much censured for what may yet meet with the approval of all well-winhers of horticulture, and those apparently interested in the Royal Horticultural Society. Why all this warmth has been manifested is not quite clear to me. It should be borne in mind that the present Council has enjojed univeral confidence, and brought the Society to a mach better position, both publicly and financially, than at any time previounly, and for which I am grateful, as I think others should likewise be, I have been connected with every one of the Council, either in committee or else in some business capacity, and I therefore repose with all confidence, that when the proper time arrives for them to give an account of their stewardship, they will show how wrong it is to question their integrity; therefore, before a general condemnation is passed, I think it is only right we hould wait patiently for an explanation of their parting with their Superintendent, for in all probability that which is so bitterly complained of may have made the contemplated alterations abolutely necenary, and ultimately prove of great advantage to horticaltare generally. I am not in possession of any cabinet secretw, neither do I desire to shield the guilty of any wrong actions whatever, but it must be plain to all, looking at the useful and important work being done, and the amount of money expended by the County Councils and several colleges in various parts of the country, that our young men emanating from Chiswick and Kew are in great danger of losing prestige and position in the eyes of ladies and gentlemen requiring skilled gardeners. In my opinion, Chiswick should be, without delay, made a college for the highest attainments in horticultare, not only where youths are to be employed and instructed, but where profesional gardeners seeking nitustions shoald be centralised and be usefully employed; and when waiting for appointmente they ahould have the opportunity, daring that time, of atill further practising and seeing the highest clas of gardening carried out. Whenever a gardener is required, he would then be readily found, and a auitable man quickly engaged. It may yet prove that momething of this kind is in contemplation, and if so, I am of the opinion that great good is likely to follow. In my opinion, it is one of the most presaing requirements at the present moment for gardeners when out of ituations, particularly When their discharge is brought about through no faults of their own-that there whould be some horticultural centre for them to go to. Ladies and gentlemen also made aware of their being in readinen could pernonally wee and elect what they required. It pemi to me that Chiswick and Kew are where they might rery conveniently be of courses under wise regulatione I conaider this a project of great importance. At présent, when a gardener through the decease of his employer or other eventualities if under notice to quit, in all proFability he is more often than not 5 or 10 milea away from any town or city, he hesitates where he had better move to, and eventually take the nearest house-to-let. Now all depends apon good lack in advertising and his distant friends; nothing eomes at all aitable; time rolle on, and after awhile he find his hard-earned aavinga gradually dwindling, and in many cases a real good man at last is compelled to accept something quite different to his denervinge and requirementi. He gradually becomes forgotter, and after weelen of inactivity he gete disheartesed and diaguated with the profenion; above-mentioned gurdens neighbourhood of the for this purpone, gardeners womeme on foot of thone requiring gardeners would be within touch oftain requiring them, and would probably soon obtain auitable employment according to their
the Council to establish a kind of Bureau for professional gardeners, ready and capable to undertake the management of either large or mediam-aized places, at once if required, and which would certainly often be a convenience to proprietors. I would gladly double my ubacription, and no doubt many others would do the ame, to enable the Council to organise auch an institution an I have foreshadowed or anggested. It would be a boon to many. I am repeatedly asked for a certain class of man-and time is all important. After writing and commanicating with several men out of place, scattered about, I hear the place is filled, more often than not, by some incompetent person, because the skilled man was not at hand, or could not easily be seen, being so far from London; whereas, if engaged from such an institution, he would have a higher standing, and would also be independent of the narserymen, and would allow him to be far more free as to hin future dealings. Henry Cannell, Swanley.

By an advertisement in the Gardeners Chronicle I notice the Royal Horticultural Society of London is in want of a new Saperintendent, one having a thorough practical and scientific knowledge of all branches of horticulture. Salary $£ 200$ per annum. To an ordinary gardener this amount seems liberal, but to a acientific man I hould alay it is decidedly mall. A scientific education is not obtained without some considerable expense, either to the individual himself or to someone else. Self-taught men of conrse can be had, and men, like most gardenert, can be bad in any quantity to work for the mere love of it. Of the $£ 200, £ 50$ at least would have to go towards the rent of a decent house. There would be rates, taxes, \&c., in addition, leaving leas probably than $£ 150$ to live apon, not mach certainly to maintain a man and family, before the glaring light of a very exacting horticultaral world. Of the two, I hould much rather prefer the retiring-money offered to Mr. Barron, though, as far as yet explained, I fail to see the wisdom of a poor nociety retiring so strong, $n 0$ active, so practical, and wo horticulturally cientific a man as Mr. Barron on £180 a year. It will take the abacription of a good many Guinea Fellowe to make up this aum. Then there is the $£ 200$ for the new man=£380 in all. True, as Mr. Barr alya, there are rich men among the Follows, and one or other of these may come forward and ayy, "We will pay it all," but this much has not yet been offered, and until it has been maid, we are obliged to fall back upon the old proverb, "It is easy to be liberal with other people' money." Had Mr. Barron retired of his own accord, the probability is, they woald not have offered him so mach; nor do we know how much of this is what may be called solatiam or buhb-money, to keep the horticultural world quiet, and to bide the "inner council "over a piece of almost unpardonable work; and this to a man whohas done more, perbaps, than either any inner or outer coancil ever did to keep Caiswick Gardens together-at a time, too, when the Society had almont reached that tage of dismolation known as mors extrema. Mr. Burron's name and personality at that time mas a power in itself, and for any existence the Society now has, it owes to Mr. Barron-at any rate, when the Society' proceeding: were at the lowest ponsible ebb. That is the opinion we gardeners in the country had of it. Why now Mr. Barron ehould be turned out is a conundrum to ub. Well, Mr. Barron will retire with all honourr, carrying with him the sympathy and hearty good wishes of his fellow horticulturists; and when he thakes the Chiswick dut from off his feet, and walks out of those gardene, he will have a warm welcome amongot his many horticultural frienda, whether they be acientific or merely common-place practical. It takes all sorts of men to make up even a good-working horticultural community.: From my point of view, I thought a good practical man was what they most wanted at Chiswick. The cience of plant culture and botany is well cared for in the Royal Gardens of Kew with itm handsome national grant of $£ 21,779$ a year. Is the inner Council of the Royal Horticultural Society jealoun of it colomal neighbour? if so, and it perseveres to emulate, it may, in the near future find itself very much in the ponition of the frog in the fable. Mr. Barron induced me to become a Gainea Fellow. I derive no benefit from the Society. True, they ent I was not able of admiasion to their whows, of which I wan not able to svail myelf; and, by-the-by, I also get the Society's Journal of Horticulture, though I never could tee that a paper is mo mach better for being read before a Council than it ir when communicated to un through the mediam of the
many weekly horticultaral periodicals, through which it would reach us sooner, and be more widely diffued, Pity anything should happen to the Society in its preaent anique position, for without it and ita Drill Hall-a place I have never yet seen-what would brought there from wuch people as the Veitches of Chelsea, the Banyards of Kent, the Lainga of Stanstead, the Cannells of Swanley, the Pearano of Nottingham \&cc, amongst nurserymen. Then them are benides a tribe of gardeners locally plasted in and around London. To all these and sundry othern tho Society deals out its Knightian, Banksian and other
Bronze Medals, Certificaten of Merit, Vote of Thank,

To us gardeners in the country far amay, who have not a chance of even a look through the window, the farce is all the same-exceediagly
laughable. W. Miller, Combe Abbey, September 17
late otrawberries.-I have this day (September 22) picked twenty-three full-mized fruita of Vicomtesse Héricart de Thury, equalling in faspour the summer produce. I shall be able to pick agiin about twenty-eight more fraits from plants put ont last year. J. May, The Gardens, The Red Hone, Leatherhead.

## The Herbaceous Border,

## ASTER CORYMBOSUS

THis belongs to the mall-llowered nection; and $s 0$ amall is it that many persons might consider it ax insignificant plant, it being but $\frac{1}{\frac{1}{2}}$ feet high, It in, however, very unefal for mixing with othor flown of a larger and stiffor habit of growth, its aladar aprays lightening up and improving the appaanam of other things. It is a plant of easy calture in the herbaceous border. W. H. Divers.

## Ebitrichiom strictom (p.336).

This plant grows freely here, coming up whew seed was dropped the previous eeason; and, anlike E. nanum, there is not mach fear of loning the plant when once it gets eatablished. It is mad admired for its pretty blue flowers, and is uefal or catting for filling vases-for effect by daylight-whem Myosotir is not obtainable. I may have it under the wrong name, but it was grown at Kew lant remos under thin name, and seed of the plant is also offend for sale by several English firmu. The scent of the flower approaches, in my opinion, that of the Woolruff (Asperala odorata), but it is less powerful. Wi Ho Divers, Belvoir Castle Gardens, Grantham.

## Obtuary.

Hermann Stenaer.-Hermann Stenger, foro merly a familiar figure in the horticultural world, died anddenly at him residence, 33 , Chancellor Bond Weat Dalwich, on Monday, the 23rd inst, ab age of aixty-meven years. A native of Erfurt, old of the principal contres of the nursery and nem induatrien in Germany, Stenger came to this coumty apwards of forty yearn ago, and firat took nerine under Mesmrs. Veitch at Exeter. He was aben sequently traveller for Messars. Veitch at Cbeaum and then for Messrs. Henderson of the Pine-applo Place. For a short time he was associated in parto nership with Mr. Herbst at the Kew Road Narlerian Richmond. Following apon this, he becamel, manager of Mears. Jamen Carter \& Co's nurn yens at Foreat Hill, and afterwards, aboat twenty ago, he entered the wervice of Meara. Co , reprenenting that firm in thir country, Buis after four or five years' service, the wlow pardim that had been coming for some time, render filas quite helpless in the legw, and for the lar imite year, or thereabouts, his travelling has boon, he wis to a wheel-chair. In apite of his affliction health, and, thankn to the great liberality of Mouts. Vilmorin, he ended his day in comparative comath

## SOCIETIES.

## ROYAL HORTIOULTURAL.

Great Exhibition of Britibh-qqown Fruit at the Caybtal Palace. September 26, 27, 28.
This Show was oprutd by the Sheriffi of the City of London, Alderman and Sheriff Samuel, and Sheriff Hand, who drove down to the Palace in State, and were received at noon by Sir Trevor Lawrence, the Preaident of the Royal Horticultaral Society, and memberi of the Council, and condacted over the Exbibition.
A gardenere' Inncheon nabsequently took place in the Grand Saloon, the Preaident of the Society in the chair. The loyal toats were duly honoured, the President referring, amid applanas, to the fact that Her Majesty was a patron of the Society, and took a deep interest in its welfare, as evidenced by the magnificent diaplay of hardy frait from Her Majeaty's gardens. The Preaident, in giving the health of the "Sheriffe of the City of London," asid they were in hopes of having the Lord Mayor present with them that day; bat an they were all aware, hia lordehip had been engaged in an exhauting eerie of enjoyment and dimipation in France. However, in the absence of the Lord Mayor, they were very glad indeed to have the presence of the Sheriffe of the City of London, who had been kind enongh, not only to drive down to the palace, but to do $t 0$ in atate. They all knew what important duties the sheriffe of London discharged, and they were much obliged to the sheriff for being prevent. The senior aheriff (Mr. Samuel) mas member of the Gardener:' Company, and they welcomed him in that capacity, as well as sheriff of London. He believed they had that day shown the Sheriffs anch fruit as they had never aeen before, as he considered a finer collection of hardy fruit had never been tabled in any exhibition in the Kingdom. He need hardly aay how much they were all obliged to gentlemen from all parts of the kingdom who had been kind enough to contribute to the show. He was quite sure that the importance of fruit cultivation in this country would receive a very conniderable fillip from the how. He thought in this conntry hardy fruit which could not bo beaten in any part of the world. Referring to the correspondence which had been going on in the aubject of fruit drying, the Prenident aaid we in this conntry had never done much in that direction; that, however, was partly due to the fact that we did not readily combine for operations of that sort, which needed co-operation rather than individual effort. When there was a glut like there had been during the preaent year, and when there was a difficulty to find a profitable market for even good samplea of fruit, it woald be a great advantage if the surplus fruit could be dried, if only for domestic consumption. Recently there had been atatements made about the quantity of butter imported to this country, reprerenting about $£ 10,000,000$ annually. Whatever could be said about fruit-drying, there was no doubt What we could produce batter of the highest quality. When farming was no precarious, it did not say much for the farming classes if they could not compete with the foreigner in the matter of butter.
Alderman and Sheriff Samuel reaponded. He maid that, in juatice to their civil chief, he must tell them that his lordahip was that day attending meeting of the Court of Common Council, and he wan quite are when the Lord Mayor heard of the reception that had been accorded to the wheriffi, he would regret, as mach aa they all did, that he wae unable to be present with them. The City of London had always, by their guilda, taken a deep intereat in anything that could tend to the apremacy and the welfare of the country at large. It way one of the mont pleasant functions of the sheriffs to attend on auch occasions an the prenent to tentify by their presence how much they deaired to nee Britimh induatries flourith.
Sheriff Hsad propowed the Royal Horticultural Society. He dwelt upon the growth of the society, and anid there wae no knowing what would be the result of the next twenty-Give yeara' work if even only one half of the 3,500 Fellows did their level Thent.
The Preaident reaponded. He anid the Socioty Wedged hantiafactory condition, and win the scknow-

Kingdom. He bore testimony to the excellent work done by all concerned, especially mentioning the valuable services rendered by their Assistant-Secretary, Mr. John Weathert, in the regrettable absence through illness of their Socretary, the Rev. W. Wilken. The President thanked the authoritio of the Crystal Palace for their efforts to make the show a success, which he sincerely hoped it would be financially, and otherwise.
The Prenident next gave the toast of "The Jadges," and thanked those gentlemen for all they had so kindly done.
Mr, Dann, gardener to the Dake of Baccleuch, esponded.
Mr. Pearson, of Chilwell, proposed the toast of "The Press - Horticultural and General." Mr. Barnes, Standard, responded; and the proceedings. ended.

The Show.
The schedule is divided as follows: Division I. containing seventeen classey, for fruite grown under glase or otherwise, open to all. Division II.. inclading aix clasas, open to nurserymen only. Division III., containing twenty-eight classen, for fraits grown in the open air, open to gardeners and amateur only. Division IV., containing sixty-four claseen, for single dishes of fruit grown in the open air (amateurs and gardeners only). Divioion V., containing five classes for dried fraits, not preserved in fluid or augar, the fruit to Division VI. containing six classes, for which special prize were offered. Below we give a report of the first three of theas diviaions, and the other three, together with important exhibits by the trade, muat be deferred until next meek.

Division 1.
Fruits Grown under Glass or otherwise, oper.
The leading class in this open division was one arranged for a collection of twelve diahes of ripe fruit, not fewer than six kinds, nor more than two varieties of a kiud. Three exhibitors contended for honour here, and the successful one in obtaining lst prize was Mr. J. McIndoe, gr, to Sir Josepr Pease, Bt., M.P.' Hutton Hall, Guisborough,
Yorks. His three bunches of Foster's Seedling Grapes and Yorss. His three bunchos of Foster's Seedling Grapes and maston Duchess, and Dorennê Boussoch aimirable; Peaches, Golden Esgle and Exquisite, excellent in colour and size exeopting one, perhaps. in the dish of Exquifite, .hish
was not quite equal. Yollow Magnum Bonum Plums and was not quite equal. Yellow Magnum Bonum Plums and
Bryanston Green Gage were good; Figs (Brown Turkey) very good; and apple (Gascoigoe's scarlet) and Melon (Yorkshire Beanty) completed the collection.
The 2nd prize was taken by O. E. KEYSER, Esq.. Stanmore, Who had Black Alicante and Muscat of Alexandria Grapes, Victoria and Pineapple Nectarines, Thames Banly, and Sea Eagle Peaches, Brown Turkey Figs, a zeedliog Melon, and Hero of Lockinge Melon, a d a Ripley Queen Pine weighing 6 lb .10 oz . Plums: Golden Drop, and Pear Beurré Hardy, 6 lb .10 oz. Plums, Golden Drop, and Pear Beurre Hardy,
completed the exhibit, which wal good in general quality, completed the exhibit, which
Mr. Goodacre, gr. to the Earl of Habrineton, Elvaston Castle, Derby, was 3nd, and his fruits were of no mean quality. The collection of eight dishes, inoluding four kinds, and not more than two varietios of a kind-Pines excluded-was very well won by Mr. Aco. Regnolds, gr. to Messrs. de Rotriscimud, Gunnermbury Park, Acton, Middlesex, Gros Maroc Grapes with largo well-colourad berries, Musont of Alexand ris fairly good, but with a fow bad berries; capital Sea Eigle and Thames Bank Pesches, Pine-apple Nectarines, Sutton's al Melon, Ribeton Pippin Apples, and rather poor Coe's Golden Drop Plums wero included. Mr. F. Harris, Rr, to Lady F. Someriser. Ledbury, took 2nd position, in whose exhibit we remarked very commendable Gros Maroe Grapes, capital Golden Drop Plums, Pine-apple Nectarines, with high colour; and a very fine digh
of Gladstone Pesches. Mr. W. J. Empoon, gr. to Mrs. of Gladstone Pesches. Mr. W.
WINGTIELD, Ampthill, was ard.

## $G_{\text {rapes. }}$

Mr . Goodsore staged thoroughly good, if not extraordinary, Grapes, in the clase forsix distinct kinds, two bunches of each, and well secured first place. His varieties were Lady Downes, Gros Colmar, Musoat of Alezandris, one bunols, capital; Ban baroses, Mrs. Pearion, and Alicante. The only other comapetitor was Mr. Reymolos, and he took 2nd prize for Chasselas Napoleon, Alicante, Trebbiano. Mrs. Pince, Muscat of Alexandria, and Gros Maroc, all of good average quality.
Thres distixat kinds two buwches of each. -This clews was won by Mr. R. Grindrod, gr. to P. J. Priwhips, Req., Whitexceptionally large bunch of Black Alicante, and the berries also good and well coloured; but unfortunately some of the berries had been disfigured by rubbing. Two commendable bunctes of Gron Colmar were included, but the Lady Downes' were poof. Mr. A. Beleher, gr. to sir R. H. Barzutt, Bt. Cranleigh, surrey, was jnd, with moderatoly rood Grapes.
Black Hamburgh, thres bunehat-Mr. Wm. Taylor, Er. to
Borw, Esq., Forest Hill, London, was lat in this olaes C. Bornz, Esq., Forest Hill, London, was lat in thie olaes With modorately sisod buachees, of good quality for the date
of the mencon; 3nd. Mr. W. Merromense, Chilworth Manor. of the macon; Ind, Mr. W. Krroxule, Chilworth Manor,
Bomesy, Enity Srd, J. A. Toye, Enq., Oowly Hoce, Chert: ney (rio, Mo. Xomman). There wape four othlétatribe.

Madresfield Court, three bunches.-Mr. J. Day, gr. to C. J. Massex, Eeq.o Garliestown, won in these cineses, but he was very little before Mr. W. Taylor, gr. to C. Borek. Req.
Forest Hill, who had shorter bunches with much lerger ber Forest Hill, who had shorter bunches with much lerger ber-
ries. 3rd, Mr. J. Gibson. gr. to Earl CowLEy, Ohippenhem. There were four entries.
Gros Maroc, three bumehes.-Mr. J. Gusson won this olaes with very highly-coloured berries, and moderately sized come pact bunches. Mr. DAY was only a little behind him, and the 3rd place was secured by Mr. Newman, gr. to J. A. Tole Efq., Chertsey. There were five other entries.
Alicante, three bunches. - Three well-finished bunches stared by Mr. G. Reymolds, won in this clasa, but very much larger bunches lees pretty, highly coloured, but the berries small were staged by H. TıTE, Kaq., Park Hill, Streatham Common (gr., Mr. W. Howe), and a little disestisfaction was exprosed. The Brd prize treble came from Mr. J. Bury, Byfleet. There wers six other exhibits.
Ary other Black, three bunches.-Three excellent bunches of Mra. Pince (Black Muscat) won in this class, and were staged by Mra. W. Mitchell, Romsey, Hants. The 2nd prize was a warded to Lady Downes, exhibited by C. S. S. Dickers, Feq..
Coolhurst, Hormham, Susear (gr., Mr. A. Kemp); and the 3rd to an exhibit including an enormous bunch of Grosse Grillaume hardly finished, and exhibited by C. Boyer, Esq., Forest Hill (gro, Mr, W Taylor). There were five other exhibito.
Muscat of Alexandria. -The finest buaches in this clars, in which thare were seven entries, came from Mr. W. Tidy, gr. to W. D'ARCY, Rsq., Stanmore. These had fine berries, well finished. Mr. W. Taylor, gr, to alderman Ceapfin Batte, was 2nd with very large bunches, rather wanting fioish, and Mr. Empson, gr. to Mrs. Wingrield, Ampthill, was 3rd with amaller examples.
Any ether whte.-Mr. Taylor, gr. to C. BoyEr, Esq., Forest Hill, was well lst, haring splendid Buckland Sweetwater, the berries showing very fine finieh. Mr. Reynolds, gr. to the Messrs. Rotesichind, Gunnersbury Park, was 2nd with arcollent Chaselas Napoleon; and Mr. Robinson, gr. to W. LawRevier, Eeq., Sittingbourne, was 3rd with Buckland Sweet water.

## Tomitos.

These ware in wonderful form, there bsing ten lots of four varieties, though in some cases the likeness between so-called varieties was too discernible. Mr. Howe, gr. to H. TATE, Eeq., of Streatham Common, was let, with a rather large, but deeply-coloured Trophy, Frogmore selected, Hackwood Park, and Sutton's Perfection; Mr. A. Ryder, Orpington, was 2nd with very handsome Duke of York, Ignotum, Mayflower, and Trophy; Mr. Carbaway, Pulbrook. coming 3rd.
There were sizteen single dishes, Mr. Helman, Lewee, hqving the best in very handoome Polegate; Mr. M. C.
SANDERS, Tring, coming 2nd, with Ham Green Favourite and Mr. Richards, gr. to R. SUnmers, Rsq., Streatham, with Perfection was ard.
The clase for six olusters brought aine lots, of which Mr. J. Gore, Polegate, had the best, in good but not largo ones of that variety; Mr. Wells, gro to F. G. ARBLThiot, Req." Bexley, was 2nd, with the Old Red, oapital clusters ; Mr. J. Hirl, New Malden, being 3rd, with Conference.

Orchard-house Frutts.
There ware four large collections ahown in the clast for hardy fruit. grown partly or entirely to illuatrate orchard-house culture, although the bult seomed to have come from walls or the open. Here Mr. C. Bliok, gr. to M. W. Smith, Eeq., Hayes, was let, with fifty-four dighes of Apples, Pe rs, Peaches, Plums, Nectarines, Cherries, and all very fine. Mf. Potte, 既. to Sif Mare Collett, Sevenoake, was 2nd, also with very fine and somewhat similar fruit; Mr. McIndon, gr. to sir J. PEASE, Guisborough, being 3rd, with forty dishes, all good.

## Diviston II.-Nurserymen Ohiy.

The first prize for a collection of fruit trees bearing fruit in pots in this important clases, was won by Mesars. T. Rivers \& Sors, Sa wridge worth, who staged a magnificent collection of fruit trees in pota. In the centre was a pyramidal tree of Solway Peach which had borne upwards of eighty fruits, but come of which had fallen during transit. Then there ware well grown trees of Apples, includiog Wagener, Cox' Orange Pippin, Beauty of Kent, Peshgood's Nonsuob; Pears, Louise Bonue of Jersey, Parrot, Princem, Conforeace,
St. Lezin, \&k. Grapes, Trebbiano, Golden Queen, Blisok Alicante, Difecteur Tieserard, and White Tokay; besides Peaches, \&c., and other fraits.
Mesars. Geo. Buifyard \& Co., Maidstone, wase lat in the elass 19 for a collection of hardy fruity grown partly or an-
tirely under ales to illuatrats orchard-boves eultary. The collection wase staged on a table, in the eeptre of which whe some fruit trees in pots, carrying crops of good fruit, Applow. Baumann's Red Winter Roinette, Corniah Arometic, and
Rosemary Ruset; Poars, Beurré Suporfin, Madame Lyo Baltet; Figs, Violet Sepor, Brown Turkey, and others; also Poeches, Princes of Wales and Soa Eagle were represented in this manner. On the tables the fruits in dishos were of capital quality, and included Apples, Pears, Orabs, Figs, Peachees, Plums, and Grapes, of very high quality.
Memers. Gro. Bunyapd \& Co. atwo won let honours in the elaes for a collection of not more than 100 distinct varieties of hardy fruite grown in the open. The produce was exhibited in dishen and beskets; in the contro of the larger basketa wass Palm, and the eurface covered with a mound of Apples, while the centre-pieoe consisted of a cone of different coloured $\Delta$ pples, and rurmountod with a Dracman. The Appice, Pearw, and trant genernlly ware arcelleat, and wore etfectivily

Woroester Pearmain，Akera，Duehens of Oldenbargh，Mère de Menage，Lady Sudeley，Duchess＇s Favourite．Colville Ronge， Précoce，and others．
Clase 21 was for a similar collection of hardy fruit，to include not more than five variaties，and the lat prize was taken by Mr．H．BERWICK，Sidmouth Nurserie3，Devon，who staged a magnificent lot of truit．Apples，such as The Queen，Peas－ good＇s Nonsuch，Emperor Alezander，Coz＇s Pomona，Blen－ heim Orange，Cellini Pippin，Biamarck，Golden Noble，Wor－ cester Pearmain，and many others were large and excellently coloured．Pears of Beurré Clairgeau，Louise Bonne of Jersey， Souvenir du Congrès；Peaches，Plams，tc．，were alike good．
The best collection of fifty distinct varieties of Pears was won by Mr．J．Watkins，Pomona Farm Nusseries，Hereford， won by Mr．J．WatkiNS，Pomona Farm Nupseries，Hereford， who did well，considering the more difficult
There than Apples during the present season．
Tive collections in class 23 ，some very fine fruit being staged；and Mesars．Georee Bunyard \＆c Co．，nur－ serymen，Maidstone，were awarded the Silver－gilt Medal for a collection conspicuous for the fneness and finish of the samples，and theix brilliant colour．There were grand fruit of Mere de Ménage，Peagood＇s Nonsuch．Wamer＇s King， Bramley Seedling．Tyler＇s Kernel，Blonheim Orange，Bau－ man＇s Red Winter Reinette，Brabant Bellefleur，Swedish Reinette，Washington，\＆c．

Fruit Grown in the Open Air．
Difigion IIf．－Gardeners and Amateurs Only．
This fcomprised much that had great interest for those interested in Apple and Pear culture in this country．Visitors accustomed to see Apples of Colonial production，were found asking if the grand fruits staged were English－grown，and semed grateful that it was so．Many of the culinary Apples were very fine，and in not a few cases grandly coloured，and a feeling of exultation that such fine specimens were the products of Eiglish gardens was justifiable．
Cudinary and Dessert Apples．－In the class for eighteen dishes，twelve culinary and six dessert，there were eight com－ petitors．Mr．G．Woodward，gr．to Major Warde，Barham Court，Maidstone，was 1st with really superb examples of Tyler＇s Kernel，Lord Derby，Peasgood＇s Nonsuch，Stone＇s， Emperor Alewander，Belle Duboise，Bismarck，Belle Pontoise， Gascoyne＇s Scarlet Seedling，Washington，Mère de Ménage， Warner＇s King，and The Queen；of dessert varieties．Cor＇s Orange Pippin，Baumann＇s Red＂Winter Reinette，Wealthy， Ribston Pippin，King of Pippins and Cornish Aromatic，all grandly coloured，2nd，Mr．Geo．Goldsmith，gr．to E．G． LoDER，Esq．，Horeham，who had very fine Emperor Alexander， Cloria Mundi，Peagood＇s Nonsuch，Lord Derby，Mere de Gioria Mundi，Peagood＇s Monsuch，Lord Derby，Mere de
Ménge，Cox＇in Pomona，Bismarck，Cellini Pippin，very fine； Menage，Cox＇s Pomona，Bismarck，Cellini Pippin，very fine；
and The queen s and of descert varieties，Wealthy，King of and The Queen ；and of desoert varieties，Wealthy，King of
Pippins，Cox＇s Orange Pippin，and Ribston Pippin． 8 ra，Mr． W．King，gr，to J．Colmar，Esq．，Gatton，Reigate，also with With twelpo fruit．
With twelve dinhes，eight cooking and four desoert，there were fourteen competitors，Mr．T．W．Startup，Maidatone， Lard Derby frize with excellent examples of Warner＇s King， Lord Derby，Gascoyne＂s Scarlet Seedling，very fine；Peas Queen．onduch，Beauty of Kent，New Hawthornden，The main，Ribston Pis；and of dessert varieties，Mabbott＇s Pear－ Orange Pippin ；end，Mr．A．T．Krlick，Maidstone，who had of culinary varities，Lord Derby，Peasgood＇s Nonsuch，Bis marck，Graecoyne＇s Scarlet Seedling，Mere de Ménage；and of dessert，Worcester Pearmain，Bibston Pipin and Cos＇ Orange Pippin；3rd，Mr．W．G．Pragnell， Wiwarield Digex，E8q．，Sherborne Castle，gr，to J．K，D． was ehown in this clas．
There were sixteon competitors with nine dishes of apples， six cooking and three dessert．Mr．T．Turton，gr．to J．Hark GREAVES，Esq．，Maiden Erlegh，Reading was 1st，who had，finely－ finished fruit of Emperor Alezander，Mère de Ménage，Peas－ good＇s Nonsuch，Warner＇s King，Cox＇s Pomona，and Loddington Seodring ；and of deseert Apples，Ribston Pippins，King of Pipplas，and Coz＇s Orange Pippins；2nd，Mr．S，H．GoonwI． Warwick．also with capital frult of Peasgood＇s Nonsuch，Coz＇s Pomona，Blonheim Orange，and Yorkehire Beauty；and of demert fruit．Kung of Pippins and Worcester Pearmain；JoJ， Whin Grimdrod，gr．to B．S．Priluspe，Risq，Whitfield，who Ale tery the Peasgood＇s Nonsuch，Mere de Ménage，Emperor Culenter，and Warner＇King．
diblew．Mr．Woodwalid taling the let prize with magnix cent examples of Wamer＇King，Emperor Alexander，Kord Derby， 8 tone＇s，Belle Duboise，and Peasgood＇s Nonsuch．and Mr．S．J．Wright，gr．to C．Lase Campbell，Esq．，Glewstoa Court，Hertfordshire，who had very fine Warner＇s King．Peas－ good＇s Nonsuch，Lord Suffield，Belle Duboise，Lane＇s Prince Albert and Echlinville．3rd，Mr．J．E．Burton，gr．to Sir E． Phľ Back，Twickenham，who had very fine Winter Haw－ thornden，Lord Euffield，Peaegood＇s．Nonsuch，and Emperor Alezander．The best three dishes out of twelve competing collections came from Mr．R．C．SANDERs，gr．at Halton， Tring，who had wonderfully fine Peasgood＇s Nonsuch．Emperor Alezander，and the Queen．2nd，Mr．A．T．Krulick，with very tine Fensgoj＇s Konsuch，Warner＇s King，and one un－ Camed；3nd，Mr．W．Jones，gr．to J．R．Brovgrum，Eeq．e Omakilton．
Desserti Apples．－There were nine entries of six dishes．Mr． Wponwand again being lit，with the and superbly coloured
eazaples of Wuahingtom， examples of Wuahington，Ribitom Rippin，Red Winter Ropyge Précoce；2ud，Mr．G．Gorpsingloley，and Calville Pippin，Xizg of Pippins，G．Goldomuth，with Coz＇s Orange Adiais Rearmain，and Genvenathont Ruset．Riboon Rippiri

hree dishes，Mr．Atkins，gr，to C．S．S．Drckens，Esq．，Hor－ sham．Was 1st out of thirteen competitors，having excellent fruit of Ribaton Pippin，American Mother，and Cor＇s Orange Pippin，all finely finished；2nd，a collection which bore exhibitor＇s name，the varieties King of Pippins，Coz＇s Orange Pippin，and Rib
Dessert Pears．－Some very fine Pears were shown，though they lacked the relative size and finish seen in the Apples； the best aighteen dishes，there being four competitors，came the best eighteen dishes，there being four comperith Congrès，
from Mr．G．Goldsmity，who Souvenir du Duchesse d＇Angouleme，Pitmaston Duchess，General Todleben Sylvestre d＇Automne，Van Mona Leon le Clerc，Princess Beurr Alezander Lucas，Marguerite Marillat，Beurré Diel，Marie Louise d＇Uccle，Louise Bonne of Jersey，Madame Treyve Doyenne Boussouch，Maréchal de la Cour，Bearré Superfin， Doyenne du Comice，and one unnamed．2nd，Mr．WoodWARD also with good fruit of Durondeau，General Todleben，Grosse Calebasse，Pitmaston Duchess，Marguerite Marillat，Emile de Heyst，Fondante Therriott，Marie Benoist，Triomphe Vienne，Beurre Diel，Doyenne Bouss，Princess，\＆c．3rd，Mr Brockworth Park，Reine des Tardive，Princess，dc，Bra，Mr．
gpencer，gr．to H．C．Mortatt，Req．，Goodrich，Hereford－ Spencer，gr．to H．C．Morfatt，Keq．，Goodrich，Hereford
shire，who had fine fruit of Marie Louiee d＇Uccie，Durondeau， Doyenné de Merode，Souvenir du Congrès，and Bearré Bachelier．
There were eight exhibitors of twelve dishes．Mr．Cotterill， gr．to Sir W．GeュR，Tonbridge，was 1st，with good examples of Beurré Clairgean，Gen．Todleben，Fitmaston Duchess，Marie Louise，Maréchal de la Cour，Duchesse d＇Angouleme，Brock－ worth Park，Doyenné du Comice，Beurré Bosc，Beurre Super fin，Gansel＇s Bergamot，Madame Treyve，and Beurré Rance 2ad，Mr．W．Pragnell，with Beurré Clairgeau，Genera Todleben，Pitmaston Duchess，Marie Louise，Louise Bonne of Jersey，Marie Louise d＇Uccle，Beurré Diel，Doyenné du Comice Maréchal de la Cour，Beurré Superfin，and Winter Nelis；3rd， Mr．A．Offer，gr．to J．Warren，Esq，Handcross Park， Crawley．
There were seven exhibitors of nine dishes of Pears，Mr．J Gibson，gr，to Earl Cowler，Chippenham，taking the 1st prize with good fruits of Beurre Clairgean，Duchesse Angouleme，Pitmaston Duchess，Flemish Beauty，Genera Todeben，Triomphe de Vienne，Durondeau，Alezandre Lam bre，and Louise Bonne of Jersey；2nd，Mr．J．E．Buxton，who had Pitmaston Duchese，Flemish Beauty，Brockworth Park Durondeau．Louise Bonne of Jersey，Marie Louise，very fine and Marie Louise d＇Ucele；3rd，Mr．G．W．Jones．
With six dishes there were eight competitors，Mr．W Bawnister taking the 1st prize with Pitmaston Duchess， Madame Treyve，Maréchal de la Cour，Beurré Superfin，Marie Loaise，and Durondeau，all very finely coloured．2nd，Mr． Slogrove，gr．to Mps．Crawford，Reigste，who had Pitmaston Duchess，Doyenné du Comice，Triomphe de Vienne，Brockworth Park，and Doyenné Boussoch．Зrd，Mr．Riokwood．

## ENQUIRIES.

"He that questionath much shall learn mweh."-BAoot.
Canon Teistaan, in his book on Japan, apeake in high praive of a creeping Pyran japonica. What is this? I never heard of it, and it is not mentioned in the Japanese narserymen's liats. $E$.

Lady-Gardeners' Assoclation in the Midlands. - A correapondent deairen the addren of this association. Can any reader kindly furnish it?

* Owing to the large increase in our ofrculation, 108 are reluctantly under the necessity of going to press some hours earlitr. Our contributors, who wall know what this implies, will kindly aid us by sending their communioations as early in the week as possins.
- Playts, Peuter ro me Nuwtd Cormatpontente *- Plants, Frutrs, TTC., To be Nasird.- Oorrespondente semding plants or fruits to be named, or asking questions to obtain an answor to thefr onquiries in the ourrent woeck. Specimens should bs good ones, carenully packod and mumbered, and not more than sixe should be sent at one thme. Locsics only, or Florists varieties oannot, as a rule, bs named.
Abhomeai Flower of Odontoglossun grande: H.C., Surrey. The apecimen ment coneiate of two flowers of Odontoglossam grande joined together on a fasciated stom. Both flowers are perfect. The occurrence is not uncommon, sad plants on which auch abnormal growth taken place are liable to do the like again. In some the peculiarity becomen fixed.
Addense Boos: $\boldsymbol{H}$. \& Son. There are two, one bsing published at the office of the Journal of Horticulture, 171, Fleet Street, E.C., and the other at the office of The Garden, 37, Southampton Street, Btrand, W.C.
Books: Aurst \& Son. Practical Forestry, by A. D. Webster, 2nd edition; published by W. Rider \& Son, Limited, 14, Burtholomew Clone, F.C. Price 5s. Twenty-one illuatrations. A much larger work treating of the scientific, as well an the practical aidea of Forentry, is Dr. Willism Schlich's Manual of Forestry. It in published in three volumes by Mesart. Bradbury, Agnew \& Co., 8,9, and 10, Bouverie Street, E.C. It is well illustrated, and is the atandard work on the anbject. A new edition of Brown's Forester hae also recently been publithed.-Sir C. S., Boynton. Fruit Cultwre, by J. Cheal, contains jutt the kind of information the gardener stands in need of. Publithed by Menars. G. Bell \& Sons, York Street, Covent Garden, w.c.
 premiam would be required. If you have no acquaintance with growern for market, you hould make une of our advertiaing columns. The butinean cannot be learned in leas than as many yaarn an you have been montha in it. "Rsad, mark, learn" hould be your motto.
Carnation: W.J. G. A monetronity known as the Wheat-ear Carnation, often figared in our columne. Ition not ever nocommon.
Dablias: J. Corderoy. The flowers sent are very aingularly marked; indeed we do not remember to have seen any quite like them. It in no anasual occurrence to have flower of disemilar colours on the wame plant in aingle and double-towered varietien, the Dahlia being much given to aporting You may be lucky in reproducing the parti-
coloured varietien from aeed, and fixing their characterm.
Donation.-Mr. A. J. Keen sende postal-order for 2a. 6d. as a donation to the Royal Gardenern' Orphan Eund, which we gladly forward to the eecretary, Mr. A. F. Barron.
Eabit Minoss and Cuetrumas: S. T. K. To deneribe is fall the various practices of caltivators woald occupy too mach of our space, and we would advise you to buy the manaal entitled Cwowber and Melon Culture for Amateure, by W.J. May, poblinhed if the Basaar Otice, 170, Strand, priee 10 .
Fir: L. Deves. The fly in Chlorops scalaris, the

Fur: Live feed in the struw of cereali. R. McL.

Grmasy Bakds for F'but Times: Joo. Cart grease answern very well. It ahould be meared on waterproof paper paseed three or four times round the stem. Brosd band of zinc with the apper part for the opace of an inch bent over at a right angle, if meared in the same manner, are an effectual atop for the wingles mombert of the Winter-moth. Meana thould be taken to prevent the grease ranning on to the bark; and the application of grease mut be renewed occasionally, as it tends to get hard, allowing the mothe to cros the band without hindrance. Pat the bands on early in the next month.
Hobsw-chestnut: $J, D$. Large and coarse thinge have often the prefix "horse" attached to them. The vensels of the lesfotalk are arranged in the form of a horseshoe. The nats are also supposed to be beneficial in ome diseases of the horse.
Inswcts: G.P. 1. The leaves of the Morello appear to be attacked by the grab of a saw-fly. 2. Grabe of the common cockchafer.-Interested. Wireworm are not at all particular an to whether the roote are sonnd or not.
Merons and Cucumbera: \&. T. K. The two varieties you mention of the firat-named fruit are suitable; jou might add the following:-Eastnor Cantle, Erogmore Seedling, Golden Perfection, Ganton Orange, Read's Scarlet-fleah, and The Coantens. Telegraph Cacumber, as yon nay, is excellent, so are Market Favourite, Tender and True, and Allan's Favourite.
Mina lobata: $W . P$. It is a half-hardy annual. It may be obtained of W. Thompron, Tavern Street, Ipswich.
"." The applications to name fowers, and supecially fruit are sonumerous at this season as severely to tax our resources. They readers have no idea. We are always willing to oblzge our correspondents as far as wecun, but the editing of the Gardeners' Chronicl: is our business, to which everything else must give woay. Correspondents are respsctfully requested to observe the rule that not more thas six specimens car be dealt with at a time. If more are sent, it woud be a qraeeful act on the part of the sender, to send also a small contribuion to the Gardeners'

Gardrners and others Wanting Situations. 26 words, including name and address, 18. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion
Position.-Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.
Postal Orders.-To Advertisers, Subscribers, and Others.-It is very important in remit ting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to A. G. Martiv, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.
N.B.-The best and safest means of Remitting is by POST-OFFICE MONEP ORDER.
Advertisements for the current week most reach the Office by first post, Thursday morning.

## all Advertisements should be addreamed to the POBLISHER

SATURDAY, OCTOBER 5, 1895.

THE ROYAL SCOTTISH ARBORI CULTURAL SOCIETY.
$\top^{\mathrm{HE}}$ members of this Society went to Germany this season for their annual outing-perhaps the most notable excursion they ever made; but never before has so little been said about it. Is this beoause it was an unlearning lesson the members had to read? When the report of the expedition appeared in the Scotsman at the time, I was wandering in the over-thimned woods on oertain highland estates, and I out the articles oat, expeoting, however, to see more about it in the arboricultural papers, but have been disappointed. I therefore beg to append a few admissions from the Scotsman article, written apparently by authority. Many times and quite lately, the superiority of the German forests has, by members of the Royal Scottish Arborioultural Society, been attributed to difference of soil or olimate, or to the species grown, or to all three put together; but it is now gratifying to find the Society acknowledging its errors on these points. I begin with the following extract:-
"There are many way: in which Great Britain agreet with Germany in regard to the growth of treen. The soil in both cases is very much of the same character-sands, loamv, clays, and marla constitating the predominant types. The climate, on the average of the year, agrees very closely in both coantries as regards rainfall and temperature, the greater cold of a German winter being counterbalanced by the warmer character of a German rummer. And the trees caltivated in, or indigenoas to, the two countries show practically no difference as regarde apecies, the Spruce, Scotch Fir, Larch, Silver Fir, Beech, Oak, Birch, Alder, Sycamore, Asb, Sce, constitating the materials that the German forester has to work with just as at home
"Here (Germany) the woods are formed neither for beauty nor for game cover, bat for the prodaction of the maximum yield of the fineat timber. There is here, therefore, no inducement to over-thin the woode so an to encourage the development of the lower branchef; on the other hand, the trear are pecked elone at they will grow, with the rewult that long, atraight, bare pole are produced, whick posese abont as much beauty as ilamp-pont, but which farnish timber of fine fibre and clown prowth, which carpenters and architect lnow how to appreciate."
I decline to believe that there are neither beanty nor game in the Germany forests, for both are there-nor is there any force in the argament that either beanty or game are enhanced by overthinning, nor has Brown or the Royal Soottish Arboricultural Society erer advocated sevore thinning on any such plea; but probably the writer felt some trifling apology necessary and just pat it that way. Here is a hit about
a timber crop left for fifty years " uninterfered with by the hand of man," a plan some of us have often reoommended as preferable, at any rate, to the Sootch thinning praotice:-
"Saturday, Auguat 3, waa devoted to an inapection of the Oak woods in the neighboarhood of Freienwalde, a short distance from Eberawalde, and in some respecte this was the most enjoyable part of the whole excuraion. It was the general remark of the excarsioniats that the work seemed to grow in intorest day by day; but this feeling was probably indaced by the fact that sa time went on the members were becoming more familiar with the conditions of German forestry, and therefore better able to appreciate the reanits. The forest around Freienwalde is for the most part primeval-that is to nay, up till within the last fifty years or so it had been left uninterfered with by the hand of man. But now it is being gradually taken in hand with the object of regeneration, and as the woil is very rich, the Oak is the tree that is denigned for the dominant apecies. The older clast of Oaks are 250 to 300 years old, and average 120 feet in height, and 3 feet 6 inches in diameter. They are for the most part perfectly atraight and with very little taper, and were univereally acknowledged by all to be not only finer than any trees that the members had ever ween before, but finer beyond any conception of what was ponaible. The total quantity of timber per acre averages about 6500 cabic feet."
In oonolusion, it is worth remarking how rapid the change of opinion has been latterly on the subject of forestry practice - thanks, not so much to recent books, bat to discussion in the horticultaral and agrioultural papers, which have suggested the books. Nor will the attempt to saddle past failures on the owners of estates and the game stand looking at, for however much these may be to blame, it is a fact that forestry practice, and the choioe of species to plant, have been almost wholly in the hands of the foresters, whose advioe landowners have followed. A gentleman who owns extensive woods in the Highlands oalled on the writer the other day, and, speaking of his own woods, said they were next to worthless as timber. The trees were neither of the right sort, nor their timber of the right quality; and all, he said, beoause "we had not known any better-what to plant, or how to manage woods."
A question of some interest I would like to put here. There have been advertised for sale lately nearly 140,000 onbic feet of blown-down mixed timber of fair average quality on the Duke of Argyll's estate at Inverary, and another sale of only less extent at Finavon, in Forfar-much of the timber "exoeptionally good," and it would be exceedingly interesting to know what price per foot the different kinds of timber in these lots fetoh, trimmed on the ground as they lie, if the owners or their agents have no objection to furnish the information for the benefit of their neighbours. $J_{0} \mathcal{S}^{\prime}, W$.

## New or Noteworthy Plants.

## PILEA SPRUCEANA, Wedd

This new Tintroduction of Mearr. Low \& Co. is now llowering in the Botanic Garden at Glaunevin. It in a dwart herbaceors plant, with a pubercent atem, leafy at the top. The leaves are opposite, on athort petioles, with a broad, rounded, membranous atipule in front of each; the blade of the leaf is elliptic obtuse, with cremate-dentate margina, strongly three-narved, and bullate batween the veins, thinly shining on the apper aurface bany-green, and very 2 inchee long, 10 lines to 1 parple beneath, 1 to Howers are in flat-topped torminal broed. The green colour.

Pilea Spruceana ought to make a useful decorative plant where dark foliage is desired, and posibly it might be found uneful for summer bedding. It in a native of Peru and Venezuela. N. E. Brown.

## Afplanium (Euasplenitu) Oroupouchense, Prestoe, M.S, n. sp.

Stipiten, alender, naked greyiah, channelled, 3-4 in. long; frcndm narrowly lanceolate, bipinnate, chartaceons, glabrous, glonay, but dall green, $\frac{3}{4}-1$ foot long, reduced at the base, tapering upwarde into gradually reduced segmenta at the acuminate apex ; rachir alender, grey, channelled, naked; pinno apart, the lower distant, alternate, except the reduced basal ones, apreading, nearly seasile, base caneate-truncate, broadest, the end rounded bat toothed, $1-\frac{1}{2}$ inch long, $\frac{4}{4}-\frac{1}{2}$ inch wide ; pinnule caneate, blantly dentate on the outer carred edge, about 3 linen long and wide; veine flabellate, slender, reaching short of the margin; sori short, medial on the veinlete, $\frac{1}{4}$ line long; involucres equally short, rather vaulted at maturity, revealing the crowded sporen.-Trinidad, West Indies.
I have had apecimens of this Fern for some long time, referred to me by Mr. Hart, who found it in the herbarium of the Botanical Dapartment, under the M.S. name given to it by Mr. Prestoe, apparently its first diecoverer, after the district or locality where it grows. Mr. Hart has lately gathered it in the asme region. I cannot find that it has ever been dencribed or pablished. It belonge to the cuneatam groap, bat is well marked by the narrow, slender frond and thort Dareoid sori and involucres. It makes an interesting pot-plant. G. S. Jenman, Demerara, July 24, 1895.

## Orchid Notes and Gleanings.

## ARUNDINA BAMBUSAFOLIA.

Tre elegant Bamboo-like growths of this pretty Orchid, which are often 4 or 5 feet in height, render it an ornamental plant even when not in bloom; but when furnished with its terminal heads of rose and purple flowers it in a charming object, and as the flowera follow each other in aucceanion, it laots in blonm when in good condition throughout the whole aummer and autumn. It is at present in flower in the collection of Gro. C. Raphael, Euq., Castle Hill, Englefield Green (gr., Mr. H. Adamı). The plant is evergreen, and therefore requires to be kept moist at all measons. It ceems to thrive best ia a cool part of the intermediate-house.

## Cattleya Dowiana aurea.

This charming yellow-coloured, fragrant apecies seems to have flowered exceptionally well this season if we may jadge by the specimens eent by eeveral correspondente. Accompanying some very fine and richly-coloared flowere, Mr. Geo. Roberts, gr. to R. Bruoman-White, Euq. Arddarroch, Garelochhead, sende snote, "Wo have had a splendid show of Cattleys aures this reason. Already over 100 blooms have opened, and there are atill many in bad. At you will eee, the lipe are very brond and of very dark parple-crimen coloar, the gold veining in them ranning in some almost to the margin."
Mr. A. H. Marrell, gr. to A. H. Milton, Esq, Castleton House, White Lzdies Road, Clifton, almo sends a grand flower, in which the petals are marbled with row colour as in C. aures marmorata.

## Masdevallia guttulata, Rchbofo

I can confirm De. Kräozlin's sapposition (p. 324) that Masdevallia Lawrencei is the plant which I described in 1890 (Gardeners' Chronicle, 1890, ii., p. 267) ac M. guttulata; and, what is more, I can atate that it is also the M. guttu'ats, Rc ab. f. (Linnoc, xli., p. 118), described in 1877. The latter was not unknown to me, but I had placed the reference next to M. ionocharie, Rchb. f., because the flowert were said to be of the same aize, and no other affinity was given. I had seen the plant two or three times unnamed before finding it under the name M. guttulata, which I adopted, thinking it to be only of garden
origin. Afterwards I found that it had then given by Reichenbach himaelf. I overlooken M. guttalata, Rehb. f., because I did not look in the M. ionocharis group, any more than in the Chimana or Coccinea group, to which I knew it did not belough The identity of the two has been duly recortan (Woolw. Monogr. Masd.), and it is most unfortanath thas $D_{i}$. Kiäozlin should now add another
ay nonym. $R$. A. Rolfe.

The Ashlands, Newchurch-in-Rosibsda,
Within a radius of 20 miles of Mancheater thea are, as is well known, many fine and nalmb collections of Orchids, whose treasures have bay repeatedly aeen at the Whitsuntide exhibition but in the Botanic Gardens, and at the mesting of the Rogal Horticaltaral Society in London. Thernen several collection which, owing to the moluty ${ }^{\circ}$ their owners, have hitherto seldom been adialud.
 these. There has bsen got together at thir plum a collection which at the present moment car mil hold its own amonget those which are more mider known, and may shortly rank as one of the finatio the district.

Unlike the connoisseura in the south, whow gardens are more favourably nituated, climatienly and atmospterically, the gentlemen of Mancheter have in many inatances built or acquired their midences almost within aight of the buge chimng atacks of their mills and manufactories, out of whim dense volumes of smoke and soot are being emittod day and night. It is therefore gratifying to haveto note such excellent examples of health, cleandina, and floriferounens as are here found.
In a house chiefly devoted to Dendrobinme then was a rich display of bloom, the more conpienoun plants being D. Phalænopais Schroderianum in many varieties; good plante of the beantifal $D$. Dearei and of D. formonum giganteam. In thit hoam a plaat of Catasstam Bangerothii of grand quality, and carrying a fine apike of ten very large fower fally open, with two other flower-spikes approching matarity, and one spike of twelve blossoms of equally large flowera juet passed, was remarked. Conider. ing the plant has but two lesde, and it is gromisg ia a 6 inch basket, it can really be said to bo 1 apecially floriferoas example. Of Cypripedinal there was a goodly show of flowera, whiltt the namber of unopened apiken visible amongt tho foliage told of a rich display coming on.
In the Cattleya-house there was quite arpo number of apecies in flower, fine plants of $C_{0}$ D swiana, C. D swiana aurea, C. Harrisonis violace C. bicolor, a very fine form, with bright tany yellow sepals and petale, and dark amethyst-coloured lip; C. gigas Ssnderiana, Athlands variety, which it naquestionably worthy of ite distinctive appellation, is a fiae and well-formed flower, measaring ove 8 inches acrone the petala, which are broad and fact The colour is a deep rose-pink, the petale hessily pplashed with bright violet-parple, reminding one of the beautifal C. Monsix Hardgana: the lip iu lare and 1 at, of a bright purplish-crimoon colour in the front, orange-yellow veins showing in the throlk Of Letias, two fine plants of L . elegans of the Schile leriana type were remarked in flower, oze having st inteneely deep purplish-crimuon lip; also namber od the Le'ia preatans and pamila sections in mang varietien ; Oacidiuma, Miltonisa, Epidendrume, and others, in flower.
Ia the Olontoglossum-house there was not much bloom, although there were some few good formo of O. crispam, and a particalarly good plant of one of the ficest forms of O . crispum gattatum.
The collection embraces most of the apecies and varieties uaually met with, whilat rare and conlify species and varieties are numerous. Great prailio is due to Mr. K. Pidgatey for the evidently intalligent manner in which he managea bis charget to

The last part of this pablication is devoted to the illastration and description of a beantifal serima variations from Cattloya labiata var. Mousim wim fewer than forty-aix forma are described, many will

Latin namen attached. Ai it is clear that accurato lines of demarcation and claasifeation cannot be drawn for these individual forms, is it not denirable to call them all-an some are already-by namen nuch al Quetelet, Crépin, Damortier, Morren, Spring, K ckx, van Beneden.

## DEUTZIA LEMOINEI

Dretzia Temoinei, which was brought forward for the first time at one of the meeting of the Suciéé Nationale d'Horticulture de France, on A pril 12, 1894 and whote appearance was signalise d by a favoursble dercription in the Bulletin of the anme Society,* it a hybrid from $D$. gracilis $\times \mathrm{D}$. parvi日ora.
troduction. It came originally from North China, and the vicinity of the Amour river, whence it wan introduced into the Imperial Botanic Garden at St. Peterabarg, then into the Arnold Arboretam at Cambridge, Liated Scatea. Profentor Sargent, the well-known director of that eatablimment, seat ut nome branches, one of which put forth a bad which developed and took root. Thas we were enabled to be the first in Earope to introdace thin fine species into the trade. At the amme time the Paris Nataral Hiatory Maseam had receired from Profensor Sargent in 188\%, some seeds of the asme apecies, and ancceeded io blooming the two or three plants thas raised. Thi plant forms an upright tult, acarcely more than 5 feet bigh, the stems rather thick, atiff, and atanding vertically, the leavet elliptical or
of 1891, D. parvifora prodaced a certain number of hybrid, waich, planted the second year in the open ground, bore unharmed the cold of the three late winters. They are talta about 3 feet high, the brancbet of which are quite erect, and bear from parly in May clasters of flowers; an many na from 100) to 1500 flowers and bads may be counted on each plant.

Ia general appearance 1). Isemoinei $\%$ is interme diate between its two parents, although it has not their qualities. The branche are more upright, firmer, and more solid than in D. gracilis (8), more regular in appearance, not no long, and in greater namber than in D. parviflora ( 9 ). The inforescences are developed in all the axile of the branches, appearing early and in a regular manner, oo that no lack or

Fig j0.-D.otzia hemonel
(Fhom a piotograph)
-
D. gracilis, Zaccarini, which grown in the damp mountain valleys of Japan, is a little bushy shrab with lancer late leaves, and white flowers arranged in single baches, with glabrous anthera borne on the central point of a trilobed thread. This apecies, introduced by Siebold about the middle of this century, and brought into trade by M. J. Baamann, - Ghent aurseryman, is now aniversally grown; it is raised in large quantities for forcing, and it is even atated, in the Nouveau Jardinier, that "this of all shrabs is the most suited for this kind of cultivation." It is bardy, and likee a light, freah soil, whersin is a good proportion of peat.
Deatzia parvifora, Bange, is a shrub of recent in-

[^35]lanceolate, dentate, much reticulated and wrinkled on both aides, deep green in colour. The preceding year's atems bear down theif entire leagth amall truses of flowers exactly resembling those of Hawthorn in appearance. The flowera are widely open, the petala are creamy-white, ronnded, and diminiahing at the base into a very narrow poiat, which displays the calyz at in many Ronaceone planta. The atament are clear yellow, the threade juat spreading at the base, but not muriculate at the summit.

This in the mont valuable species of the genus, as the flowers open in April, some day: before those of D. gracilin. Further, it can be forced; leatly, is is perfectly hardy in the climate of Nancy, where varieties of D. creanta are often frozen to the ground level.

Crossed with the pollen of D. gracili in the spring
spaca is viable; while in D. parvilora it in not rare to see long stems bare of Aowers here and there, and as if by chance, The hybrid hae not the corymb of D. parviflora, nor the long truet of D. gracilis. It beare a ramilied panicle, arect, wometimen homispherical, sometime cone-shaped with broed baep. Fich cluter includes from fitcen to ewenty-fice large and well-opened flowert, meanuring 3 of an inch to an inch, in appearance different to thoe of other Dcutzias. The petale are broad, oval, with undalated edgen, of the purest white, and quite concealing the lobes of the calyx; the stamens are reddishyellow with a trilobed thread. The flower of D. Lemoinei $\times$ are apread quite out, while those of D. gracilis have pointed petal, and are generally but a little open; they touch in the inflorecence eo as completely to hide the pedancles and pedicela; this is not wo with D. parvifora or D. gracilis.

Drutzia Lomoineix is an excellent shrub for forcing, as is testified by the plants given in April, 1894, to the Socié é d'Horticultare de France. They were takea up and potted the previous autamn, then grown in a cool honse. Piaced in the temperatehouse, they would flower much sooner. The plants that obtained are well formed, regular, laden with pare white flower, withnat being encumbered by too abundant foliage. Grown side by side with D. gracilis, they surpass that plant in bearty. Thas we believa that this new shrub will soon be widely moltiplied for forcing, and will gradually supplant 1). gracilis. Ia the open ground it needs no special care, so it may have place in all gardene, however smal!. (Juite as floriferous as is D. gracilis, it has the edvantage of being more hardy and sturdy, of growing mach more quickly, and of flouristing in any soil. Emile Lemoine, Nancy.

## VANILLAS OF COMMERCE

The August number of the Kew Bulletin contains an interesting historical and descriptive account of the species of Vanilla yielding aromatic fruits, more or leas uned in commerce, which has been prepared by Mr. R. A. Kolfe, A.L.S., Assistant in the Herbariam, who has also monographed the apecien of the gerup, filty in number, for the Linnean Society

At least five pecies are aid to yield aromatic fraits, snd three are knoचn to be used in commerce, though the well-known V. pianifolia is by far the most important, and practically the oniy curce of the commercial product. The history of this plant is very intereating, and it is remarkable how long a time elapred before the botanical source of the economic article was known. It appeare that it was uned by the Aztecs of Mexico an an ingredient of chocolate prior to the diecovery of America by the Spaniards, who adopted its une, and that it was brought to Earope as a perfume about the year 1510 , at the asme time as Indigo, Cochineal, and Cacao, and ten years before the arrival of Tobacco. Clusius put the first botanical notice on record, in 1605. He bad received some fragrant pods from one Morgan, aposhecary to Queen Elizzbeth, and deacribed them under the name of Lobas aromaticus oblongas, without being amare of their origin or use. Nearly haif a century aftermard Hernandez gave a figure of a fruiting branch under the name of "Araco aromatice." The native name was given as Tlilxochitl, bat ite uze aa a drag only ia mentioned. The original figare was one of a teries of 1200 executed in Mexics daring the previocs century by the King of Spain. In 1658 Piso stated that the fragrant ailiqua or pod was called by the Spaniard Vagnilla, and that it Was uaed both as a drag and as an ingredient in the manafacture of chocolate. The name is the diminative of the Spaniah Vaina, a pod or capsale. fowards the close of the century Ddmpier gave some interesting information about the plant. In a amall Indian village in Soath Mexico he foand a large quantity of Vanilloe drying in the sun. The fruit was dencribed an a little "cod," growing on a amall Vine, and turning yellow when ripe, when the ladians gathered and prepared it, and aold it cheap to the Spaniards.
The Vanilla wa introduced to Englend before 1739, in which year the firat edition of Miller's Gardeners' Dictionary appeared. In this work he states that having received some branchas of the plant, which had been gatheredat Campechy by Mr. Rubert Millar, and sent bome by way of sample, he planted them in small pots and placged them in a hotbed of tanner's bark, where they soon put out leaves and roots. Nothing further is recorded about them, and is is probable that they were soon afterwarda lout.

By this time other apecies of Vanilla had become confued with the true plant, and one of there was ultimately described ander the name of V, aromatica,
though the name wau evidently though the name way evidently taken from the cconomic plant. For many years V. aromatica was but at longth it wource of the Vand that its of commerce, aromatic at all.
V. planifoliu was described and figared by Andrews, ia 1808 , from a specimen which flowered in the cullection of the Right Hon. C. Greville, at Paddington, which had been introduced by the Marquia of Blandford, but it was not until long afterwards that it becime known thai this species was the source of the Vanilla of commerce. A year before the selfsame plant had been figared and described by Saliabury under the name of Myobroma fragrans. Hamboldt, in 1811, and Schiede some years later gave a considerable amonnt of information respecting the Vanillas of Mexico, and the latter described four new apecieg, two of which, V. sylvestris and V. ativa, havesince proved to be the wild and cultivated forms of V. planifolia, ard a third, V. inodore, to be the one so long known as V. aromatica. Prof. C. Morren first ancceeded in producing fruits in quantity and in proving that V. planifolia was the source of the commercial prodact. By a certain method of culture he succeeded in obtaining fifty-four flowers on one plant, and by fertilising them artificially, obtained the ame numb $r$ of pods. A year later he succeeded in obtaining a crop of 100 pods. His paper "On the Production of Vanilla in Earope," which was read before the British Association st Newcastle in 1838 , was remarkable in several respects. Besides proving the batanical source of the Vanilla of commercs, and showing the need for artificial fertilisation, he a'so succeeded in tracing his plant to the original one in the Right Hon. C. Grevilles collecLion at Paddingtov. It appear that Parmentier succeeded in obtaining cattines of this plant, which he conided to the cire of D. Summé, Diractor of the Antwerp B tanic Garden, where it grew rapidiy, and slips were widely distributed in $B$ flgiam and France, though thay virs eldom flowered, and never fraited. Ia $1819 \mathrm{D}:$ S mané sent two plante to the Datch colonies of Java, by M. Marchal, who, with difficalty, got one there alive. Tais flowered at Baitenz rg, but failed to frait; and in 1825, Blamel who can hardly have known it history, again dencribed it as $V$. viridiflora.

A very interesting circumstance about the Paddington plant did not come ont until many years afterwarde, ad that ip, that in 1807, the very year in which stisbury's fi sure appoared, a drawiog was prepared by Francis Baer, ahowing bo in the fower and alev the fresh frait. How the flower became fertilised is not known, nor set whether any aromatic fragrance way obserped. Morren thought: that the fruit might have been a commercial pod, but the drawing proves chat it was freab, besider ahowing the stalk by which it was attached. Deltiel atcribes the present importent indantry in Rexnion to plants obtsined from Paris in 1822, which it is pretty certain aluo came from the Paddington plant. He aluo atate that they pioved aterile natil about the year 1841 or 1842, when a slava named Elward Albins discovered a simple and rapid meihod of fertilising the fowers artificially, which has been practised ejer aince! He also states that artificial fertilisation was first practiaed by Namann in the Jardin des Pantes, though no mention is made of this by Morren. In Mexico and Central Acmerica fertilisation is effected naturally by mall bees beloaging to the genus Melipone, which visit the dowers for the alce of the honey they afford. Etuewhere artificial fortilisation has to be renorted to.
With respect to the other apecies with economic fruite, it appeara that V. propona, Schiede, has thicker, very fleshy pods, which are more dith sult to dry, asd also fetch a lower price on the mirket. They have, however, long been known as an article of commerce, and are largely aned in a fresh state. It is diffased from Mixico to Gaiana and Colombia, and is cultivated in the Weat Indies, being the sourcs of Weat Iadian Vanilloen. Biazilian Vanilla is produced by Vanilla Girdieri, Rolfe, a apecies here described for the first time, having previously been confused with V. planifolis. "Soath American Vanilla," it is thought bolonge to the samo species, anil of this as much a, $9,000 \mathrm{lb}$. are aid to have been produced in 1891. It has a rank odour, and is probably uned an an adalterant. V. odorata, Prest, nad a ow specier called V. appendicalata, Rule,
have aromatic fruits, but are not known in commem, An indigenous West Indian specien, called V. pha. antha, Rehb. fo, has also been caltivated as a Vanilla plant, but has little perfurae. According to Hamboldt, there is a Peruvian apecies with aromutie fruits, but notbing further is known about it. Thu it will appear that the author has brought out nerent interesting and unexpected factis. Trose who would read the matter in full should refer to the origina

Foreign Gorrespondenoe,
POISONING FROM EATING GRAPRS,
Alfhough not bearing directly on the abjemer poisoning by nicotine, appearing on p. 334 of the Gardeners' Chronicle, the following remarta ann ficient to prove the langer of using ijprion remedies upon products which are caltinted for market purposes. In France, in almont erery nine yard, suiphate of copper is used either as a cmeor preventative against mildew, which atteck the leaver, and in springing the leave the berien naturally receive a certain amount, and which rhen eaten produce a slight poisoning. Here (Cannee) at this edsoa of the year, when Geapes are cheep and plentifu!, I have remarked an increased ocarence of illoess, which medical men attribate of colic, bat waich I coatend is really slight poisoning frour eatiog G:apes which have alphate of copperoe them. I have mut with several cases amongt friend, and have aleo found the effects of it myself; and as further prozf, I find the paia is accelerased by driaking anything contaiaing an acid. Considering the greater part is used for making wine, where the poison would be nullified by fermentation, the danger is not great; bat in any way, I monld asame that the addition of copper (placed in the wine), which is often practised, would bo unacemmr. Riviera.

## The Properties of the Grape vine。

 If our forefather $\mathbf{A} d a m$ was of a philanthropic turn of mind, and knew the many properties of tho Vine, he muat have felt a plessare in handing dont to mankiad a plant which would prove in itself a ministare pharmacopceia. Perfectly ripe Grapeas good for person saffering from iaflammation, and as gascritis, \& ? whilat the anfermented jaicz (wort) as a popalar remady against dywatery and bloodVimmiting. The asis from the canes acs as a diarebie. Tha leapan, dried in the hade and powderal, an asel in casen of benorchage. The sap from the ynans shoos is used for iatammation of the ajoth Died Ruisina ara an excellent pectoral for affoction of the chest. White wine ac is as a tonic aperitirs; Whilst red wine (which poets love to quate) if both nourishing and fortifying, if taken in moderation. Agaia we have the vinegar, which is emplojed for wo many purposes, and the oil, which is extracted from the seeds, and is used in southern Earope for illuminatiog parposes. Riviera.

## Oxalis tropejoloings.

I am andiag you by asmple-post a plant of Oadin troparoloides, Aarora, and one of O. t. Brillianf and I wish to tell you that seed of these yields from 30 to 70 per cent. of variegated plants ; Aaron gruilh nases with jellow seed-leaves, but Brilliant an White seed-leave (I refor to the firat leaves nifuing from the seed), bus later leaves display the dime colourt variegations. Aurore does not change to the curn lize of Brilliant, nor do the leaves of Brilliant tary slor those of Aurora. Both specie are of so growth at first, and later on not growing so quadide as does the old variety. The intenaity of colh allee is so vivid and attractive that both are worn ahat in the garden. I would further mention variety was awarded a Silver Medal at the reatio
 Saptember 8 ). I have been told that tria ader bis have nam d Bitliaut was shnwn in 18 , name of Oxalis tropadoides rosec.piner, burg. TTia spacimens which accompanied this were exceedir ly pretty and high coloared. Fa

# The Herbaceous Border. 

## aster madckil.

Amongrt the moat diatinguished-looking and ductioce Micbaelmas Daisies now in flower, Aster Marckii (Ragal), a native of Japan, dezerves favour able notice. Toe height is abous 4 feet, the habit good, and the flower as large as that of A. nove anglix, the rays are regalar and horizontal, of a pale purplith-blue. It came to me two years ago as a novelty from Mr. W. Thompaoa, of Ipawich, and spread very moderately. I observe in Mr. Thompson's noed catalogue Amur-land given as the habitat. C. Wollay Dod, Edge Hall, Sept. 29.

## The Herbaceous Phloxbs.

The Phlox baing my favourite plant, and having grown it for gears with some degrea of nuccess, I was intereated by Mr . Douglan' remarks at p .325 concerning them. I am notsare that Mro Douglas is writing of the shrubby Phloxes, viz., P. suffraticosa, or the garden form (Y. omnifora), at all, aince the greater portion of his notes bears no reference to this section, but are directed to the horbaceona Poloxes proper, viz., P. decnasata. The two sections are too distinct to be mized by anyone, even if they desire it. Thone who require Phlozes that are motily dwarf in habit, will find them in P. suffraticosa varieties which, in reality, are the allrubby Paloxes proper. Taese range from 1 to 2 feet high, and a few kinds c:ller than this, bat they have not the wide range of a,lour that we fiod in the herbaceous Phloxes, viz., the varietifs P. decusata. The shrubby Phloxes are, moreover, wach the more delicate; aluge are their pernicious enemies, devouring the poung shoots almust as fast as they appear, uniess prevented doing $B 0$, and in few gardens do they thrive sufficiently to Le of much decorative value. Bat it is quite otherwise with the herbaceoas Phlozes, the growing in almost any garden. The fiue variety Etna (Lemoine) mentioned by Mr. Douglas, hat nothing to do with the "shrubby"section whatever. This kiad undonbtedly belonga to the herbaceons group. The other varieties mentioned I am not acquainted with, Mr. Donglas aays that the Paloxes of twentyfive years ago were too tall, and this wat true enough of nome kinds, bat there were good dwarf kind also, which are scarcely superaeded to-day. For example, take coccinea, Regulue, J. K. Lord, Lothair, Madame Moisset, Independence, The Queen, and you have an assortment of the dwarf kinds twenty-five years since that figure among the best of to-day. But I believe that height of stem is simply due to culture, an I find nambers of the old varieties which I have grown, fully 4 feet high, and completely foliaged to the ground at that height, figuring in catalogues at the present time at $1 \frac{1}{2}$ foot. These herbaceous Phloxes, when well grown, are among the grandeat ornaments of the garden, and those that require to be "masked by other planta" are certainly not well grown by any means. Phloxes which in dry seasons are devoid of leaves on their atems to a great extent, have affered distinct neglest. Sach plants mast either be very old, or be standing in the dry soil of a crowded ahrubbery, or have been afforded insufficient quantities of water, any one of which is quite sufficient to render them nnaightly. I do not know of any London narseryman who did greater jastice to these Phloxes than the late Mr. K. Parker, of Tooting, for not only had he a very fine and remarkable collection, bat he grem them well. This comprehenaive collection was the admiration of all, and the great massive heads of colour thrown up for weeks together was a sight in itself. The whole secret of his auccess was in affording moisture at the root. The large specimen beds were planted near to the water-tanks, and in summer-time, twice, and sometimen thrice weekly, the bed wore flooded; and so that the water mould not ran away, a ridge of earth was formed round the beds to keep it in. It is apparently a forgotten fact that these Phloxes, or at least the original species, is almost, if not quite, a bog or march plant. At any rate, there is no
position in the garden that in ammer time will anit them so well. I must also confes bhas I have little faith in the reputed dwarfaess of the new kinds. Given the requiaite treatment for full development, there is acarcely any variety of this section knuwn to me which will not, in the econd jear after plantiog, attain to a heigbt of from 3 to 4 feet. These Paloxes, slthough they flower well the birs?, do nut atuin perfection till the second year, and this only when let alone. Mr. Douglas aggeate replatuing, if it is intended to carry them on a second year. This is one of the greatest posaible errors in Phlux culture, and is aimply and aurely the undoing of the first year' work. Such a nyitem not only keeps the plante unnaturally dwarf, bat it aloo, and that must effectually, restrict the development of the fowerheade; and it ia no doubt in a largedegree due to this or similar treutment that we see these lnnloxps so poorly grown ginerably, for it musio sosurtuly follow that any cuitural treatment rubbing the plant of ita nataral development will rot ioupuve the colour or the siza of the Hoxere. The preas mrjerity of these herbaceous Phloxe will produce immense panicles of bloom 1 to $1 \frac{1}{8}$ foot through when well grown, irreapective of lateral ; but to getanchreaules the plants must be put out in their permanent places, when, it intelijgently treated, they will bloom well. The cutting inserted in the spring of 1895 will procuce one fluwer-head about Auguat the ame year; und, if let a!one, it will, in 1896 , prodace from four to six fine heade of bloom; and, if still left undiaturbed, and roaked with moisture in the ammer, will, in 1897, produce from twenty to twenty-four much finer head of bloom than ever. I note that Mr. Douglas would reatrict the heads of bloom to three on esch plant, but I canvot usderatand the reason why. To obtain the kest realta, the soil must be deeply trenched and heavily manured; in these matiers it is imparsible to err. Eoploy young plants, from cattioge if posible; failing these, the fresh joung growths from the outside of large clampe, carefully avoiding the hard woody material. If pot plants are obtained, ahake them free of all eoil, and, removing any small muckers, reduce to one atrong shoot, and in planting spread the root horizontally. The old stem nould be buried at leat 2 incher, as the plant are great surface-rooters. Phloxes may be planted over a rather long eason; but, for ensuring sucsess, the early autuma is in every way excellent. In mamertime aupply them abandantly with water, and liquidmanure in plenty; and while a heavy malch of manure will be most helpful, moisture must always be regarded as being very essential to succensfal caltivation, E, Jenkin, Hampton Hill.

## THE WIZARD OF HORTICULture.

The name and fame of Lather Barbank are worldwide. He was born in Lancaster, Worcester County, Mase, on March T, 1R49. From hia continud euccesses in producing new forms of living plauts in nnexpectud directions, ho is often called "The Edison of plant life" and "The wizard of horticulture.
At eighteen years of age, after baving received a liberal education, Mr. Burbank went to Worceater, Mass, to learn wood-turniog and pattern-making. After three years, and inding the dast and confinement not suited to his tasten, he parchased a 20 -acre farm in Lunenburg, Mass,, where he could continue to study, inveatigate, and experiment with the variations of plants, and this was where the "Barbank" Potato originated, and where many other experiments were instituted, rome of which have since resalted in valuable fruitn, flowern, and vegetables.
Finding the climate of Now Eagland too severe for some of the plants with which he was working, he removed to Santa Rona, California, where he hat since lived, and whese his creative work in pronuce dived, fruits, flowers, vegetables, trees, shrubs, and grassee bas made his name famons; the benefite conferred by this work will be better known a gene-
ration bence, for it is a pioneer work, and the life of one man in too ehort to ahow the full resalts.

The work which Mr. Burbenk is now doing would aeem to be enoagh to occapy the time and abilities of a dozen men, and, not being matistied with the hardiness or hdbits of the material which can be produced througt the chanaels of the general trade, he takes juuineys of many thousad miles to the muncaina in the far North, where plant life has to atruggle with a brief sammer and a temperature of $60^{\circ}$ to $80^{\circ}$ below zero [?]. Derert and mountain top, swamp and field, each have to contribute to his omaivorous p'ant workshop, and when the finished prodact is tarnel out in the form of a grand new hardy crose-bred Piam, a frot-resiating berry, or a charming new Rosa or Lily, he finda ready asle for it at prices which seem fabalous to those who do not know the cost of time, thought, and labour necessary for its

From the muitisude of needlings raised each jear, he aelects a very few which, by their growth, show improvement over others of their apecies heretofore cuitivated. These are tested for everal yeara before their characteriatics can be definitely accertained. The aeeds of these icoproved apecimens are planted, and, a promising variation of the last generation of seediling having been produced, several improvements may be expected in the next generatios. The best of these are, in their tarn, selected for producing atill otherr, and, after a time, by this carefal selection, greas improvement is the natural resalt. Another means emploged is to select the bent varietien, and cross them with other. By this plan valuable varieties are sometimes obtained. The National Nurseryman.

## BELGIUM

## orchids at tile belgian exhibitions.

 itions were held in Belgium, one at Brassela, the other at Mortsel, Antwerp. At both, Orchide were well represented. At the Brusels exhibition, organised by the Socíé́, de Flore et la Linnérnne, M. Lacien Linden showed thirty Catasetums in bloom, all fine varieties which bad flowered last year; C. imperiale was even betcer than it was last season.- Many new varietie were added to those with which we are already familiar. M. Cb. Vaylateka ataged an admirable groap of fide varieties of Miltouis vexillaris var. sutumnalis; this is quite other than the common type; it alway flowers in Saptember and October, thas deserving the name of autumalit.M. Jules Hye-Leyaon ahowed a pretty miscellaneous collection of Orchids, among which may be named Vanda Lowi, Saccolabiam Blumei, Cypripediam Charlesworthianum, with two beautiful flowera, well-coloured, especially over the very wide atandards; OJontoglonam Harryanam; Cypripediam Morganise $\times$, remarkably fine; C.Blunti Labbersiana, with five plendid flowers; Cypripediam macropterum, with two flower-stems and six good flowers; C. Annie Measurea; C. Charlen Canham, with seven splendid blooms: Oncidiam Linceanam, marvellone ir colouring; Epidendrum aceftram, and Miltoniopais Bleuana.

Among M. Poeters' collection may be mentioned Vanda coralea, Miltonia vexillaria auparba, Oadidium Lanceanum, Miltonia Blanti Lubberviaka, Cattleya granuloas, Odontoglonaum Wilckeanum, Cypripedinm Morganise $\times$, and Cathleya O'Brieniana. MM. Stepman \& Mosn showed a fine collection of Cypripediams, including C. virens, sleadid es to colour; C. Charleworthi, and C. Sallieri Hyenum. M. Vuylsteke staged C. Ruthschildianam, with three flower-items and nile superb flowers; the plant strong and fine.

At Mortel, Antwerp, M. Flor l'awels ataged a remarkable collection of miscellaneous Orchids; among them may bs noted-Epidendram raniferum; Oncidium aurosam, with three fine bunchen of bloom; Aüride virens, with two aperb trasen; Cypripediam Bolerlaerianam $\times$ (C. Duthieri $\times$ C.

Harriaianam), flowering for the first time, the blossom large and good, with a flie standard, resembling greatly that of C. Harrisianum ; Vanda taavia, V. teres ; Miltonia Moreliana, with a handred flowers; Oncidiam incurvam, with seven fine flowerstems; Cattleya maxima floribunda, new, but not unfficiently fixed to be criticised; Dandrobium cruentum, Cypripediam Chamberlainianum, C. Thomsoni, Zygopetalum Ganthieri, magnificent in colour Acineta apaperba, with three fine cluatera of deli-cately-scented flowers; Cypripedium Veitchi, with four beantifal blosom: and Oacidium dasytyle, well-bloomed. MM. Jansiens \& Vincent sent 3 beantiful eelection, inclading the following:Oncidiam Lanceanum, admirable in coloaring; Odon toglosam Coradinei, a very pretty variety; Saccolabiam Blamei, Cypripedinm ceannthum auperbum magnificam, Catcleya crispa, Cqpripedium Athburtons, remarkable; numerous fine varietien of Odontoglosenm criepum, one of which, varo Triandi, was quite remarkable.

Commander Jonen also ataged some fine Orchida among them Odontoglossum Krameri, Trichopilia coccinen, O cariniferam, Pencatorea cerina, a apecien of Lycaate with olive-green sepalv, dotted and apeckled with brown, the petals and lip white, with numerous dall rose spots.
M. Jean de Bouschère exhibited an album of dried Orchid bloom, accompanied with illuatrations.

## Obchids at L'Hobticultobe Intebnationale.

We noticed that Catasetums were flowering even better here this year than last reason. We have before greatly admired many aurprisingly fine varie. ties of C. Bangerothi, splendens, macrocarpum, and othern, and woald farther mention C. Bangerothi giganteam, C. aplendens aureo-maculatum, of which there are numerous varieties ; C. aplendens aureum C. macrocarpam albo-punctatum, C. splendens maculatam, C. splendens album, C. revolatum roseopunctatum, C. O'Brienianum, and others. It is anamed that Cataeetams have but a short life, but, at this eatablishment, there is a plant of C. Bangerothi Pottoianam, which has been under caltivation for eleven yeara. In addition to Catasetuma, Cattleyas Rox and gigas are here blooming abundantly.
Many Orchid-lovers are aurprised at the great number of seedling Orchid here found, and which are the resalt of various crossings between divers genera and apeciey. Thap, at l'Horticalture Internationale, there are about 1000 Odontoglonams, all thriving young plante. Notable also are the very numerous apecimens of Davallia Truffatiana, a new plant, which will moon prove to posess valaable decorative qualities.

## Orchids at Deuene, near Antwrbp.

M. Flor Pauwela hat here no remarkable an eatablishment (amatear) that all plant-lovers panoing through Belgium should see it. Oa Augast 25, though reany fiowers had been cut the evening before, we found atill 109 flowering plants. We do not know when wo have before seen such succeasful caltivation of Pbaluenopsis, and on so large a scale ; the vegetation laxurions, the leave: frm, glistening, in excellent health; with promine of abundant bloom, which shall be spoken of later. Meanwhils, we commend this collection to the attention of Orchid-lovers. Ch. De B.

POTATO CROP AT BUXTED
At one time, owing to the long-continued absence of rain, it seemed doubtfal if Potatos this season would be worth lifting, but where the ground was properiy tilled and the aete proporly prepared, the resalt has oxceeded my expectations. I have lifted the enrly and aecond early linds, and find them atapartactory in everating rad respect. In a fow inatancen extent. The Avhlouf in, although not to a marious heary crop as anaml, nor were thore not such a bat the flavour is excellent, aud there is no large.
disease or of a aecond growth. The ame may be said of the second early kindm. From 200 aquare yards of ground more than 13 cwt . of good tabers of Sapreme (Satton's) were lifted, not reckoning the mall oner, and not one was diseased. Renown (Webb's), produced aboat the asme weight of tabera; Marvel was all that could be denired, even in nize, of good shape, and free from disease; Wrangler and A1 (Satton's) were very good, as were Perfection and Triumph, which prodaced good crops of even-sized, well-formed taberis free from disease. Considering that so little rain fell during May and Jane, it is matter for astonishment how well Potaton have tarned out. Only finch of rain was registered between the month of April and Jaly. The late atrong-growing varietien are not yet lifted. The haulm is making a second growth, which is a sure indication of renewed rootaction, and as thenoil in now very moist, nothing bat cold weather will atop growth. Where the akin has not "set," this may not be merious. I naually plant thase varieties at 3 feet apart, which allows of sufficient noil being drawn ap to make wide ridges, and this measure prevents the soil about the roots getting dry daring a meason like that of this year, and growth goes steadily on, even in a dry time. Two yeara ago no rain fell between planting-time and the date of lifting the earlien; atill, these were a good crop. Where the soil is poor the crop is very light, there not being safficient haulm to cover the ridger, and the sun-heat penetrated far into the soil, On my atiff land, unlens it be well prepared, there ir no hope of getting a satisfactory crop of tubert, it becoming baked into hard clods difficult to break into pieces. Where Potatos were planted on such groand, they have done very badly this reason, eapecially the ahort-topped varietien, I have given up planting divided metr, except in the cane of new varietien, of which there are few wets, the resalts obtained being much better from whole medium-sized onet, prepared by being atood on ond, eyes uppermost, in a light airy place. If the tubers are hardened by being exposed to the action of the aun for a few days, by being left on the ground after lifting, they do not atart into growth to early in the apring, and the shoots are more robast, particalarly if the rete are kept in a cool place till planted. Oa the heavy soils hereabouts, shallow planting is practised, but plenty of earth is drawn to the plants to prevent the tabers from pushing through the covering. The soil is made an fine as possible before planting and earthiug-up, and this, in a meanare, prevente it from getting very dry during droughty ammerr. I have dispensed with farm yard manure for Potatos, and I nue artificial manure inatend, which is sowed along the drills before the nets are laid in. The mointure in the soil diesolves it, so that the plant. are benefited at an early atage. Earthing-up is done at soon as the plants are anfficiently forward, and in this way the roots are kept moist, and should the meason prove a wet one, the moisture draina away into the farrows. H. C. Prinsep.

## KEW NOTES.

Tricons madicass.-In the warmer parts of thit country Tecoma radicans thrives well, even without the protection of a wall ; there is at Kew now an old apecimen flowering freely, which in growing in the open with no other protection then that which the abrube growing near it afford. Where apace can be given, however, a position on a wall facing south is to be preferred for the plant. It is a native of the Soathern United Stater, and according to Loudon, has been caltivated in England for more than 250 years. The flowers are borne in terminal claters on the long rambling growthe of the carrent season, About a dozen flowers occup in a clater, and each one is 3 inches long by 2 inches wide at the mouth of the trumpet-nhaped corolla, which is of a brilliant red and orange; the bave is clanped by the red calyx. When grown as a bath it ahould be pruned hard back before growth commences, and it will in time form a thick velf-supporting atem. On a wall
it can be extended at will, bat when oree than allotted apace is filled, the same hard praniag in necensary. It is ensentially a sun-loving plant of in proved by the great wealth of bloom after nummen like those of the present year and of 1893 。

## Ceanothos Gloibe de Vrbsatureg,

Whilat many of the apecies of Ceanothas are rem beatifal when grown as wall planta, or far nome to the south to dirpense with any protection af all, it is only comparatively few that can be inderim among really hardy ahrabs in the neighbourhood a London. C. azureas is one of the bent of then, m , of the numerous varieties of it that have benm out in recent years, Gloire de Verailles in-ling caltivation in the London district-probably then hardient and most useful. It is more vigorou is habit than the apecien itnelf, and the pariden flowers are much larger, and of a richer tint dilit At Kew, this variety is planted by itself in inem bed; the plante are 3 to 4 feet high, and forturlum two monthe they have flowered most profund, the feathery panicles of amall blae flowern airing 1 charming effect. The frotis experienced bus January and February were a anfficiently nemm of the hardiness of any thrab, and it apeak well for this Ceanothas that with no more protection thans thick layer of dry leaves afforded, the plantor reaind no real injary. The later, softer growth of lat yous was, as might be expected, killed, but thit ody anticipated the knife by a few week, all the varieties of Cennothas azareus atrike redily from cuttings.

## Eccremocabpos scaber.

Like other hardy and tender Chilian plana, this one han become quite rare. It was first collected by Archibald Menzies about 100 years ago, bot wa wit introduced to caltivation until 1824. It is a platas of a climbing habit, nomewhat Clematia-like folinge but belonging to the Bignonia family. It is andlly killed to the ground in winters of ordinary erverity bat occasionally it survives if the plant has the protection of a sonth wall. In any case the roota hoold be protected by a thick layer of dry tree-levee a brushwood. There need never, however, be avy fur of loning it, for it ripens weed in abundance; md seedlinge obtained early in the year and grown on in a frame nutil May, and then planted out, forre freely the following August. The flowera are bonto to the number of twelve or more together on the racemea, the corolla being tubular, $1 \frac{1}{2}$ inches looge conatricted at the month, and of a bright orange-wd The leaves are bipinnate, with dark-green, irreg. larly-lobed leaflets. The leaves are opposite, bit after flowering has begun, at every third or fourth node a raceme takes the place of a leaf. The mido rib is terminated by a many-branched tendril, by which the stems are secarely held to whaturet aupport is near. This was one of the climben apecially atadied by Charlen Darwiu when invali gating the movements of climbing plants. W. J. B.

## MORELLO CHERRY CULTURE.

Mr. Teuptre's intereeting remarks on the show mentioned eabject in a recent number of the Gardewn Chronicle (p. 293), recall to $m y$ mind the ine apeciwerid trees of the Morello Cherry which uned to sdorta probably adorn atill, the 18 -feet high wall at back of the carvilinear-roofed orchard-house at Scome Palace Gardens, Perth. The trees covering thind wall were fine examplen of good cultivation carefal training, being faraished from bottom to tor with healthy shoots, every one of which whe trinile with the atmont precision as regarded interveldif: apace and the point on the wall at which the in wre dual growthe radiated from the centre of eneh we. The young men who were annually entrutad mily the re-arranging and nailing of auch large troen sensible of the implied confidence and honour chas ferred apon them by the chief, and alao of the chbous and akill which the manipulation of the importace of small shoote involved, and of the impoarielion of the verdict which followed the cump It of the mork My friende Mesurf. D. T. Til
and George Smith, Vice-Regal Lodge, Dablin, and olber reader of the Gardeners' Chromiclo who have pither belped in the building up of, or have seen the Morello Cherry treet at Scone, will remember them with feelinga of pride, notwithatanding the recollection of benambed fingers and the intense cold sometimes experienced in doing the work.

I Lave no doubt about the trees of which I write, or the one which may have sacceeded them, being an fine examples of cultural kill now at they were then.

When I took charge of the gardens here a little over twenty-four years ago (Auguat, 1871), I made up my mind to have trees of the Morello Cherry to come as near those dencribed above an the dif-
about 3 fet deep, extending if feet on either side the place marked on the wall for the centre of each tree, and 3 feet therefrom, placing 9 inches deep of clinkers or brickbats, broken fine on the top, in the bottom of each hole for drainage, covering this with tarves, grasn-side down, and then placing therein safticient good yellow

19 inches in Chrcumprenoe, 4 Lb , in weight.
Awarded a First-class Certificate by the Royal Horticultural Society on September 5 lat. Fruits were exhibited at the Cryatal Palsce Sbow, which were himbly commandets (8ue 1.402.)

Perbapa my friend, Mr. McKinnon, whosucceeded Mr. John Halliday (since deceased), many years ago ia the management of Sccne Palace gardent, will kindly furnish particulars to the editor of thie Journal as to the present condition of the trees referred to above; alno a few note as to the oil, drainage, and treatment bestowed upon the tree in question, as
ference in height of walls (9 feet), woald permit. Accordingly, I planted several young trees at the fall of the leaf that autamn, and with what euccers I shall leave to others who have seen the trees from time to time in fall bearing to asy. Having obtained bealthy young trees-the irat consideration in naccessfal frait caltare-I opened holes
loam (to which a little lime-rabble had heen added) to plant the trees in. I may here remark that prior to plating the tree permanently in the hole thas prepared for them, they had been grown on in available pace between Peach and other tree for a year or two, according to space, in which to develop their growth. Toward the end of September these
treps had a treach taken out around them, and a little of the moil removed from under the roots, wo as to admit their being lifted and transplanted with nice balls of earth adhering to the roote, thereby preventing the trees experiencing macb, if any, check in the proces of transplantation, cutting off any damaged roote, and shortening back straggling ones before placing the individual trees in position, afterwards working the soil well among and abont the roots, and finally treading it over before laying on a surface-dresaing of ehort dung to the thickness of 3 or 4 inches, and extending cuer the loosened ground, and giving afficient water to sittle the sail about the roots, the trees being then secured loosely to the wall to allow of the soil settling down a littia before being finally nailed. The trees are treated in preciely the ame manner an Peach and Nectarine trees, as regards the laying-in of the young shoot annually, cutting out old ones, and the spurring back foreright shoots.

Young healthy trees planted as described above, and afterward kept clean and afficiently moist at the roots during the aummer and early autumn months, cannot well fail to make natisfactory growth and yield remunerative crops. Oar tree have never failed in yielding beavy crops of fine fiuit, which from the middle of September up to the time the crop is exhausted, are used for dessert, the flavour baving a pleasant sub-acidity about it.

The black-fly is the most troublecome pest to deal with that affect the young growth of Cherry trees; until this year the most effectual remedy that I bad recourue to wan tobacco-juice and clean water, used in the proportion of 1 quart of the former to 4 gallons of the latter. But this meason, heving been induced to give Bentley's "Compound Quasia Extract" a trial, I have no hesitation in pronouncing it the best and cheapest insecticide that I am acquainted with, 1 gallon of the Extract making nearly 100 gallon ready for nie. Another advantage which the Extract has over the tobacco mixture referred to above, in that it leaves no nasty mell aboat the trees on which it is ased; but being intersely bitter in flavour, it not only dislodges or destroy the aphis on the tree when it is applied, but it render the foliage lean liable to future attack. H. W. Ward Lonaford Castle Gardens.

## FRUIT, VEGETABLE, \& FLOWER CULTIVATION IN GERMANY.

Fruit cultivation in the neighbourhood of Frankfort neem to have been recently taken ap with mach energy, and is fostered a good deal by nocieties which discuss the progress, and assist their members, practically and theoretically, in the selection of the qualities and treatment of cultivation. The Koyal College for froit, vine, and floriculture at Geisenheim on the Rbine, is especially referred to in a recent report at exerciaing a very beneficial influence in thit direction. It organises lectures for the instruction of proner pernons, who are trained as fruit or Vine-growere or florists; it also wende round travelling teachers to give lecturep, advice and inatruction, as to the most lucrative way of diaponing of the fruit crops, as to the best method of drying and preserving kernel or stone-fruits and vegetables, the packing of the frait, the preparation of froit syrup, jollien, marmaladep, \&c., and thus as to tha preserving of the fruit. The caltare of berry-fruits has been especially promoted by the introduction of wine made from different berries and other productions, which have been brought before the consumera by the numerone exhititions, where, by mean of prizes, endeavours were made to increase the zesl of the growers to produce fruit suitable for the market. Of late, special attention has been directed to the better disposal of the fruit cropa, since the caltivation iteelf has made auch undoubted progres. Thus, at Frankfort, as has already been mentioned in thee pagee, a central depos for the wale of fruit ham been founded, which offer itm mervice gratuitously. It accept offers from the growers, and hande them on an denands arise. It likewtee
arrangen in autumn large fruit sales, at which the supply as well as the demand is very lively. Last year the demand exceeded the supply, especially in green Nats, Cranberries, Apricots, Peaches, Mirabells, and Plams. At the commencement of August, 1894, at the central office, goods had already changed hand to the extent of upwards of 1,000000 kilos., almost exclusively berry fraits. The central office gives its assistance to all interested parties, to bugers as well as sellers, entirely free of charge. It does not even ask for the reimbursement of its own expenses. The enterprise thas is purely conducive to the pablic good, and is intended to promote German frait cultivation. Dating the fresent summer, it was intended to establish similar inetitutions in other places after the Frankfort pattern. It has been successfully initiated in a few South German cities. The wealth of the population has been advanced in some instances in quite a remarkable degree by the cultivation of fruit and berry trees.

The Cherry orchards at Gaben need only to be mentioned, as well as "the orchard of the capital," for such is considered the small town of Weider, situated between Potsdana and Berlin, on white sand-hills, near the River Spree. There the growing of fruit, notwithstanding the anfavourable soil, has increased wonderfally. The frait produced excels by its superior quality, and is preferred by consumers. The growers, who have organised themselves into trades unions, are now in possession of a fleet of their 0 wn, and daring the season hip their prodace every morning in their own steamers to the markets at Berlin.
Floriculture is also visibly extending in Garmany, especially, it is atated, eince special hothoase for certain kinds of plants have been more generally erected. The cultivation of plants amongst children in school has also been much promoted by the distribution of prizes, conaisting of plants, bulbs, flower-stands, thermometers, and other articles useful in gardening.

## The Week's Work.

## FRUITS UNDHR GLABS.

By Richard PArker, Gardener, Goodwood, Chichester.
WATERING the 8OIL OF the fruit.tree BORUER8.-This matter should alwaya claim attention at this season, and in particular this year after the excessive heat and drought experienced. A tree border which has been allowed to become very dry is almost as productive of shanking in Grapes as a very wet and cold one, and it is often from this cause Peach and Nectarine trees ahed their flower-bud when started into growth the following season. Providing good drainage is mecured, and the soil is filled with rooth in every part, it is almost an impossibility to afford too much water, as although the crop of fruit may be gathered, a great amount of moisture is required to sustain the foliage in a healthy state, and develop the wood and buds. If the urface of the border has become hard, the crust should be carefully broken up with a fork, so that the water may readily enter the soil. ' In gardens unprovided with pipes and hydrante, the work of watering in severe; neverthelens, in a season like the present, a atrenuou effort should be made to carry out the work, so much of next season's saccess depending on it proper performance.

8HIFTING PEACH TREE8. - The month of October is the beat period for lifting and transplanting these trees, particularly those in the early forcinghouses, where it in necessary that the trees become established betime in the new soil, and therefore in a fit atate for beginning to force in December and January. Peach trees mas be planted as soon as the growth of wood is fininhed, and if the work be carelally doue, no injury will occur to the foliage, and it is a great point to keep it in a healthy condition to the latest date. A preliminary to transplanting in to heavily water the aoil the night previoully, which will have the effect of retaining a gocd quantity of soil about the roots. Ia preparing aites for the trees, only uafficient soil noed be removed to allow of esough fren will being added for one venson, wide, rich borders only promoting the growth
of strong, unfraitful wood. A tirm soil, a border of no great width, and additions annually made a the trees seem to require it, afford much better resalts. After planting, one copious watering sbould be afforded, and the foliage heavily ayringed several times a day, with slight shade, if the tem perature by day be very high, but dispensing with ito use when the foliage no longer flags on exponan The branches ahould be but lightly fattened to the trellis at first.

## THES KITCEEN GABDIN.

By Johw Lambert, Gardener, Powis Castle, Welshpool.
LATE FIELD POTATOS.-All field crops should now be lifted, as the tubers will not be improved after this date by being left in the ground. Moreover, the most ahould be made of the splendid weather now prevailing almost everywhere in thew islands, to gather them in. The haulm may fint bo cleared off by giving it a sharp pall upwards miliat treading on the soil over the roots with the feet close together. The haulm should be put in mall heaps and burned. A few hedge brauhinga will readily effect this in dry weather. All hand should be employed in the early part of the day in digging a sufficient quantity which will provide work for the rest of the day in picking up, and thue afford some time for the tubers to get dry before storing them. If the Potatos which are first dug are the first gathered, the whole may be pataway freer of soil than if picked up directly they are dag op. In the case of those obtained from a freeh source for supplying a change of aets, I would recommend that these be the first lifted, and the required quantity of sets selected from the nicest shaped and middle-sized tabers. Of those that are left select what are fit for the table, and latly the mall and dineased tubers, the latter to be kept by themelves as food for pigs. Diseaved Potatos keep sweet for some time stored in tubs after cooking them, if a little salt be mixed with them when crushing them. If the crop hat to be carted some distance, it is advisable to put the tabert into acks having a plain mark on the outside to denote the grade. Those intended for table use should be put into the Potato-cellar or clamp. Seed-Potatos are best clamped after exposing them to the suu for a few days. Care shonld be taken to put no diseased tubers into store. When space can be found for them in the spring, get them out in good time, to prevent their growing mach before planting them.

EARLY BROCCOLI8 AND LATE CAULIFLOWER8, -From now onwards the plants in the quarters should be examined each alternate evening, removing any heads which are found fit for use, and covering ap those with leaves that have head forming. Those intended for lifting and replanting in pits of shed should have the root masses cut round with a bright spade, preparatory to lifting them later in the year. By doing this, growth is checked, and a number of amall roots form that readily seize on the soil into which they are tranoplanted.

GENERAL WORK.-The covering material for Ranner and Dwarf French Beans, which it is in tended to cover in the event of frost, should be in readinen for use at the shortest notice. Gathering should be made from each kind where no covering ap is done; and if these are kept apread ont thinly in cool, moist place, they will keep in a fit state for nue for a considerable period.

## PLANTG UNDER GLABS.

Dy W. H. Smite, Gardener, West Dean Park, Chichester.
HINTE ON WORK IN GENERAL.-No time hould be lost in getting all kind of planta which siffer from cold and wet into their winter quartert, makig a beginning with the more tender species. placed various houses in which the plants will be placed hould have the glass and wood wort wahed and the walla lime-washed, and zoured or mossy soil ander the atage cleared out, applying its place with clean gravel, hingle, \&cc. Early Chrysantheman be whose flower-buds are beginning to open, should if among the firat brought in, as the flowers spechief exposed to the dew or rain, slthough the chier if purt of the stock of Chrysanthemums will be betesto left out whilst the weather remains as it is atpres for Mearime, let evergehing be got in reanarearo for housing the plants. Fxamine the piants for eart wigs before bringing them into the houns-8 Canns thake will generglly disiodge these. Tree Citting tions ahonld be placed in a lightairy houe, admithing
plenty of air night and day in mild weather. The heary dews and moist atmonphere of autumn are conducive to the awelling of the flower-bade and the healthy green appearance of the "grass," and when the plant have been placed in the house, they should receive a light dewing overhead twice a day, and the pots be well agringed all round for a week or two afterwards, or the leaves may take on a yellow unhealthy tinge. Indian Azaleas are not cafe as regards most of the varieties if left ont longer than the beginning of October. These plants should receive a thorough syringing with weak tobacco-water, laying them on their aides on the turf in doing so. Epacrines should be removed to the cool greenhouse, or other light structure, from which frost can be excluded ; also Salvia. Eupatoriume, Genintas, Solanums, and Richardias. Mignonette will withstand a few degrees of frost without harm, but it will be safer to place it in cold framer, drawing off the light in fine weather. Ivy leaved Pelargoniums should be taken indoors, and allowed to flower. These are very pretty plants for conservatory decoration work in the early winter, and the plants may be placed in that atructare at once. They soon commence to show for flower. A good batch of Spiræas should now be potted up; and if the plants are required to flower early, they ahould be selected from those which have been cultivated on a south border, as being more likely to be thoroughly ripened. If this be done at once, the plants will soon lose their foliage, and may then be atarted gently, and thue had in flower by the end of the year. A batch of named varietien of zonal Pelargoniums, for flowering next ammer, may now be putin. If the old plant were planted out, wellripened cattings should be taken from them, inserted in small pots, and placed in cold frames, or on a greenhouse shelf.

## THE ORCHID HOUSTS.

By W. H. Wette, Orchid Growor, Burford, Dorking.
CENERAL REMARK8.-The hot weather lately experienced has been very favourable to a large number of specien, eapecially those that are deciduous or semi-decidaoas, and therefore requiring a thoroagh reat in winter. Other apecies have likewise benefited from the sun-heat, which is shown by their more than utually vigorous root action. Moreover, I have not observed any injury inflicted on Odontoglonsums, Mandevallias, Occidiums, and other apecies of Orchids which are subjected to a cool treatment, although on everal occasions it was imposible to kepp the temperature in the houses below $75^{\circ}$ during the hotteat hours of the day-in fact, on two or three days the thermometer registered $85^{\circ}$. Thin was the case in apan-roofed bouse ; but lean-to's facing north or north-east had, at anch times, a much lower temperatare, and a cool, ${ }_{3}^{2}$ humid atmosphere was eanily maintained. With such a night temperature as has prevailed lately, air ahould be admitted to the coolhouse, and anless the cold weather comes, no artificial heat may be necesary for some time. When frosty nights occur, sufficient warmth must be maintained by the boilers to prevent the temperature falling below $50^{\circ}$. While the present fine weather lasts, the day temperatures of the warmer divisions can be readily maintained at the proper degree; and during the night, the ventilators may be freely used if the hotwater pipes are kept a trifle warmer than in ammer. The warmth of the East Indian-house at night should range between $70^{3}$ and $75^{\circ}$; that of the Catt-leya-house about $70^{\circ}$, Mexican and Intermediatehouses about $65^{\circ}$, and on cold night $5^{\circ}$ less in each diviaion. It is a matter of importance that the temperature at night should be carefully regulated, but at times it is difficalt to forecast the weather, and flactuations occur late in the night or the early morning hours, consequently it is preferable to afford a little more warmeth when finishing up for the night than ran the risk of having a low temperature in the morning. If the temperature of the various diviaions falls a few degree below what is considered the proper standard, no water should be afforded any of the plante, or damping-down done before the proper degree of warmth is reached. In the East Indian-house are delicate $\boldsymbol{p}$ "cies, auch as Angrocum*, Phalmaopsis, Calanihes, Balbophyllams, Cirrhopetalams, Epidendram bicornatam, Oacidian Lancesnum, O. bxmatochilum, Caysis, Phsio-Calanthes. Phaius tuberculosus, \&ce, which are very aurceptible to injury by a cold moist atmosphere, evtn for a ahort time at this season, many of them being in growth. Cattleyas and Loelias are also plants whose half-matured bulbs decay very eavily if too mach water bo afforded, or a check is
brought abnat by a low temperatare at night. The bright unshine has increased the plague of black and yellow thrips, and unless these peats are diligently sought for and destroyed, many valuable plants will be dinfigured. There is nothing better for killing these insect than the Richards' XI, Vaporiaing Fumigator.

## THE HARDY FRUIT GARDEN

## Hhy W. Popr, Gardener, Highelers Castle, Newbury.

THE REPLACING OF UNBATIBFACTORY TREES WITH NEW ONES -Obervant caltivators of hardy fraits will have taken note of the trees and buabes which are grown in various modes in their gardene, and determined which of them might be superseded by other or better kinds or varietien. In some instances the trees will have become unprofitable through age or other causes, and the replacing of such by younger plants is a necessity that should not be overlooked or delayed. Vacant paces on the walls or espalips fences should be turned to use, if only a cordon be planted here and there. It is always advisable to have a remerve stock of young fruit-trees of the kinds grown on walle, viz, Peachet, Plums, Pear:, Apricots, Figa, and Cherrien. Sach a reserve stock il cheaply worked up by buying a few maiden tree yearly, and training them in the various methods of dwarf, fan, horizontal and riders. The asme remark holds good of bushes and standards of hardy kind of fruit. These treev, taken from the home nursery, and planted in the early autumn, feel warcely any check if the work be properly performed. As a rule, Apple and Pear trees remain in good health much longer than stone-fruits ; and, instead of uprooting inferior varieties, if the trees are fairly healthy and vigorous, they ahould be headed-back in February, and re-graited in the spring with better varieties. Trees of good varietiea of Apples and Pears, which are unhealthy or unfraitful, should not be bastily condemned, as it may be possible to reatore these to health and fruitfulness by paying due attention to rootpruning and lifting, and affording better drainage or a more suitable soil. A few cattings of Gooseberries and Carrants should also be atruck yearly, and then, if the young bushes are thifted and afforded a little more space every year or every aecond year, gap are readily made good, and new plantations mede.

WORN OUT ORCHARDS - The replantiog of an ancient orchard is commonly a mere waste of time and money, the better way being to break up and plantia new piece of ground. If a new orchard be decided apon, the actual planting of the trees ahould be delayed for a year or o, to enable the laad to bs trenched two or three spits deep, bat without bring. ing mach, if any, of the absoil to the surface, drained, and exposed at much as possible to the action of the weather, barning all roots and rabbith on the ground, and atcatering the ashes over the surface. If the noil be heavy, a liberal dressing of road-scrapings or plaster and old mortar, should be well worked into and mixed with the staple; and if of a light kind, a dressing of marl or clay should be applied, and allowed to lay on the surface till palverised by frost, when it may be incorporated with the soil by means of the plough and harrow, or digging-fork. In the spring, after manaring the land, a crop of Potatos or roote may be planted or sown on the land as a means toward getting it into a clean condition for receiving the trees. In Ostober, or as soon as treen can be lifted safely, the planting may be carried out. Standard trees may atand according to habit and style of growth, at distances varying from 12 to 20 feet; half-atandards and bushes on crab-stocks at a distance of 18 feet. Each tree must be ataked and loosely tied at first, and mulched with half-rotted manure as soon at the planting is finished. In heavy soils, which reat on clay, it may be sometimes advisable to increase the depth of available soil and thus keep the roots at or about the surface, to form an impervious atstion a few yards qusre under each tree, at a depth of 2 feet, and make mound of soil 12 feet in diameter, and 1 foot high, on which to pland. mound may consiat of the surface soil lacraped oward each station from thy intervening land, or

## THE ELOWER GARDEIT

 By Ballex Wadds, Gardemer. Birdsall Gardens, ForkoBPRING-FLOWERING PLANT8. - Where spring gardening is extensively carried out, the flower-beds ghoald now be cleared of their aummer occupanta.

There being more time at this eason than in the apring for performing the neceasary trenching and digging of the soil in the bed., this should be done. Beds which have been thickly planted ahould receive a heavy dresning of roten manure, with some charred aoil and abes from the charred rubbinheapm, all duly screened of large atones and rough materialy, before digging them. Bede of emall size ahould have the soil removed to a depth of two pits, refilling them with fresh moil and manare. The bed in which Hyacinth and other kinde of bulbe are to be grown, should be well drained by placing rough materials to the depth of 6 to 8 inches at the bottom, the layer of ail above being not lese than $1 \frac{1}{2}$ foot in depth. As aon an the digging is finabed, planting operations may begin.

ANEMONE CORONARIA. - The corm of this plant sbould be planted at about 5 inches apart, and covered with soil to a depth of 2 incher, previoualy prinkling leaf-soil and charred refuse about them. When the beds of this plant are large, they shoald be neatly lined out, and care taken io plant the angles of the bed. (If any) neatly. Seedling Anemones should be planced out as soon as possible into rich friable soil.

HYACINTHS may be planted 4 inches deep, ard from 4 to 6 inches apart, according to variety and other considerations. If other plants are to be planted as well, between the bulbs, more pace must be afforded-ay from 8 to 10 inches. Care should be taken to plant them at regular diatances apart. If the soil in the beda in very dry it abould be made firm and level by treading it evenly all over before planting, and afterward raking it. Plant bulb with a trowel or a atrong iron-ahod dibber about 4 feet long with a movable tread fixed on one side to regulate the depth of the holes. Before the bulbs are placed in the holes a handful of zand or charred refuse may be dropped into the bottom, the bulb keing then covered with the soil of the bed, aud made firm. Narcissus and Jonquils may be planted ia the name manner; Tulipe, Crocus, and other small bulbs may be flanted with the ordinary diober, the distance between them being regulated according to the growth of the variety. All bulbs require to be planted much closer together when planted in bede by themaelver.

CROCUS FOR EDGING8 of beds should be planted 2 incbes apart and 3 anches deep. Look out for mice after planting theae corma.
ranunculus, persian iris, Snowdropa, winter Aconiter, Scillas, \&ce., should now be planted; the three last named mould be planted thickly if used for edginge or designs on the lawr.

LILIUM CANDIDUM.-If these bulbs have grown in the same place tor everal years half of the bed should be taken up and replanted elsewhere, affording the aoll a dreaning of rotten manare or leaf-moulu. Plant the balbs 6 to 8 inches deep, and mix wood ashes with the soil when planting, this material being a good stimulating plant-food, either applied to the aoll or afforded in the water naed.

Fruit Growing in America.-Some idea mby be gained of the acale on which fruit-farming is carried on in America from the operations of one eatablishment alone, the Hals Orchard Company, which, in 1891, planted 100,000 Peach trees in Gaorgia, Daring April and May this year 50 men were occupied all day in removing excens fruita in order to allow the rest to have room to develop. They begsin to come to maturity in Jane, and from the 20 th of that moath $35 \hat{0} 0$ men, sided by 50 maler, were engaged every day gathering and carting a way, filling 4000 baskets in the 24 hours. Imperfect, braised, and scratched fruits, separated from that in prime condition, amounted to 300 bushels a day. It took from 525 to 600 baskets to fill a railway refrigerator van, and each van load represented a value, including cost of gathering, packing, and tramport, of $f: 00$. Fiom this single orchard 80 van-loads were aent awey this year. In Ifouston Connty the caltryation of the Peach alone giver employment to $3+107$ people. Frko, Sept. 24, 18!5.

## EDITORIAL NOTICE8.

Advertisements ahould be sent to the POBLIsEER.
Nowrspapers.-Correspondents sending newospapers should be careAl to mark the paragraphs they with the Editor to ses.
Lustratlons.-The Editor will thanlfully recoive and seleos photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plante, fowers, trees, dc.: but he cannot be responsible for loss or injury.

Local News.-Correspontents will greatly obligs by sending to the Editor early intelligence of local svonts likely to be of interest to our readers, or of any matters which it is desirable to bring uncier the notice of horticulturists.

CORREOTED AVERAGE TEMPERATURE FOR THE ENGU. ING WEEK, DEDUOED FROM THE OBSERVATVONS OF FORTY-THREE YRARS. AT OHISWICK.-62'.5.

The greatest benefactor to the
FASTEUA. man race in our age, or perhap $n$ any other, has been removed by death. On September 28 died Louis Pastrer. He was in his seventy-third year, and had been in failing health for some time. His own life's work then was done, but its results and its overwidening consequences are the inheritanoe of the ages.
Pastedr was by education a ohemist, by nature an experimentalist and a reasoner. His advent was timely. Men oould not fail to reoognise the progress that soienoe was making, but the majority asked, as they always have done and always will do, cui bono? They looked as many do atill, on the work of the nataralist as laborious triffing. Inoapsble of appreciating its purpose, they indulge in mild ridiculo on the patient labour of the observer. To them the accumulation of wealth is the main business of life, and anything that does not direotly lend itself to that object receives bat soanty respect. Pasteur, in the investigation of the problems put before him, sought after trath and trath only. He never sought to enrich himself. It was not the money-value of the results that actuated him. His observations were made at once the common property of humanity. But the practical men were, in this onee, not slow to appreciate the value of the knowledge thus placed in their hands. We cannot in this place sllude to Pastectes many dim coveries, nor attempt to gange their value. By his investigation into the canses of enthrax, and his demonstration of the meane of combating it,

Franoe, it is said, was enriched by an amount exceeding the war indemnity paid to Germany. The silk industry, on the verge of ruin, was restored in oonsequence of his researches on the disease affeoting the silk-worm. The cultivation of a pure unmired yeast, and the setting forth of the conditions under which brewing and distilling can be successfully carried on, have proved of enormous benefit to those industries.
The means he has placed in our hands for the prevention and neatralisation of diseases like hydrophobia, splenio fever, oholera, diphtheria, even if they be not absolute in their results, are sufficiently so to justify the applioation to Pasteur of the epithet with which we oommenoed this note. Following up the indications inade known by Pastrut, our surgeons, headed by Sir Joseph Lister, now perform with confidence and suocess operations from which even such oonsummate operators as Fergusson or Liston would have quailed, and which, indeed, they would have denounced as unjustifiable.
Pasteuris suocesses have been very largely the result of his patient stady of the minatest of living bodies. Whether we call them germs, microbes, bacteria, bacilli, spirilla, it matters not; the point is to observe the conditions favourable to their development, and, as Marshall Ward has done, the ciroumstances prejudicial to them. Their life-history has to be unravelled with all, and more than all, the minute acouracy that a detective would employ in tracing the oareer of a criminal. With the knowledge thas obtained a basis for experimental proof is afforded, and these experiments have, at we have seen, eventuated in the most signal benefits to the animal kingdom, and to the haman race.

To the praotioal gardener it may be of interest to point out that the "oultivation" of the germs, the seleotion of some, and the rejeotion of others, and other methods adopted in the study of bacteria, are, so far as prinoiples go, identioal with those that regulate the procedures of the gardener.
To the gardener and the agrionlturist, again, the results of the stady of the baoteria of the soil are of primary importance. We do not recall that Pasteve himself took up this part of the subject, but it is so intimately connected with his researches, that it is natural to associate his name in oonnection with them

The distinctions of race, oreed, nationality, from one point of view, are effaced in the case of such a man as Pastrua. We may congratalate France on her distinguished son, bat we feel that he belongs to humanity, not to any special country.
On the quay at Boulogne stands a statue of our own Jenner, raised by grateful and sympapathetic Franoe. How graceful and appropriate a thing it would be to ereot on our own shores a monument to Pastivin, in many ways the lineal descendant of Jenner.

Dendrobium Phalenopsis vaf. holo LEUCA.-The quantities of the handsome Dendrobium Phalmaopuia var. Schroderiana which have been received during the last few yeara have brought many fine varieties, and among them a pretty clase of light-coloured varieties, more or lens tinged with pale lilac, and which go under the common denomination, "delicatam;" bus the namber in which the sepals and petals are pure white are very limited. In the Gardeners' Chroniche, Docember 3, 1892, p. 668, Dr. Kränzlif describes D. Phalenopais var. Rothuchildiane-a beautiful white variety, with a faint flawh of pink, which flowered in Lord Rotescaind's gardens at Tring Park. Later, another white appeared, which wae called D. Phalmonopais var, alba, but in that were some pink lines in the
lip. The variety bololeaca, which wo illuthe fig. 72 , appears to be the first wholly white wiety and it was exhibited by J. T. Howns, $\mathbb{E}_{1}$ Beechen Cliff, Bath, at the meeting of the Orchid Committee of the Royal Horticaltaral Societ, Augast 13, when it was a warded a Firt-clua Cop. tificate; and the plant has aince passed into the rich collection of Elijar Ashworte, Enq., Harefald Hall, Wilmslow, Cheshire. Of other varieties in which white predominates, one of the most remart. able is D. Phalænopsia var. albo-purpurea, flowen of which we received from Dr. Jessop, Roundhes, Leed: (gro, Mr. Tyson), in which the flowen in white, with nome dark plum-coloured making on the lip, the contrast between the lip and the whith sepale and petale being very remarkable.

Horticultural Club - The following antho arrangements for the conversaziones for the und three month. October 15," Botanical Rublen in Lapland and Novaya Zemyla," by Mr. C. E. Pumos, illustrated by apecimens of the flora. Norember 19 " Fiowere, Fraits, and Planta ia the Life and io tho Home," by Mr. T. D. Fish ; and "Tae Frait Sapply of Covent Garden," by Mr. Geo Monro.

Gabdeners' Royal Bene volent ingtitution. -The Rev. W. Wiles has forwarded to the secremery the anm of fifteen gaineas, being the amonat of tho harvest thankegiving offortories in Shirley Cburchon the 29 ch alt., in aid of the Gardenera' Rojal Beenorlent Inatitation.
national Chrysanthemum Society.-a largely-attended meeting of the Geaeral Committee, presided over by Mr. Brian Wynne, took place at Anderton's Hotel, on the 30 sh alt. The ecretary, Mr. R. Dean, brought ud a circular relating to the Jubilee celebration in 1896, which had been approved by the Prenident, Sir Eidwin Saundies, and by Mf. J. Ritchie, the Chairman of the Board of Directorn of the Royal Aquarium, and which is shortly to bo insued; and reported that a Jubilee achedale of prizes is in preparation, and that some hadiome special prizen had been promised. Some interetiong correspondence from the Colonies was read; ons correspondent writing from Timara, Now Zeskand, said some very fine new varieties of Chyymathemam had been raised in that locality, and it wae hoped that blooms of some of the bent, frozen in iet, would be sent to England in May next. The Secretary reported the amount of prize-money awarded for Chryanthemums and Dablise at the September how ; and the award of certain medale was confirmed. The Secretary reported that he hed arranged with Mesars. T. S. Warg, and J. Cemai \& Sons, to clothe the two fountaine with fowers at the coming October show, provided the front held off, and it was agreed, that in the event of their beint able to do so, a aum of money ahould be allowed to each for expensen of cartage. Seventeen not membern were elected, inclading two fellown; and the Hertford Horticultural Society was admitted to affiliation.

Change of Date of the chebtepiele Chrysanthemum show. - We are informed by Mr. Nelson, the honorary secretary of this Society, of the fact that the committee bave altered the deto at which the show wat originally fixed. viz, Wednesday, November 20, to Wednesday, Norember 6, an alteration called for by the forward atate of tho flowers of the Chrysanthemam.

At the Cbyatal palace fruit Show.Country Visitor to Gardening Prewman, "You wem to know all about these things; will you tell m (pointing to dish of Bearré Diel Pears) who Beand 10? I find his name on lots of dishes of fruit. Whe is he? Where does he live?"-G. P. explains tha the word is French, and aiguifies batterlike, the variet of Pear with that word affixed having flesh of buttery texture, - $O$. $V$. (coratohing his ear in unsestion). "Ab, dang it! I might a' known that; bas mias bate the Diel to do with Pears? "一G. P. "Nothias it is merely a dedicatory name."-C. $T_{0}$ "Is thes 10? Well, I think l'll go now."

Caystalibeo Palaceio Fauita.- "Mr. Punch teartily congratulaten the Royal Horticultural Scelety on their gran l show of Britiah-grown fruit (none "made in Germany"), and the Cryatal Palace Company on the excellent arrangements made for the mont advantageous display of thene magnificent fruits defendus, for "forbicden fruit" they certainly

The Devon and Exeter Gardeners' Mutual Improvement Association.-Tbe anual business meeting of this Aspociation, of which Sir Stafford Northcote, Bart, M.P., ia president, wae held in the Council Chamber of the Guildhall, on Wedneaday, October 2, at eight o'clock, the Mayor of Eseter in the chair. The buainess to be transacted
eecretary was re-elected. We learn from the committee's report for the aession 1891.95 , that they are able to report very favourably of the work of the association for the past year. Toe number of members at present on the roll is 89 , and the balance in hand $£ 2916 s_{0} 2 d_{0}$, ahowing that, numerically and fanncially, the association is in a bighly atatactory

Fig. 72.-DEMDeobtum phalanopsis nololevca: Llownas pune witity (oes p. 396.)

Were, ss, mach to the diagust, probably, of the apothecaries and family doctori, the visitor could not teate any of the luacious specimen attractively set before him. They were all les pommes du vcisin, but though "forbidden," their appearance was anything bat "forbidding." It came to an ead laat Satarday, when it is reported that all the fruits were safely got oat of the building except one aleepy Pear, whom nothing could arowe.
consisted of the reading of the Socretary's and the Treasurer's report for the past jear, both of which were adopted; the election of a president, vico-presidents, secretary, treasurer, and committee for 189596 ; and the tranaction of other business, and to consider the modification of Rales 3 and 5, as regards date of the annusl meeting and the appointment of two secretaries. The new president slected is C. B. Coxlus, Esq., Hirtwell Hosee, Ezoter. The
condition. An avening was set apart for short paperi by younger member of the amociation, and this proved to be a wise departare, for, not only were the short essays themselves of conaiderable merit, but the intereat thas given to the janiors in the protession had a most anlutary effect on the asociation as a whole. The review of the papers for the year proved as intereating atormerly, and the discanion arining therefrom brought out many valuable expe-
riences in actual practice. The association having decided to affiliate with the Royal Horticaltural Society, are now associated with that illustrious horticultural body, and receive all the privileges which memberahip conveys, namely, copies of the proceedings of the society as published to its fellows, a transferrable ticket admitting to all its meetings and exhibitions, and the privilege of nominating one of its members to bs ranked as a Fellow of the Society. By reolution, Mr. Andrew Hope was nominated and elected to represent the Ausciation. The antumn progrnmme of the seasion 1895.96, comprises the annual business meeting on Wednesday, Oct. 2; the reading of a paper entitled "Fruit as Food," by Mr. J. I. Penablley, Exeter, on Wednesday, Oct. 16; on Wedneadey, Oct. 30 , a discuasion, having as its aubject, " Window Gardening, and the Solection and Treatment of House Plants," will take place; the Rev. Dr. Dangar, president of the Training College, will give a lecture on "Carnations," on Wednesday, Nov. 13; on Wednetday, Nov. 27, there will be a discasion on "Judging at Flower Shown," which will be opened by Mr. W. Rowland, of Parkerwell Gardenx; Mr. J. D. Nanecawen, Whiteway Gardens, will give a lectare on "Wild Gardens and Pleasare Grounds," on Wednesday, Dec. 11.

- At the Carnival held at Exeter last week in aid of the hospitals of that city, this Association was represented by a foral car artistically decorated with fruits and flowers, the sides being trimmed with Bamboon, golden-lesved Elders, Ampelopsis, and other gay-coloured foliage. In the centre wis an living representation of Flora which, as a tableau vivant, was amusingly effective, the make up being highly humorous. Flora would perhaps have been more eavily recognised by habitués of Covent Garden ; but he suatained the part with commendable gravity and gracioumens of prezence. What was hailed at the "gardeners" car" was quite a feature in the procession, and in the report of the Carnival Committee in " highly commended."

Mr. C.P. SLOCOMBE.-The death warannounced a few days ago of Mr. C. P. Slocombe, who was at one time a prominent etcher and a master in the National Art Training School at South Kenaington. He had for some yeara been in a bad atate of health, and had long been unable to take any active part in the work of his profession. All students who were at the South Kenaiagton School daring the years he held his appointment there, will remember him as an especially able teacher, and as an adviser who could almays be relied upon for frank and intelligent criticism. Globe, October 2. [Mr. Slocombe wat a pretty conatant frequenter of the Royal Horticaltaral Society's meetings at Kensington and Westminster, and contribated occarional illustrations of plants, flowers, \&c., to the Gardeners' Magazine, when it was edited by the late Shibley Hibberd ]

The Torquay Dibtrict Gardeners' AssoCIATION in a very vigorons body. The programme for the coming seasion, as we learn from the Weekly Mercury, Plymouth, September 21, isaued by Mr. F. C. Smale, the Hon. Sec., is a good one. Tha Cargeanthemam show will be held at the Bath Saloons towarde the end of October. Thiz will take the place of the exhibition hitherto promoted by the now defanct horticaltaral society.
"The history of Gardening in Eng. land."-This work, by the Hon. Alicia Angerst, will compriss a sketch of the progreas in the art of gardening in this country from the earliest times. The plan and deaign of the gardens, what flowers were grown in them, the chief horticultarists and the principal booke in each period are treated of, an well as the various ehangen in the culture of -fruit and vegetable gardenf. Numerous gardens atill in exieter ce are cited -az examples of each successive fathion. In the equapters dealing with the earliest times, many old recirde are quated, and some tranacribed for the first time frout original MSS. Lettere and hroavehold aceenate, and noten from private MSS. of the seyenteenth and eighteonth
centuries, are also here printed for the first time. The book will contain sixty-five illustration of gardens, from MSS., engravings, sketches, and photographs. The work aleo comprises a copious bibliography of printed books relating to gardening down to the year 1837, chronologically arranged, and a list of the authors, placed alphabetically; aloo a good index to the whole book. The Appendix consista of a reprint of the portion of the Parliamentary Surveys of Wimbledon and Theobalds, giving full descriptions of the gardens there in the year 1649. The book will be pablished by Mr. Bervard Quaritce, 15. Piccadilly, London, at a cost of 155 . if subscribed for, the price to be raised to a guinea on the day of publication.

Late Strawberries.-Laat week we noted a fact or two concerning the unseasonable fraiting of the Strawberry in the South; and now we insert a note taken from the Newcastle Daily Journal of September 26. Mr. W. G. Macfarlane, frait-grower, Alnwick, sends as aome specimen plants bearing fiae ripe Strawberries from his gardens. They were gathered from runners made this year, and are the product of a seedling Strawberry named the Dake of York; they are really what ought to be the crop of 1896 This is the nearent approach to a per-petaal-bearing Strawberry ever raised up to this time. "We begab," bays Mr. Macfarlane, " pulling on Jane 10, and we will have frait antil the plants are killed by frost.'

- $\mathrm{A}_{\mathrm{s}}$ an instance of the extraordinary weather which has prevailed in Cornwall this sammer, it is atated in the Daily Telegraph that Strawberries were on zale in Pedzance market on September 20. One gardener informed a correspondent that he had gathered a fourth crop this reason. Apple trees bearing fruit are also in several instances atill blooming.

Floral Decoration of Rallway Stations. -To encourage the caltivation of flowers at the railway atations on the Midland Railway Company's system, that Company, says the Morning Post, offered $£ 200$ in prizes among their atation-maters. There were upwards of 200 entries for the competition, and yesterday the firat prizs was awarded by the jadges to the atation-master at Matlock Batb.

Pomological Society, Boskoop.-At the meetinga in May, June, Jalr, and Aagast, the undermentioned plante obtained First-class Certificates:Sambacus racemosas plamusua fol, aureis, from Mr. K. Wezelenbarg, of the firm of C. de Voe, Hazerswonde; Picea pangens glanca pendula (Koster \& Co.), from Mesare. Koster \& Co., Boskoop; Crategus oxyacantha foliis sareip, from Mr. P. van der Kraats, Liz, Boskoop; Magnolia Alexandrina folia variegata, from Mr. J. Walraad, Jr, Boakoop ; Clematis M. Koster, from Mr. D. A. Kister, Boskoop; Spiræa Bamalda Anthony Waterer, iatroduced by Mr. K. Wezelenbarg; Cbamæsyparis Lawsoniana glauca Triompbe var Boskoop, from Mr. D. Grootenvorat, B stzoop. Azalea mollis Machtelina Alberta, from the firm of G. J. Alberts, Buskoop, obtained a Second-clan Certificate. Hydrangea aurea maculata, from Mr. K. Wezelenburg, Second-claes Certificate. Picea pungens glanca (Korter \& Co.), raised from seed by Mewra. Koiter \& Co.; and Taxus baccata semperaurea, from Mesors. O: © olander \& Hooftman, being plants fally worthy a Firstclass Certificate, could not have this award owing to their havirg been too loug in commerce P. A. Ottolander.

Sweet Pea Cupid.-Oar readers will remember the illustration of this beautiful dwarf white sweet Pean, exhibited on Jane 25 , at the Royal Horticaltural Society, by Mr. Doualas, for Memars. Bubpra. A photograph of portion of a field of seven acres is now before us, and we are aseared that it blooms from the middle of April or beginnink of May, till checked by the froat. Meases. Horst \& Son, of Howndeditch, are the ole wholesale agents. to the trade in Great Britain and the Aurtralian Colonies. The plant does notig grow over 5 inches in height:

Bouquet-holders.-Mr. W. Trisgder, of Cardiff, cells us that he has had in use for the lat fifteen years a similar appliance to that figured in our issue for September 21.

Apples in the United States.-The helan reports to band from the best-informed quartern in the United States are variable in their character. Some five States commercially interested in the frit atate that not more than half a crop is expected; retarns from fifteen others are favourable; some fem are about average, and othera are expected to yield in excess of previous years. Taken as a whole, the yield is expected to be in excess of that recorded for some years past. Peaches appear to have anfered much in certain localities, and as to the ultimute outcome of the crop, no one appears to apeak mith any degree of certainty.

Waterlow Park, Highgate.--We min in. formed by Mr. J. Pallett, the Saperintendent of this park, that the exhibition of Chrysathemma will be open to the pablic on and after Satardag, Oetober 5 , from $10 \mathrm{~A}, \mathrm{M}$, until duok.

> Nursery Notes,

## A Midland SEED FARM

Durinar a journey from Birmingham through the notorious "Biack Coantry" to Wolverhampton, the traveller's attention is inevitably engaged by the great chimney stacks as they belch forth volumes of vile moke, or are surmounted by a weird blaze now disappearing from sight, apparently from exhaution, and again starting out as if making a determined effort to rise higher than previously. On either ide of the railway, the face of the land is covered with huge atacks of coal, or with vast cinder heapa and refuse from the mines and ironworks. As far as the eye can see, the acene is of this natare, the arface of the earth is totally unused except for the purpore of depositing the miserable heaps of refuse alredy mentioned, and inotead the genias and enorgy of man has been devoted to obtaining the wealth hidden in the earth's bonom. Agricaltare in anch a district seems out of place, as indeed it it, yet it hu not been driven so far away as the traveller woald sappose.

Ouly a few miles from Stoarbridge Junction, a atation not very far from the two mentioned tomnt, are the Kiaver seed farm belonging to Mearnh. Webb \& sons, of Wordaley, and these are in the centre of a fertile country of the most pictareaque character.

The Establishiment at Wordslit.
Before inapection is made of the need farma, horo ever, the visicor is likely to be shown the eatabliah ment of Mesorr. Webb \& Sjas at Wordsles. The extent of the basiness done by the firm, and the sanual growth of the same, may be here in a measare estimated. Tae commodioas buildinge ased for the atorage of grain and various root-seeds, horticultaral and agricultaral, together with flowering balbr for the garden, tell to eme extent what an amoanh of produce has to be deale with. Nor is the preasti accommodation equal to the requirements of the basiness. Tae targe block of building that were until very recently known as the new store housen, will be soon supplemented by a nef and the equally large warehouse now nearing completion, the oniy fault of which, in the words of one of tresi managers, who find lack of atore-room to be a gera inconvenience, is that it is not large enough. Meari. Webb do a large reciprocal trade with their agrien tural patrone, and considerable apace is requiale for the atorage of Hops and wool, an immenve lot of which was in atorage a week or two ago. The bt the trade is an extremely variable one, and no donbut bat firm lose money on this erticle in some seasoun Before possibly the saccoeding onas compensateo in bould this past of the premies is hurriedly lefft; it nowed bo added that the visitor will ansuredty be mot meent
and best machinea for every purpose may be seen' and the manner in which they perform their work, whether it be cleaning the seede, or other operations, is surprising.

## The Serd Fabms at Kinyrr.

Those who see only the establishment at Wordaley, have not nor can they have the faintest idea of the beautiful, well-cultivated farms in the neighbourhood of Kinver, where Webbs' geed generally are tested and raised for atock parposes. It is a lovely drive from the head offices along these healthful country roada before Kinver is reached, and it being our firt visit, our surprise at seeing such fertile land found frequent expression; questiona also as to the locality were freely asked and as willingly answered. We are now driving in the direction of Kidderminster," said our companion; "yonder on the left is Sedgley Church, which is said to stand on higher ground than any other Church in Eagland." In this district, then, we drove round the greater part of the 2000 acrea of land that Mesmrs. Webb \& Sons devote in a more or leas degree to seed-raising, and a good portion of which is their own freehold. This is only a mall part of the land that is cropped annually to supply the needs of the business. The aystem adopted is something like the following: All seeds are raised, tested, and aystematically rogued by competent assistante on the Kinver farms, but the produce from this harvest is "atock" seed, and to a large extent the "stock" seed is given out to nelected growers in suitable localitie to cultivate for Messrs. Webb, who take all the produce, and it is this seed that is sold to cuatomers. In this way the firm entimates that they employ annually in the Uaited Kingdom and on the Continent over 18.000 acres of land for the production of their farm and garden seeds, bulbs, \&e. We do not intend to speak of the newer or favourite varieties of the different graing or roots, or other agricultural crop. Experimental work is annually done on the Kinver farms; better varietien of each crop are sought, bat the resulte are to be seen in the numerous catalogues that Measry. Webb ismue, to which we will refer those who seek auch information.

## Garder Serds and Trial-arounds.

The little town of Kinver, lying low under the heights known as Kinver Edge, to most persons in the Black Country is only less familiar than their own town. Excursion parties may be seen any day pasing along the one important atreet the place can boast, or climbing the "Edge." The farm Mesars, Webb possens nearest the village, and very close to the old but pretty country church, is called Kinver Hill Farm, and it is on this one where the trialgrounds are, and most of the garden cropi, such as Potatos, Peay, and other thinga, are grown. Many acres had been devoted to Peas, and upwaris of 230 varietiea have been grown for comparison with each other. Potatos also claim a large share of time and attention in this manner, and each year the firm send out fresh varieties, which they believe are improvementa apon previous ones. Such are Progresy, Goldfiader, Record, and many others. Tarnips, Cabbagep, and indeed all Brassicas are grown and tested in large quantity, and efforts are constantly made to keep each variety as trie to its typeas possible. Webb's Emperor [Spring] Cabbage has long been a favourite, and some capical heads were seen when theme notel were taken. Lettuces, Parsley, Onions, and every garden crop is dealt with; but we mast hasten to notice, if only briefly, the trial grounds, where a great variety of flowers were being tested. It would be useless to describe thene grounds, where mont thing are planted in nursery lines or beda much at they are in any other trial ground. What firat occasioned remark were some bed of Poppies, á very good atrain of the Opium Poppy, Papaver somniferam, atrong in stem, bold in flower, and inclading various pretty colocirs. Larkspurn were quite a failure, the extraordinary character of the early part of the aeason had spoiled the prospect entirnly. Some of the plante were coming rato bloom, "others
were only juat through the soil. The graceful but uhowy Clarkias had fared differently, and plant of a good strain, both in mixed colours and in pare white, were in bloom. Delightful were the Eachacholtzias, blooming profusely in the different shade common to the flower; and by a quantity of E. tenuifolia we were reminded of a very pretty cream-coloured Enchscholtzia, with dwarf good habit, and a particalarly free bloomer, that, although old, is eldom seen. It was rather early for Godetias in the Midlands, though they were blooming freely enough in the South. Mignonette in quantity and variety ecented the air very perceptibly. Webb' D warf appeared of good habit, very strong, and a free flowerer. A nice collection of Zinnias, single and double, in bloom, were testimony sufficient that the atrain is an excellent one. There were Sweet Alynum, Collinsia bicolor, and the white variety; Candytuita, of which Webb's Snowllake seemed far and away the beat, The plant were bushy, and the flowers pure white and good. The coloured varieties had come very true from seed. The atrain of Gaillardias known an "Eclipse," may be commended an being in every way satiafactory. The French Marigold had come tolerably true from need, and the dwarf tuft-like habit encouraged is very pleasing. Asters were not in bloom when we taw them, but trials are made of a large number of these as well as other things, which we must leave unnoticed. Large and mall plota of the natural and other grasses, and breadths sown from Webb's popular mistures of Town grasey, various mixtures for alternate hasbadry, \&c., should be mentioned, as they are of intereat to all.

The above are impresaions felt during a hurried visit to Kinver, where extremes mest in auch a manner that the Black Country well nigh encircles one of the greenent, most delightfal landscapenincluding lovely Eaville-the Midlands can boast. P.

## Home Correspondenoe.

aticklebacks-The following British pecies are known, and deacribed by Yarrell:-Gasteroateus trachurus, the common threespined atickleback, in salt and fresh water; G. semiarmatus, found with the preceding; $G$. leiurus, mooth-tailed, alto common; G. brachycentrus, short-spined, found in the streams, ponds, and sea of the north of Ireland; G. spinulosas, four-spined, found near Edinburgh; G. pangitias, ten-spined, found both in sea and rivers; G. spinachia, fifteen-spined, common around our sea-coast. In the Annals of Natural History for October, 1852, will be found nome very intereating accounts of the habit of the stickleback during the breeding eason, by the late Mr. Warington, of Apothecaries Hall, where I well remember seeing them in his aquaria. W. T.

ROTATION OF CROPS FOR THE GARDEN.-On carefully reading and weighing, at I always do, the commanications of Mr. Willis of Harpenden in the Gardeners' Chronicle, on p, 366 I was rather surprised to light on the following entence in the middle column near the top:-"It is well known that the Cabbage tribe will thrive upon land: mach too poor to grow a good crop of Onions and Carrots" I should be glad of a little faller explanation of the sentence, which is the only one I question, in the three columan of Mr. Willis's powerfally-reasoned article, Bat taking the phrane, "the Cabbage tribe will thrive " as equivalent to the ground growing "a good crop of Onions or Carrots," practical growere will not accept the sentence at in accordance with their experience. They would rather asy that of the three crope named-Carrots weuld thrive beat on the poorest land, Onions on soils of medium richneas, and Cabbages beat of all on the richent of all. Practically, many of the fineat Carrots are grown without manure; Onions receive from 12 to 20 tons per acre, applied in the satumn; Cabbages, from 20 to 40 tons per acre, and atill aok for more. After many years' experience and observation of thene three crops in garden and field, I cannot recall a case in which a crop of Cabbages suffered loas of weight from over-feeding. Rich manuren may at timen develop abnormal tendarnean in winter Cabbagea or thouaand-headed Kale, but this can hardly be the meaning of the enfence in quation. At the other end of the scale we all know how easy it is to feed Carrote into
bolting, the scale, or coaraeneas. While an to Onions high feeding lead them into bullneckednens and other unprofitable wrys, while poverty of soil dwar: Onion into picklers. While thanking Mr. Willis heartily for all his other teaching on rotation of crops for the garden, I hope he will be go good as tu throw some additional light on the alleged affinity of the Cabbage for poor land, which few of ui have ever meen in garden or on farm. $D . T . F$.

LIME-TREE MITE. - The Lime tree in thieneighbourhood are, and have for mome weeks, been infeated by hage quantities of mitea (evidently a pecies of the so-cailed "red-spider"). The under-surface of the leaves was first infested. These curled up and fell prematurely. The tranks then became enveloped in a silvery web, looking at first night like the track: of dry slime left by an army of slugg. Up and down this web the mites continually move. They now form large clastera around the base of the trunk like lamp of yellow rebre. The enclosed ancople will give a slight idea of their numbers. They wera taken off in one lamp, and although I dareasy there are a few millions in the tube, they are an it were bat a drop in a backet, compared with the myriad on the treep. Geo. Parish. [The Lime-tree mite, Tetranychas tiliarum. Ed.]

NARCI88US FLOWERING IN GEPTEMBER. - OR the 21 st December, 1894, I planted one handred bulba of "Scilly white," which bloomed well during the last fortnight of April. The foliage was perastent for a long time, after that of all other Narcisai had disappeared, and even now it remains are atill visible. About the middle of Auguat, new foliage began to appear, which is now 10 to 14 inches high, and very atrong. The first bloom-apike were observed at the end of the third week in September, and now (on the 30th) more than half the balbs are either in full flower, or thowing for flower. Is not this very unuaal? No doubt my garden is a very warm one, but no other Narcisua has behaved in this precocious manner (excepting three bulbs of $N$. poeticus, which have leaves 4 inches long, but no Howers). For the last week the an has been very powerful, the thermometer in the shade at halfpart 8 a m, ranging from $63^{\circ}$ to $69^{\circ}$. W. To, Bishop Teignton, South Devon.

A recent beed cabe, -An anonymone letter, treating of our recent litigation with Mr. Shephard appeared in the lant issue of the Gardeners Chronicle, and we aball be grateful if you will kindly, in the interests of justice, allow us brief space for a discusaion of the commanication in question "Agri-horti" (the nom deoplume under which the identity of the writer is concealed) directs attention to "a fact that seems to have escaped notice," namely, that the "plaintiff registered as a trademark a certain device (a sheep as a matter of fact) embodying the words 'Shephard' Kale' a applied to that particular seed." So far from this baving been lont night of, we were ammoned to appear under the provisions of the Merchandise Marks Act, and it was solely on this point that the case was tried and decided. Most practical men most endorse the common-sense verdict of the bench. From "Agri-Horti's" letter we gather that he conaider it desirable that the ale of a useful vegetable should be confined to the man who is fortunate enough to notice the natural sport, and who is sofficiently shrewd to promptly register the variety under his own name. Surely be cannot bave reflected on the vast injuatice of the greater portion of the haman race being deprived of a natural valaable vegetable-food, because they may know nothing of the raiser who cho to call the variety after himself. We would also point out that we never on any occasion made use of Mr. Shephard'u trade-mark and that we merely sold a variety by ite own name As your anonymous correspondent faila to see the analogy between Mophard 'male, Nutting'a Beet, Wheeler's Imperial Cabbage, \&cc. (all of which were mentioned in the case), we fear it will be bopeles to demonatrate to him the very decided difference between selling "Shephard" Kale" and "Shephard's Kale Seed." "Agri-horti" drawn attention also to a reportiog error, which previoully we had connidered anworthy of contradiction, on the excellent, oldfashioned principle of "the least waid the oonest mended." He say :-Ank Mesars. Carter or Satton if they would allow any one of the Cabbage tribe to go out for seeding again that was "ove year only" growa from their pripate stocks?" Now in this case our atock seed wes parchased directly from the raiver by our grower, and "Agri-Horti" " misappre-
hension probably arises from an incorrect report pablished in a local paper, from which prenumably the Gardeners' Chronicle report was taken. This reads:-"Mr. J. F. Edney, a farmer, of Weat Titherley, gave evidence to having bought aeed from Mr. Shephard. He nold (presumably sowed) the seed, and saved some, and prodaced from it. This he sold to Mr. Toogood as Kale seed." We are anable to say how the misunderatanding arose, but the true report thould read as it did in one of our principal papers-the Southampton Times:-"Mr. J. P. Edney, a farmer of West Titherley, said in May, 1892, and July, 1893, he bought from Mr. Shephard a quantity of Kale seed which he sowed. He anved the need at Mr. Shephard's request, but after it had been harvested he said he did not require it. $H^{2}$ sold a portion of it to Mesors. Toogood \& Son aa Kale seed." Ao to the quention of selec. tionalladed to by "Agri-horti," the plante were several times carefully "rogued" by our grower, who has a practical knowledge of the technique of the work. The newepaper reports did not mention that we had a namber of witnesses in court (though the magistrates did not consider it necemary to call them) including two noblemen's atewarda, who were all prepared to attent that it wea imposible to diatinguinh the crops rained from Mr. Shephard's and cur seed growing side by side. These witnesses bad farther brought with them opecimen-plants to illuatrate the complete similarity. Oae other point only, and we will treapase on your valuable apace no more. "Agri-horti" writes as though no similar case bad been tried, when he might hear of two or three with very little troable. Toogood \& Sons.

THE PREEERVING OF FRUIT.-Permit me to thank Mr. J. J. Willir, Harpenden, for hie courteous and unefal angwers to my questions to be found in Gardeners' Chronicle, p. 216. 'The answera carefully atudied show how it comes about that so much jelly and jam are apoilt in the making through breaking down the atructure, as well as lowering the quality of the fruit through overcooking, as well at overaugsing. Truly, it seeme that the chemistry of fruit-preserving needs teaching, as thoroaghly as the theory and practice of plant-feeding and landmanuring. D. T. Fiuh.
the alut of fruit. - Many kinde of fruit are over-abundant in come parts of the country, and much of it is sold at pricea hardly paving the cont of gathering, to way nothing of carriage. We are so accustomed to look on Great Britain as a fruit-importing country, that no one seems to have thought of our exporting fruit in seanons of plenty to leas-favoured countrie: in northern Earope. Why should not some of our merchante try the experiment of eending fruit nicely packed in boxes and basketa to Norway, Sweden, Iceland, and the Baltic ports by steamer leaving Harwich. Hull, Grimaby, Goole, Newcantle, and Sanderland? Apples and Pears would be eapecially suitable fruita to aend, and these, with Damsons, and other Plums that will bear carriage well. hould find a ready sale. Ireland, too, is badly aupplied with fruit, unlesa it be American at a late part of the teason; and it might be found worth the while to send ithedce in somequantity. Tomatos, Melons, Figs, and Cacumbere, in the height of their season, might be added to this list of our exports to northern ports. $M$.

THE ROYAL hORTICULTURAL BOCIETY.-It IA to be regretted that Mr. Miller should have concladed an otherwise admirable letter in last week's Gardeners' Chronicls by indulging in a meer at the expense of the recipients of various medals and other swards made at the ordinarg mestiogs of the Royal Horticultaral Society. Were it not for the public apirit laudably support thete meetings and the who do so laudably mpport these meetings, and that render the Drill Hall gatherings at once the most intereating as well a attractive of their kind regularly held in any part of the kingdom, the great charm incidental o the Societpi operations woald be wanting, and horticalture would be ahorn of one of ite brightent central attribates. It is news to leara from one "Who bas never been to the Drill Hall," and who is matter, that the not a apecially fit anthority on the matter, that thene numerous exhibitor: at, or supporters of, the Drill Hall meetings, reaide-or to une Mr. Millor's phrase-are planted in and around London. There are mowe of us old frequenters of all partm of the kingdom, and if exhitorn come from torious exhibite, have found just they have merithown to there have found just the same favour exhibite of tho as who beenide exhibited towarde the aneer is as unworthy an it is anjuat, Lond it is to be regretted that gardener so highly eateemed as is

Mr. Miller should have so far forgotten hinself at to utter it. If the award made at the Drill Hall are so highly prized, whether they be medala or certificates, that permons from a wide area are con stantly exhibiting meritorious, if not always new, objecta to secure these awards, it is evident that they are held in eateem everywhere else if not a Coombe Abbey. Why does Mr. Miller aver that the whole thing is a farce? If these awards are farcen, then are the labours of the Society's Committees farces, then is the Society a farce; and so too is horticulture. After all, the Societs and the Com mittees will go on their way, even though Coombe and rave. If there has been a grave mistake made in relation to the Saperintendent-and nearly all deplore it-vet that error will not overthrow the Society, which in far too firmly fixed in the extimation of all who love gardening. The recent wonderful how of fruit at the Cryatal Palace, even though the pecuniary attraction the Society could offer were mall, is marked evidence, were auch needed that though atorm may rage or errori be made, the ereat body of horticaltarists have in it ample confidence. Mr. Miller treats with acant considerati, the privilege guinea fellowe evjoy, just because he cannot utilise bis own. Why envious of other opportunitien, because he is debarred from enjoying hem? What other society offers more than tha Ruyal Horticaltaral Society dons for the money? There are two grand chowa annually, those of the Temple and the Cryatal Palace, each of three day uration. There are some twenty meetinge at the Drill Hall, where there is generally a charming little how; and the fellow may see all the beat novelties the year can produce. There is the conatant use and enjoyment of Chiswick gardens, always intereating and attractive to lovers of gardening ; and there re the copies of the Journal (not of Horticulture, Mr. Miller) of which there are, at leatt, three yearly iasues that represont carh value. So much for the Royal Horticultural Suciety. Do not let ue seek to acuttle the ship in our efforte to ave the pilot. $A, D_{\text {a }}$

TRADE MARK8.-With reapect to your remarka on p. 371 , there is no doubt the Trade Marks Act as it applies to seeds stands on a very ansatiofactory basif. Some years ago, we tpent neveral haodred pound in cros-fertilsing Wheats, and produced a number of varieties which were distinct and of considerable merit; these we sold in mall quantities the first season, but certainly not sufficient to recoup ourselves for the initial outlay. The next year we were met in every direction with the advertisements of farmers who had grown these Wheate and offered the seed at just about the price it coat us to prodace, and this in face of the fact that we had regiatered the brand as a trade mark. In our endeavour to atop theee announcements, we were advised that there was no remedy. Oar greateat complaint was, that not only did the farmers advertive the Wheat by name, but they also used the title of the originator, such as "Carter' Stand-up;" and although they grew the seed, no atepa may have been taken to keep it true and pure, yet it atill went forth as "Carter"s Stand-up," and if the produce turned out unsatinfactory, it cannot bat have mont deterrent effect upon the introducer. We are entirely with your correspondent, that the law as applied to trade marks for seeds is at present absolutely valueleas, and the only retarn one gets for the care and expense of raieing new varieties true and pure is the reputation Which aradually growe round a house of atanding. James Carter \&f Co.

The "Thorovahfare" Tree.-The gigantic Oaks of Sherwood Forest are remarkable for varioun peculiaritien. The Greendale Oat, which we have here denignated the "thornughfare tree," has a roadway through its trunk. This was cut in 1724 , and was wide enough for a carriage and four to be driven through it. This was actually done by the Earl of Clare, who laid a heary bet that he could perform the feat, and he won the wager. The dimentions of thic archway are noteworthy. Its height is 10 feet 3 inches, and its width 6 feet 3 inches; the circumference of the tree in a line with the crown of the arch wat 35 feet. The tree is reckoned to be at least 1500 years old, and it is now propped ap and braced together with chaine. There are many other Liant trees in this foreat, such ae the Major Oak. which is 30 feet in circumference. The spread of this tree's branches overshade a apace 240 feet across from side to side. There is a hollow in its trank big onough to hold a dozan persons atanding clone together. The People, Soptember 22, 1895.

## SOCIETIES.

## ROYAL HORTIOULTURAL.

Great Exhibition of Briti8h-aqown Fquit Palace,

September 26, 27, 28.

THis imporisnt exhibition was opened on the day we went to preni last week. We could, therefore only insert a portion of our report. The remainder, together with a ammary of the papers rend a the Conference, will be found in the follomia culumns:

DIVISION IV
ingle Dishes of Fruit Grown in the Open Air (Amateurn and Dessert Apples.
The fruits exhibited in these classes wore of the linder excellence; competition was numerous in almost erery clam, and this part of the exhibition was most satisfactory
Adams Pearmain.-There were ten dishes of this ninity staged, and the quality was generally high. The mol woceesful exhibitor was Mr. T. Turton, gr. to Jro. Has efreaves, Req., Maiden Erlegh, Reading, whpee fruits wer superior in size to any others staged; 2nd, Mr. McKenie, gro to F. W. Cornwallis, Esq., Linton Part, Mid atone; and 3rd, Mr. Geo. Woodward, gr. to Roger Leagr Esq., Barham Court, Maidstone.

Cox's Orange Pьppin. -This class is always largely oontested, and there were magnificent fruits exhibited. The he prize for this popular variety was taken by Mr. T. Turros, who had first-rate specimons, or he would not hare
beaten the other fifty exhibitors. The 2 nd prize went to Xb . S. T. Wright, gr. to S. Lee Campbell, Esq., Glewston Court Herefordahire ; and the 3 rd to Mr. W. Colline, gr, to J. E Borland, Eaq., Sutton, Surrey.
King of the Pippins. - This excellent Apple was shom almost as largely as the one just noticed, there being lorty-dwo dishes. Very great difference was noticeable in the degree o size and of colour in the fruite from different localitien Those from Mr. A. W Yatt, Hatton, combined excellent colod with unusual size; and Mr. Jno. TURNER, Brighton, and Mín S. T. WRIGHT, who were 2nd and 3rd respectively, hed fruits of capital quality.
Mannington's Paarmain.-These did not strike us an being of more than average quality. Mr. T. Turton had the bati and Mr. Potter, gro to Sir Mark Col Letr, Bart, Sevenoak was 2nd; the 3rd prize was
Maptail.-About twelve exhibitors staged dishes of thin variety, and Mr. Thos. Spencer, gr. to H. C. Morfst, Meq. Rose, took lat prize, being followed by Mr. A. W YaTT, lastoin and Mr. Buxton, gr. to J. A. Forstikr, Keq., Chertoey
American Mother was only shown in six inatances, bat mos of the fruits were of more than average quality, and the
 and to Mr. Thos. Spewcer, and the 3 rd to Mr. S. T. Wrigit
Reinette du Canada.-Mr. Gro. Woodward had firstratio speciment of this rathar large Apple. He was followed by Mr. Monro, gr. to J. L. Bưcenall, Eeq., Beckeaham, and Purk H. C. Prineep, gr. to Viscount Portacha,

Uclicield. There were seven dishes on the table.
Ribston Pippin is an invaluablo spple, and an masy an forty-three diahes wore staged, being nearly as many no them were of Cox's Pippin. Bamarkable fruits were included this large collection, and it was with aplendid specimens tha Mr. A. Dcock, Arun Gardens, Rudgwick, won highest honount Mr. McKevzie was 2nd: and Mr. G. Thompson, gro to Menso Mr. MCKEMZIE Was 2nd; and Mr.
Hosemary Russet.-Mr. P. CAVAKAGE, Boohampton Lave, S.W., who won 1et place for this variety, had good areag exhibition fruits; Mr. T. Turton was 2nd with smaller, mon highly-coloured fruits; and Mr. Bridges, gr. to W. L. BEDIEAD Eeq., Brentford, was 3 rd.
Scarlet Nonpareil found eight exhibitors, and the let priti was taken by Mr. Empson, gro to Mrs. Wharield, amplay Mr. Mckenzie
Worcester Pearmain, in about twenty-ane disber, loolet vary bright, the colour generally being good. Mp. I WAEETIELD, Bearsted, had fruits of extra colout, and wain Mf. Kluict, Lapgley, Maidotone, wat and Mease, gr. to A. TATF, Esaq., Leatherhesd, 3rards wore stand Any other varicely. - Thirty dishes or upwaras wrou of st, Edmund's Pippin, shown by Mr. MCKENzIE; a good dien Edmund's Pippin, shown Cy Merrin, gr. to the Hon. Q. Gravenstein, from Mr. C. Horrin, gro to and nice Jofleto from Mr. P. CaVAVIGE, Roehampton Lane, Jrd.

## Coorling Apples.

Aljoiston. -Of the dowen exhibitors of this excellent cooking Apple, the most succestal was Mr. McKErizis, excellent fruits: Mr. GEO. WOODW LED mades good 20e; Mr. P. Cavaraig was ard.
Gismarck. - Only an equal dozen exhibited dibhe we Bismarcl, an Apple that bas become fairly populat. 180 MCEENzIE had excellent fruits, and was iet; whan Mr. Goo WOODWARD had fruits of almost equal rindity; ad grd.
 boll by being extulated in sbout thition
marled difference is the quality of the soveral dishes，bus some Brat－clane specissens were included．Mr．C．Ross wa let；Mr．Newman．gr．to J．A．TULI，Enq．，Chertiney，2nd and Mr．T．W．Starilup，Maidatone，3rd．

Bramley＇s Seedling．－The bost dish of this varioty came from Mr．Ausfir T．Kıurice，and were large and good．Mr GET．WOODWARD was 3nd ；and Mr．O．ROSS，3rd．
Cellini Pippin．－There were firteen dishes of this very pretty and not leow useful fruit．The colour generally wha wel developed，Mr．Killicis，who was let，had fruits of large bize and of meolum colour：Mr．MCKenzie was 2nd，and Mr． Gro．Goudsmite，3rd．
Cox＇s Pomona．－There were about twenty－three dishes of this variety staged，and the fruits being good in size and of exceptional oolour，they looked very pretty，list，Mr．C， Ross： 2 ad，
WOODWARD
Duchess of Oldenburgh．－This pretty Apple is evidently but Jittle popular，oaly five diohos were show $a_{0}$ and two of there were very poor．Mr．S．T．Wriget was 1st：and Mr．G．H GonDWIN and Mr．S．Hainee，gra to the
High worth，2nd and 3rd respectively．
High worth，2nd and 3rd respectively．
Dum：lou＇s Seedlinq．－Mr，Brincwrlu，Mill House，Orsett Grays，was 1st，and beat twenty－one competitora．On the whole，this variety was exhibited in satiofactory condition． The 2ad prize went to Mr．C．Ross；but why the 3rd prize whe withheld we do not know，unless it was because most of the fruite were shown under the name of Wellington．
Ecklinville Seedling，－Although this large Apple is of soft taxture，and not suituble for long leeping，the variety is an excelleat one for mid－season servico．Out of seventeen ex hibitors，the successul one was Mr．Mc Kemzie；and he was
f illowed by Mr．GFo，WOODWARD，and Mr．C．HERRIN， f lllowed by Mr．Gro，WOODWARD，
Dropmore，in the order of their names．
Emperor Alexander，being shown in excellent condition， made a capital display．Mr．McKfwzie had the best among $t$ wenty other competitors ；this exhibitor was followed by Mr． Buxtor and Mr．GEO．WOODWARD．
Gascoigne＇s Scarlet Seedling．－Eleven dithes of this variety， equally well coloured，made a similar diaplay．lst，Mr． McKenzie；2nd，Mp，Geo．Goldsmite；and 3rd，Mpo Gen， WOODW $\angle$ RD．
Golden soble．－These fruits were in great contrast to the preceding high－coloured varieties，generally the quality was frat rate．Mr．QEO．WOODWARD took 1st position，Mr． MCKENIIE 2nd，and Mr．G．Garaway，Bath，3rd．
Golden Spirs filled six dishen．Mr．Woodward had excel lent examples，and Mr．Gozdemith was 2nd，followed by Mr．T．W．STARTUP，
Mr．T．W．STARTUP．
Grenadier．－Only two dishes were staged，and the let prize was withheld．
Havetiornden（Avev），This worthy Apple was ataged by aftese eshibitors；the quality of most of the fruite was very good．Mr．McKEnzie took the lat place，and the 2nd and 3 3rd prizes went 10 Mr ．W．Bannioter，gr．to H．ST．VINCEMT A Mrs，Eaq．o Westbury－on－Trym，and Mr．WOODWARD，
Lane＇s Prince Albert．－Mr．C．Ross with splendid fruito won 1 st prize from eighteen competitors．Mr．H．C．Prinser end Mr．S．T．W RIGET，took 2nd and 3rd places respectively． Lor 1 Derby，－A grand lot was exhibitod．The lst prize wa taken by Mr．GOLDSMITH；the 2ad by Mr．WOODWARD；and Mr．G．WAKEField，Bearrtead，was 3ed．There were twenty． two dishes．
100 d Groswenor was displayed by ten exhibitors，and we thought that the quality was not more than average．Mr． thought tuat the quality was not more than average．Mr．
WooDW ARD，however，had a dish of very good fruits，and he Was followed by Mr．Mc Keizie and Mr．R．Webe，
Lord Suffeld，which occupied the next pasition，is of much the anme coloor．There were twenty－four diblhes，and the prizes were taken by Mr．Turton，Mr．McKenzir，and Mr． J．E．Burton，Rr．to sir E．PAUL．Bart．，Twickenham，in the ame order．
Me．e de Menage is a very different coloured fruit．Mr． McKemele＇s dish was of very high colour，and the fruits from H．S．MOFFAT，Eeq，Goodrich Court，and Mr．C．Ross，who were zad and 3rd，were also of good quality．There were $t$ welve d＇shes．
Northern Greening．－Eleven diehes of this Apple were Shown，and thoee from Mr．H．C．Pringep，who was lat，were capital．The 2nd and 3rd prizes went to J．R．Brougenm， Req．，Carmhalton，gr．，Mr．W．Jones，and Mr．W．Cottrell． Newito Wonder is a very pretty fruit when seen in per－ fection．Mr．Goldsamte had exoellent apecimens，and was tollowed by P．Crowlex．Keq．，Oroydon（gr．，Mr．Harris）； mad Mc，B．T．Wrient．
Peasgoxd＇s Nonsush，perhaps，makes a more handsome display than any other Apple；size，form，and colour it combines in an unasual degree．Excellent fruits were seen in the eightoen diahes or so that were etaned．Mr．McKeNzIE wes lit，Mr，
 Tring，isd．
Potts＂Seed ing．－The best of fourtoen dishes was that from Thos．Ridaw ilio Eaq．o Orsett，Grays，Esoex．He was fol Mr，G．HELMA．CAVANiGE，who had very goad fruits；and Mr．G．Belmak，Lewes．
$\$ p_{t}$ ncer＇s Favourite．－There ware seven dibhes of this golden－ ooloured Apple，and Mr．WOODWARD won lst prize。 He wa followed by Mr．T．W．STARTUP and Mr．S．T．Wrioht．
SWring Cautle，exhibited in a score of cases，was bent froms Mr．C．A as；and he wae followed hy Mr．GoLDSMMTH，and Mr．J．Fisoi Hill，Watford．
Stona＇s．－Ton good and fairly oven dinhes of this large fruit were ahown，bat Mr．MCKEwzE won，and he was followed by Mr．WOODW AnD and Mr．C．Ross．
The Quean is a very protty fruit when eeen is the parfeo－ thon esbibited by the epesimens from M M，K．C．SAvpEH：the

Qod and 3pd prizes were talien by Mr．Mokevzif and Mt Goldemith
Tower of Glamis．－There were fourteen dishes，and most of them were of very fine quality．Mr．Woonward，who was lat，was followed by Mr．C．Ross and Mr．T．W．Startup．
Warner＇s King．－Mr．McKenzere had the beet dibh uf fruits， and of the other twenty－one exhibitors，Mr．WOODWARD and Mr．Wrioht were succesfiul for 2nd and 3rd places．
Waltham Abbry Seedling．－There wero five competilors，and the boat was Mr．T．W．Startup，who had five very fine truits．Ho was followed by Mr．MCKEMzIE，and Mr．G．T． Wriget．
Any other variety，－There were twenty－nine exhibitors in his class，and a good number of varietios were represented． The let prize went to Mr．McKenzie；Mr．Woodward，with apital Belle Duboise was and；and Mr．T．W．ATartup，who had Tyler＇s Kerael，was 3rd．

## Degsert Prarq．

Benper Diel．－let，Eapl Pfracy（gri，Q．W gthon），Syon Houce， Brentford，for examples，first class in every point．2nd，H．81． Vinceat Ampa，Feq．．，Westbury on－Trym（gro，Mr．Bandieter） whose four ware better coloured than the（Et prize lot，but it whose four ware better coloured than the 1st prize lot，but it
was dacking in size．3rd，Sir E．G．Loorr，Leonards Loe

Beurrt Hardy．－Of this fine Pour there were only seven ontries，and the samples varied greatly，both in size and in colour．1at，Roger Leigh，Esq，Barham Court，Maidstone （gr．，Mr．Wuodward），with very fine large fruits ：2nd，Mr．H． C．Prinsep，gr．，Buxted Park，Jckfiold；3rd，C．R．W．ADEANe， Esq．，Cambridge（gr．，Mf，J．Hill），fine fruit of high colour， that eeemed to us as gond of bottor than Mr．Prinsep＇s．
Beurré Superfin．－Of this variety thare were four entries， the lat prize going to Mr．G，WOODWARD，Barham Court；2nd， to Mr．Goldsmith，Leonard＇s Lee；and 3rd，to Sir W．Gear （gr．．Mr．Cotterell）．
Williams＇Bon Chretien．－This variety was，of course，long past its best，and the fruits shown were large．The best as regards condition merely，came from the Hon．W．LOWTH FR＇s arden，Wickham Market．The awards were as follow：－1st， Mr．Alfred dF．Rothechilid，Halton，Tring（gr．，Mr．R．C． Sanders）；2ad，Mr．O．HerRim．gr．，Dropmore ；3rd，Mr． 8pottiswools，Brighton．
C．nferen．e．－Only three dishes of this variety were shown， and Mr．G．Wo inward wae let，Mr．G．Wyteres ad，and J．W．Melieg，E•q．Ohingford（gr．，G．Nicholeon）， $3 \cdot d$.
Maréchal de la Cuur．－Five dishes of this variety wern nhown，and all from South Country gardons．lat，Mf．A Goldsmith，Leonard＇s Lee，with very fine examples：2nd， ．B．D．Wivgrield Digbl，Esq．，Sherborne Castle，Dorset
gr，Mr．Pragnell）；3rd，Mr，G．Woodward．
Doyenné du Comics，－Nine dishos of this fine early Pear were exhibited，all boing of remarkably good quality，although
difforing much in mize．1ut，Mr．GovnampTI：2nd，Mr． $\mathbf{G}$ ．
 Woodwar
Derronilear，－Of this Pear there were mistaen entries，savaral of them being of the usual brilliant crimson and russet tints seen when the fruit is at its best，and none were deficient in aize．The 1st prize went to a dish much less ripe than most of the others，probably owing to its being epslier grown，
 Colline）；2nd，Mr．J．8ims，Maidstone，of very high colour 3rd，Mf．日．Goldsmith．
omile d Heyst，－Foar dishes of this variety were tabled， varying much in the size of the fruits．Grandly－growin examples came from Mr．©．Wuodward，1st；from Mr．A． Goldsyirte，and；and a dish of rather undersized ones from Mr．J．Nowetic，A bergavenay．
Fondants d＇Automne，－Of this variety eight dishes were slown of greatly rarsing marit．The 1st was show a by Mr．J． Grbyov，gre，Chippenham；2nd，M
Dorking ：Jrd，Mr．H．C．Prinsep．
Glout Morcean．－Eight disbes were tabled of fairly evan quality，1st，Mp．G．Goldbmite；2nd，Mp．W．Cottereld ； 3ed，Percy Lawrencer，Earoo Clapham Part，S．W．（gr．，Mp． C．W．Chard）．The samples came from widely separated parts of the country，as Bath，Strestham，Tonbridge，and Shipton－ on－Stourp．One exhibitor had shown Beurré Bachelier under On－Stontip．One
Josephine de Malines．－There were nine entries in this cla日3， and the fraits were of very varying size and appearance．lat， Captain Carstairs，Mewbury（gro．Mr．C．Ross），highly coloured fraits，large and clear in the akin；2nd，Mr．BA MIETER，W eistbury－on－Trym ；3rd，Mr．J．Hille，Cambridge． Lomise Bonne of Jersey．－This was a large exbibit，the dishes aumbering $t$ wenty－four，and most of them were of good
size and bright colour．1st，Mr．$G$ ．GolpsMrit ；2nd，Mr．W． Kinge，gr．，Gatton Park，Reigate；3rd，Mr．J．Nowell， Abergavenny；this lot of fruit beating even the wianin Suseex diah for bigh colour．
Marie Lowise．－Of this favourite Pear twenty－two diehes were shown，some being ripe，whilst others watiod $t$ wo of where wooks yet to makisp them eatable．list，Sir $\mathbf{E}$ ．Pavi， Bart．（gro．，J．E．Burton），with large，clenrakinned examplee， etill green ；2nd，Mr．G．Goldsaititi ；3rd，Mr．H．C．Prtwaep
 C．Moffatr，keq．，Tonodriche．

Pitmaston Duchess．－－Of this showy，it not particularly good Pear，twenty－uix dishes wore ahowa，including neveral of large size，but nothing of superlative bigaess was noted．The Anest were thowe ahown by Mr．J．Cowlev，who wat
Mr，G．WOonW ARD，2nd．Mr．COTTEMELL Was 3rd．

## Drife Fruits．

It is a pity that these clasess were not taken up hy nore com－ petitors，as it is now gonerally believed that in the event of more extended hardy fruit culture in this country it will be increasingly important that in some measure we should apply the syatem of fruit preserving to largely practised by conti nental growers．Sufficient was shown notwithetanding to demonstrate to visitors who had not before seen fruits treated in this manner，that good results have already been obtained in instances where the system bas been tried．All the fruit bhown in the following classes must have been grown and dried in the British Islands．
The lst class was for a collection of dried fruite，and Mr W．A．Trotter，Ledbury，whe awardel the lit prize for a collection，principally composed of Apples either as rings or cord，or whole fruits．Varieties so trented were Golden Noble，Hawthornden，and Flower of Herts．
Some attractive－looking＂ringy＂of Apple Galden Noble， recured another lat prize for Mr．Trotter，in the class for 1 lb ．weight of Apples alice 1．Thore was no competition in these two classes，but in the next for 1 lb ．weight of $\Delta$ pples， driod wholf，Mr．Trotrer，who was list with good－looking ruits of Flower of Herts，was followed by Mr．R．W．BuLL The best exhibit in the class for Plums，was also from Mr TROTTER，who exhibited a variety of this fruit all of inviting appzarance．Both Plums and Damosons were included some dried during the present season，and others in 1891 W．Bull was end．Cherries，dried whole， 1 lb ．

## DIVIGION VI．

## Spectal Prizes．

The Worshiptul 0 mpany of Gardeners offered three prizes for nix varieties of hardy fruits grown in the open air，two gallons of each，at least two kinds of fruit to be represented． There were four exhibitors，the 1at prize going to Mr．S．H． Goonwin，Mereworth，who had akips of excellent fruit of Lady Henniker，Cox＇s Pomona，Loddington Seedling．Blenheim Orange，and Cox＇s Ocange Pippin Applea，the latter particu－ larly fine ；Dojenné du Comice Pearn，a splendid lot of fruit， very even，and finely finiahed．Mr．G．Trbsutt，Isleworth， was 3nd，having Lady Henniker and King of Pippins Appler， Buronne de Mello and Louise Boane of Jerey Peara，Belte de Septembre（Autumn Beauty），and Sandali＇s Pluma ；a more varied collection，but lacking the superb finish of Mr．Goop－ Wri＇s contribation．Mr．A．W YATT．Hatton，Hounslow，came 3rd ；he had Pitmaston Duchess and Durondenu Peare：Duches a＇ Yavourite，Yellow Iagestre，King of Pippinm，and Cos＇s Oraage Pippin Apples．
Mr．A．Wrirs apecial prizes for huhtl of Apples （ 12 lb ），of a cooking variety，and half a bush il（ 30 lb ．） ages as maple，picke）for market in as many pick－ preking to be statei，the ；cost of packages and method of and privato gardeners，brought seven competitora fteurs prize going to Mr．Orindrod，ge．to P．T．Philitpy．Eel who had his fruit packed in three ordinary oblong hampers three layers in each；the two lower layers packed with the onse of the fruits downwards，the upper layers on their sidea each layer kept secure by pads of wool placed to fill up
the spece；the coat of the baskets， $2 s .6 d, 9 d$ ，and $8 d$, as they varied in size and quantity．The baskets contaiaiag the culinary Apples ware lined with atiff brawa papar，inter lenved with bluo，and the frait was each wrappel in tho latter． corrugated peper，interlostred with slue sel laid over the top of each basket when filled，then wood－wonl， and the lid fastened down．2ad，Mr．Cotterell，gr．to sir W． Gear，Tonbridge，who had carefully graded fruit in bozas． One containing Pitmaston Dachese Poars，and one with Wor cester Pearmain Apples packed in coloared paper and wood． wool，the coet of the boxand packing for the Pears was $6 \frac{3}{3} d .$, and that for the Apples，ad．Though anly ane prize was offored，and prize appeares to have been awarded to Mr． Cottraell．
There wore ais competitors with a packago，basket，or therwize of 12 lb ．of Graper received by rail．The lat prize went to Mp．G．Cooper，Sunninghill，who had packed（apps－ rently Groe Maroc）in an ordinary stout white wicker Grape baaket，lined with soft paper，the banches carrying a benutiful bloom lying close to each other，the stemas of the bunches recurely sastened to the rim，and which，to all appoerance． wight bave been carried any distance without disturbance．
given to the packing. 2nd, Mr. J. Gore, Polegate, packed in much the eame way, having the same varietie3, but as far as much the eame way, harised no particulars of cost. 3ed, Mr we could see, he $\mathbf{H}$ Soureser Eastar Costle similarly Harris, gr. to Lady H. Somerser. Eastnor Castle, similarly packed. Gros Maroc and
varieties of Grape emploged.
There were seven competitors in the class for the best picked box or packages of Peaches, twenty-four fruits, received b rail. Mr. W. Wells, gr. to F. G. Arbutanot. Esq., Bexley, took the 1st prizs, having a layer of fruit, each wrapped in tissue paper, and packed in wood-wool, the cost of box and packing. 8 d $d$, an ordinary shallow deal bor being employed. 2ad. Mr. R. Grindrod, who had a similar box lined with coloured papar, each fruit in two welps of soot paper, an coloured papar, each fruit in two weips of sotionaper, an packed in moss; no particulars as to cost suppias. Pentney, gr. to A. J. Howard, Eaq., Isleworth. wh mod-
wrapped his fruit in soft paper, and then packed in woodwrapped his fruit in sott paper,
wool; cost of box and packing, $7 \frac{1}{2} d$
There were several competitors with a box or other parkaye of ripo Pears, twenty four fruits received by rail, and Mr. W. Wells was placed 1st, with Beursé d'amalis Pears, packed in wood-wool, the esst of hax and material, 8td.; 2nd, Mr. A. bor and packing, 4d.
The prizes offered by the Vegetarian Federal Union, for selections of specimens of fruits, nuts, grains, \&c., suitable fo growing on a 2 -acre plot, did not bring any competition, so far as we could learn.

## Misceilaneous Fruit.

Among the ron-compretitive collections of fruit, that from Messrs. JAs. Veltch \& Sons, Royal Exotic Nurseries, King's Road. Chelsea, was conspicuout. On one table was a remarkable exhibit of Apples representing a good number of varieties, which, from the qualities they cossess, are the best that can be selected, and each of these was ishown in excellent condition. Another table contained a collection of large and choice Pears of the best varieties, and individually the dishes were excellent
Capital fruits of Laste Devoniensi, Peach from a south-west wall were shown, and sprays and fruits of Rubus laciniatus, a first class Blackberry, also Alpine des Quatres Saisons Strawberries, White Grafes, Currants, Damsons, and ornamental varieties of Crabs. Sprays of the new large Winter Cherry (Physalis Francheti) were roticed also (Highly Commended).
Meskrs. Jno. Peed \& Eons Roupell Park Nurseries, Norwood Foad, London, S.E., staged a collection of Apples and Puars well leserving of remark (Commended) ; and from Messrs. CHas, Ler \& Sos, Hammersmith, a similar collection was CHas. LeE a Sos, Bammersmith, a similar collection was quality (Very Higoly Conmended). The Australian Irrigation Colonies were represented by some Mildura Lemong, and Coloaics were repre
Measrs. Jno. Laing \& Sons, Stanstead Nurseries, Forest Hill. S. E., coverel a cable with remarkable Apo'es and Pears is a number of varieties. In large baskets of Apples and dishes of the same, were splendid Cellini, Cux's Orange Pippins. and Washington (Very Highly Commended). Mrs. B. Wells, Crawley, Susex, had a small collection of Applez, and exhibited a fruit of Peaggood's Nonsuch, grown by Mr. Mortar, Upper Norwood, said to weigh 1 lb .10 oz .
An interesting collection of fruit was exhibited by Mr. Whil Taylor, Hamptod, Middlesex, which iccluded Apples and Pears in variety, most of them good in coloup; Coe's Golden Drop, Grand Duke, and Belle de Septembre Flums; and bunches of a hardy Grape, named Reine Olga de Wiirtemburg, recommended for open walls.
Mr. Owen Thomas, gr. to Her Majeaty the Queen, Windsor, exhibited about 100 dishes of Apples and Pears, most of them being of first-rite quality. No attempt had been made to arrange these in the form of a Trophy, as was done at the exbibition last season (Very Eighly Commen:ed).
Mr. JoHnson, Hager Hill, Ealing, had a stand, where he Exhibited specimens of his Mushroom spawn; and another stand was devoted to the display of Orr's Patent Storing-trays for fruit or other light articles. These wooden trays are made in an ingenious manner, that when fitted together, they form a substantial stand, and they are easily pucked for traneit.
The Hortienltaral College, Swaniey, showed forty-four dishes of Apples of favourite varieties, several, viz., Bramley's Seedling, Feapgood' Nonsuch, Emparor Alexander, Gloris Mundi, Melon, Councillor, Norfolk Beaufn, Wathington, being above The usual atandard of quality.
Miscollareous Exhection of thens. Felcoe RTDEA, Orpington. Kent, centa collection of twenty-one dishea of Tomato Duke of York, a form apparents of Sutton's Perfection. The fruits smootb, rogular as to size, and ripe, each dish held nine fruits. Au excellent exhibit.
Messrg. Sutron \& SOns, Reading, showed an enormous screen, 6 feet high and 60 feet long, on which were displayed fruite of each of the varieties of Tomato grown by them ripe Was a good method of showing the fraiting capabilities of the different varietifs. but on the whole it struck us as being overpowering in extent and in the mass of vivid colour. (Yery bighly commended.)
Nowa Seotian Apples were thown by Megsrs. Nothard \& Lowe, Cotton's Whanf, Loadon, E.O. The varieties were Cherenataiv, alad Bank's Red Gravenstein, a smaller fruit than Mr. W. M. Wher very bright looking.
Vavorite in nine examples, some very prettily netted Rarl'a bat alightly. A Yote of pies, some rery prettily netted, others

filled with fraita on maiden trees in pots, two large tabies bateets. A great mound of Bismarch Apples in dishes and centre fi one of the tables, and was flanked by two gro the
upright Cordons, loaded with fruit of the same variety Of fine size were Apples, Jubilee (new), King of the Pipping, Coz's Pomona, Hawthornden, Atalanta, Warner's King. Betty Geeson, Bramley Seedling, Ribston Pippin, Lucombo's Seedling, Mère de Ménage, Ecklinville, Washington, Yorkshire Beauty, Nanny (the famous Sussex App'e) Sandringham, Duchess of Oldenburg, and Cellini. (Very highly commended.)
Messrs. CHeal's exhibit of Pears inciuded fine samples of Duchess de Mouchy, Abel Fetel, Doyenné du Comice, Beursé Diel, Beurré Hardy, General Todlebon, and Duchesł de Nemours, bis stewing Pea; Csaseiller de la Coap, Gloat Morceau, Laise Bonae, Lêjn Leclerc, and Pitmiston Du:hess.
Messrs. W. Paul \& Son, Waltham Cross, had a table thinly aid out with dishes of Apples and Pears of generally high quality. Of Pears were remarked Beurré de lassoanption, Doyenné Boussosh, Beurré Diel, Frederick of Wirrtemburg' Mrie Louise d'Uccle, Vicar of Winkfield, Beurré Bachelier Yan Mons, Léjn le Clerc, Merame Treyve, Glout Morceau, \&c. Of Apples in fine example, the following were (habeth, Waltham Abbey Seedling, Lord Werby, Beauty Waltham, Duchess' Favourite, Forge Wealthy. Cox's Pumona, Reinette du Canada, stone's, Bis marck, Stirling Castle, Emperor Alexander, Warner's
Cellini (Highly Commended), King of the Pippins, \&c,
Messrs. S. Spooner \& Sons, Hounslow Nurseries, Middlesex exhibited a group of Apples and Pears in considerable variety The quality was highly commended.

## Miscellaneous (Flowers)

From Mr. Thos. 9. Ware, Hale Farm Nurseries, near Tottenham, was exhibited an extensive display of Dahlia blooms, including most of the sections, each of which was well represented, considering the advanced date in September A collection of Begonia plants in flower, single and double varieties, was also staged by Mr. Ware.
A group of Begonias in flower, and Chrysanthemums, also cut blooms of large-flowered Chrysanthemuma, exhibited by Mr. H. J. Jones, Ryecroft Nursery, Lewisham, was vary

Messrs. Wm. Cutbuse \& Sons, Highgate Nurseries, hondon, N., showed a large number of blooms of a single Dahlia, named Watford $\mathbf{B}$-auty, orange-coloured, with scarlet ring round the diss. Also fruits of their Polegate Seedling Tomato, and fruits of Cutbush's Green-flesh Melon.
Messrs. Jno. Laing \& Sons, Forest Hill, London, N.E., be sides a few orchard trees in pots, exhibited a very tastefully put ap group of Caladiums, Begonias, Dracæuas, Ferns, \&c The Begonias were of the ornamental foliage section, and ia c uded a few very attractive varieties. Caladiums and Crotons also were well-grown and of good colour.
Messra. WM Paul \& Son, Waltham Cro: Nurseries. Herts who seem to induce their Roses to flower long afier bloom have disapjeared from nooit gi-dena, exhibited a collection of cut blooms from varie ties specially good for late blooming. fow fruit trees in pots carrying fruits from these nurser kewise deserce remark
Messrs. J. Cifesf \& Sons Lowfield Nursery, Crawley, ix hubited stands of Dahlias of a variety of typea-Pompous, Cactus, decsiutive, show, faney, and single-flowered,
Messr3. J. Veltur \& Sows, Chelsea, showed Magnolia 100 , 1 and B. Hakodate, a new wapanese species, for comparison. The berries of the latter of a brighter hue, being scarlet instead of crimson.
A large collection of harly flowers was shown by Mr. Lad Hams, the Shirley Nusseries, Southamptoo, which included buaches of th-ir Perpetual link, very fresh and nice for so late a date; hhus glabra laciniata, which dies off of ri.h colours, \&c.
Mesers. W. Wood \& Eox. Wool Green, N., showel a collection of horticultural sundries of the usual heterogeneans

## The Conferences.

At the Conference on Thursday Edmund J. Baillie, F.L.S. of Chester, presided.

## New Freits of Recent Introduction.

Mr. Buntard read an exhaustive paper ou new fruits of recent introduction. He found some difficulty, he said, in defining the word "new," but he adopted the term for convenience, and he added that his remarks would be based upon his own persoual experience, and not on hearsay.

## Arples.

Dealing first with Apples, he said many fine fruits had come to the front. In dessert sorts they had the Beauty of Bath, an August fruit of great beauty. It was rather acil, and would, he thonght, prove more of a market fruit than a garden variety; Next came the Sepitember Beauty, one of Laxton's seedlings. This had a very rich flavour and soft texture, and was worth culture, althongh not a great bearer till it gained age. No early dessert fruit of late years laad taken the public taste like Larly Sudeley, as for perfume, colour, Havour and beauty, it took precedence of all the August and September kinds. The Armorel was a little russety well-flavoured Apple; it bore freely and would be valuable where very
late fruit (May) was required. The Christman Pearmain, to be sent out by his firm, was a soft.
fleshed, briskly flavoured Pearmain. good grower, and a regular bearer. The fibe dessert Apple, South Lincolu Pippin, had been purchased by his tirm, and it would be sent out in 1896. This would succeed where Cor's that old and fine variety. The Okera pretty rosy salmon fruit, in perfection in Sep. tember and October. It was elegant on the table, and of fine, brisk quality, and of a curious egg shape. It was a good grower and fair bearer. It required to be laid up to ripen, as the flesh man hard when eaten fresh from the tree. The Myy Queeu, although certiticatel many years sinee, wis now little known. It was a capital late deseert kind for February and Mareh, and a great bearer. The Wealthy was an American variety, with oof flesh and pleasing flavour. Its fruit was of a lorely crimson, and was in perfection aud profusion in
October. Williams' Eavourite was an Augus froit of great merit. It was a good grower and protuse bearer, and coull be highly recommended. These appeared to cover the new dessert novelties, but many older aud little known varieties should be noticed to complete the group; such as Roundmay Maguom Bonum, the finest flavoured dessert apple, Calville Rouge Précoce of great beauty with aromatic flavour and a good bearer, Allen's Ever. lasting, an old kind, little known, but of the finest possible quality, the tree being a close grower and free bearer.
In Culinary Apples there were more novelities such as Early Rivers, a fine variety bearing well at Sawbridgeworth. It might be described as a late Suffield. Hambling's Seedling was a large fruit that would prove a graud late variety. It was of vigorous growth, and for garden and orchard planting would prove an addition, as large culinary fruit was scarce in March. The Byford Wonder was a late heavy kind which had been sent out, and well shown by the Hereford nurserymen. Apples of this class would always be nseful atter Christmas. Saltmarsh's Chelmsford Wonder should prove a useful late cooking sort. Vicar of Beighton was a handsome fruit fancied by their old friend the late Shirley Hibberd; but it must be coudemued, as it cast its fruit prematurely, and the tr ce was, moreovel, very liable to canker, and wa in cawkwarl grower. Pearson's Newton Wonder wh vigorous orchard tree, and restricted on the Paradise Stock was a very free bearer. He anticipated that it, with Branley's Seedling, would bash the tender and much be-cankered Wellington ont of our orcharils. It was a really graad neel variety. For that graud late variety-Belle Pontoise, which kept into May, they were iodededed to Saw bridgeworth. Mrs. Barrou was distinct in growth to any other, aud would prove mond valuable for cultivation in restricted gariens
Tyler's Kernel was little known, but it formed s vigorons orcharit tree, and would probably prodee twenty-five bushels. White 'Transparent was very lovely and useful first-early kitchen
Its primrose colour aud capital cooking quabities ande it worthy of the Award of Merit which it tained. The new sorts, Duke of York and Bow hill Pippin, to be seut ont by his firm, would take a good place by-and-by.

## Cherries

Coming next to Cherries the writer said that in this department new kinds were not plentiful, bul the honour of introducing some good sorts with Messrs. 'T. Rivers and Sous, whose Bigarreatl, Francis, Cleveland Bigarrean, Ludwig's Bige; and must rank $A 1$ among the White Heart the black Black Hawk, Géant d'Hedelfingen among the blalso oues, Windsor, an American red-black, Cherties ikely to prove uscful. Among early band althong Rivers' Early quite took the lead,

## Nectarines.

Nothing Messrs. T. Rivers \& Sons had iatto up to their group of Nectarines, and they had ow crowned a glorious set by introduly a gool Early. This fine kind was not earlier tha grower but was seven to eight days was and the flarour exquisite. Among. recent ductious the late kinds, Newton and spus size, food for the gods, and their enormous them out colour, and exquisite flavour marked very
jointed, pointing to heavy crops and good coustitu tion. The Dryden was also one of the tinest for mid-season

## Peaches

Messrs. T. Rivers again took the lead, and their introductions had dowe much to lengthen the season in the kinds for culture under glass. The Americans had given his tine early leaches, but they were not much known yet, and cond only be valued for their precocity. An early Peach of a tirst-class tlavour was still required. Général Láe, Early C'anada, Harper's Early, from America, were not so good as Hale's Early. The Alexander, Waterloo, Amsilen June, were very early; but unless under grod conditions did not possess rich Havour, though they were juicy and pleasant, and came three weeks betore any others. A word as to failures with these sorts under glass. There was no difficulty in setting these American kints if a low temperature wer hept until the fruit was set, when the day and night heat could be raised, and they soou swelled and astouished every oue by their quickness in ripen ing, but the continuance of forcing heat during Howering was a wroug process, and caused them to cast their fruit. Outside, this did not necur, and they were valuable additions to carly fruits in this section. The best way to get them of really good Havour was to set them in an orchard house, to grow them on till within a fortnight of ripening, and theu to stand the trees ontside for the fimishing touch, when they took ou fine colvur, and became really good in flavour, though not first class. In late Peaches there wert no novelties to chronicle, but the mid-seasou kinds were well supplemented by Dymond and Goshawk, which, though not new, were yet little known, and had the benefit of a good constitution.

## Plums.

Iu Plums Messrs. T. Rivers again took first place with early sorts. Stint was a gain for an early dessert kind, and the Sawbridgeworth race of trans parent (iages received substantial amitions in the Early Transparent and Late Transpareut, and the late Golden Transparent again was fiue and very late. All these possessed the best and richest Havour for dessert. To the same firm was due the Count Atthem's Gage, one of the red-skinned sorts, of exquisite flavour, and a good bearer and grower.
In dessert Plums none had proved of so much l,enefit as Rivers' Monarch, a large black Plum, ripening at the end of September, and being a noud yrower and profuse bearer.
In IJamsons, Bradley's Kiog took the first place It was of the richest flaromr, and now that the trees lad gained age it bore aunually. It was uo equalled for private use.

## Peaks.

Deacou was a profuse bearer on Quince, but a slow grower. It did admirably on the Pear. The fruit was sweet and pleasant, but must not be left on the tree till fully ripe (August to S'eptember). Margucrite Narrillat was an immense fruit with fine colour and when eaten in condition was excellent (September to October). Messrs. Veitch's Beurré Fondueray was a fine green Pear, which would replace 1B. Bachélier. It was a free-bearer and hardy (October). Directeur Hardy was a good grower, aul ranked Al. Rivers' Conference was an clegantly shaped fruit aud a great hearer, and when not over-ripe of fine thavour and buttery. It was a good grower (October). The striped I oyenum llu Comice had yet to be provel. The Bumed din Buisson was a remarkably fine-flavoured, long lear', fuicy and delicious. It grows slowly but bears well, and was quite Al. (December to January). Le Jectier was a large Pear of uneven shape, but of tine quality, keeping till Javuary; while of older iutroductions Rivers' Magnate ani Princess maintained their characters.

Late lears are very much neglected, and in passing it might be said that Beurré de Jonghe, Ioyenvé d'Alençon, Marie Benoist, Duchesse de Bordeanx, are very fine and reliable sorts, which succeeded in the South and West as open pyramids, and in the colder parts of the country should do well on walls. Beurré Julie was a small but firstclass pear, and deserved to be better known. It was a profuse bearer and was in season in October to November. The Fondante de Thirriott was liandsome and very good, and a good grower of moderate size (December). The list of baking Pears had been extended by the introduction, through the Pear Conference, of Gilogil and Directenr Alphand,
and as the public taste grew for stewed Pears, they would be appreciated.
In Quinces new sorts were plentiful from America, but at present the results had to be waited for.

## Ranpberries any Strawberrien.

In Raspberries, Superlative Red justly held the first place. He could not speak well of Keighley Queen, lately introduced. Surpassé Fastolf from the continent was a good red. In yellow Raspberries they liad stood still, but a very large fruited one might be expected in 1896 from his firm.
Instrawberkits they had made a greatadvance, and it was to be regretted that Mr. Thomas Laxton did not remain with them to see the success of his loyal sovereign. Taking the earliest kinds, the carliest is Laxton's No. 1, a fine-Havoured variety. laxton's King of Narlies is yet one of the best for lavour. It is closely followed by Royal Sovereigu and sensation (a fine fruit but soft). George Rundle aud May Queen have not yet been so good as to warrant their adoption. Incomparable Ridewell, which gained the award of merit, is an impoved Goliath of firmer texture, and there are a few Contineutal sorts, mostly introduced by Mr. (ieorge Paul, which are useful fruits, such as Auguste Hoisselat, Edward Lefort, La France, Souvenir de Kieff, and Unser Fritz. These were not new, but are valuable in a collection. In late sorts Laxton's Latest of All (unfortunately named, as it was not a very late kind), is the best of recent sorts. Its fine size, Queen style, and splendid flavour singled it out for general cultivation. He must not overlook the new ones from Gunton Park, and Mr. Allan deserved credit for introducing Empress of India, (iunton Park, and Lord Suffield, as they were a departure in the direction of more distinct flavour, as against many recent sorts which went for size only. He woull like to give a word of caution. Many growers in trying new varieties did not give them time to show their qualities in varions seasons. Sitrawberries for all seasous must be cultivated, and he would ask growers to hesitate before condemning new or fresh varicties on trial, as it did happen that those which proved valuable in a dry were worthless in a wet season; and, as good garden
they should provide for all changes of weather.

## Grapes.

In Vines (Grapes), from time to time, really fine novelties were got, but the public taste took years before they became popular. He had however great faith in Lady Hutt, a large bunched white of graud flavour, and Diamant Traube, very five; and in Black Grapes, Appley Towers, which might be described as a late Hambro'. Grapes would soon lave to be divided into two sections-handsome sorts for the market; and choice sorts, with flavour, for one's own eatiug.

## Miscellaneols

Among outside fruits the Japan Wine-lerry deserved notice. It was a useful fruit for tarts, \&c., and as a handsome climber or trailer, its pretty, weeping habit and red stems marked out a future for it .
The American Blackberries had been a failure. It wonld, Mr. Bunyard said in conclusion, be necessary to carry out a rigid selection in order to admit of the introduction of so many new fruits.
The Cimambas said they had listenced to a most interesting laper which opened up gromnd for gond disclassion. He noticed that Mr. Bunyard did not allude to a variety of
itrawbery which surpassed the Royal Sovereign, he referrei o Laxton's Monarch

## Mr. Branard said he Lad mot Mr. Roupell remarked that

Mr. Playrord (South Austrabia) said he was a grower from the other side of the world -the celony of South Australia. (Cheers.) As colonists they had been exceedingly anmions to) get the best varieties to grow in the open. Ire sent to Mr : Bunyard, who forwarded several varieties, which, although they travelled 16,000 miles, all turned cut well. He would like to say that he thought that in growing for profit it was a great deal better to confine themaselves to the very best varicties, and only afew of them. there was one Plum he thought might be introduced into this country, the Jap anese Plum. It was very much like an ordinary Peach-a crnss between a Peach and an Apricot, There was one Plum called Red Heart, a most excellent fruit. He was astonished Mr. Bunyard did not mention the Bismarck Applo. It had been grown for some years in the Colony, and he had a specimen whioh measured 16 inches round in one direction and 16 inches in the other direction. He thought that would beat anything slown at the Palace that day. He, however, devoted himself principally to the cultivation of Cherries. The firgt Cherries he got were the Early Purple King. It was the very earliest variety and made a splendid show, as did

Eirly Lyons. He also grew Tinford Bigarreau, which, gathered before it was ripe, would not luse its flavour after it Was picked; the Black Tartarian, Kuight's Black. Waterloo, which wall keep well in extreme cold, st. Margacrite, a very latge, tirm, hack (hems, were , ther varieties that he cults atol. He lat phemed mamethan like in tons of (herrich
 W.: allougrowing a 13 a hberry that came from the Himalayas and some of these had been sent to kew Gardens.
Mr. Crump, replying to a remark nade by Mr. Rivers, who was not distinctly heard, said he had had nothing to do with the raising of the May Quasen. Ho had, however, got a model tree, and the variety was one which should bo grown y everyone.
Mr. Rolped adid he was very much struck by the remarks of the gentleman from South Australia. He, however, munt diseent from some of his opinions. He was afraid if they selected only a few Apples and a fow Pears, and so on, they would rematn stationary. If thefrefforts were confinet ans ramped entircly $h_{\text {s }}$ the mercantlo clement, theg would
 of horticulture, somach the hutter. Ho had himself a crop (ff Diamant Trambe, and he wiss glad to find that Mr. Bun yard had learnt its merits. He would not like to leave the Nanny, an excellent ciussex Apple, ont of a selection of fifty The list of first-class Apples was, however, so large, that i wis a matter of great difficulty to reduce the number to any thing like fifty; and their friend from Australia would do wisely to try all the sorts sent out to him, and not to stick to the duzen he had got. If he did not do so, he would find limself left out in the eold.
Mr. Bunyard, in replying on the discussion, said he would not advise anyone to embark on the Plums from Japan. He had got all the varieties he coulci, and he had only had tai wear fruit, offer twelve years. He womld have mentioned the Bismarck Aphe, lut lie thonght it was thoronghy well known. The same remark inplied to the American Notber Apple. With regard to the Nanny, there was on objection-it very seldom cropped.

A hearty vote of taanks was proposed by the Chairman Mr. Bunyard for his paper.
Mr. Ghant, in seconding the proposition, aaid, up till recently lie had beon associated with Roses, but for the las fire years he had gono in for fruit, and he was satisfied with the results obtwined. He did not think they need fear the ampetition of their Australian or Americau consins, who

## Second Day's Conference.

The second day's conference took place on Friday, under the presideney of ' Mr. Bunyard, when Mr. A. H. Prarson read a most interesting paper on

## Pruning Fruit Trebs,

Mr. Pearson said he approached the task of reading a paper on that subject with trepidationthe subject was one upon which so much had been said; and yet he found from experience that there was still a great deal of darkness in the mind of the average amateur on the matter, and even the great lights of horticulture differed very materially on some important points. Let them take for instauce the very first question which arose in the mind of the ordinary amateur. He purchased some fruit trees from a nurseryman, and his first question was should the trees be prumed at the time of planting : Nine authorities out of the ten would a few year: ayo have replied, No! It was not so long ago that a little band withstood a host of experts upou this very question, and he was glad to say withstood them with such obstinacy that, although the question was not settled, it was left an open one 'The advocates of uon-pruning assert that the traus planting of fruit trees being a considerable check to the trees, this result should be counteracted by leaving the branches full length for the first year so that they might produce as much foliage as possible and thus induce root-action; whilst those who advocated the proning of newly-transplanted trees took an eutirely different view of the matter, and argued that, as the act of transplanting entasied bility ome reduction of their length, the branches should also be shortened to maintain the balance; further that the long shoots being left on the tree caused a considerable amount of needless evaporation of the stored-up sap, made it much more difficult to secure the tree from being rocked about by the wind, and lastly that it defeated the end in view, inasmuch as development of leaves from the full-length shoots was so poor compared with that on the shortened shoots, that root action was retarded rather than advanced. These ideas had been gaining ground during the past few years. Of course, the results upou experimental plots, and
the results which came under the observation of every intelligent nurseryman, from the planting of trees under his own supervision, were results which were measured by the eye, and which might to some extent be read differently; but happily there was established in this country, thanks to the enter prise of His Grace the Duke of Bedford, an experi miental fruit-station, where results would be accurately recorded by men of science, so that pre judices, one way or the other, would not be allowed to hias the judgment of results.

The manner of pruning a newly planted tree must depend greatly upon the tree to be operated pipon. Broadly speaking all young, well-growu and vigorous trees should have their branches shortened one-third of their original length after planting; if the planting was done crry early in the season the pruning might with advantage be deferred for a week were left being dried up, but in the case of trees planted later in the season the pruning might be done at once. What were the objects to be attained by prining fruit trees? Firstly, to obtain fruit; and, secondly, to form trees of a nice shape and in a condition to continue fruit-bearing. With many planters, the first object seemed to be lost sight of, whilst others equally neglected the second. Pruning required a good deal of judgment, and much depended upon the kind of tree, the stock upon which it grew, and the form of tree which one desired to have as a result of one's cultivation. It was therefore impossible to lay down any hard and fast rules for pruning-each case must be taken upon its merits. There were, nevertheless, two rnles that could always be kept in view, and which formed the basis of nearly all pruning: first, that all branches must be so disposed as to admit the sunlight and air into the middle of the tree-for, without this, fertility was inpossible; and, second, that all leading shoots should be as strong as possible, in order that a free flow of sap be maintained, and the side shoots should be as weak as possible in order to favour the formation of fruit spurs. A good axiom would be-the more a branch is shortened by pruning, the stronger will be the growth reaulting from the remaining buds. After all, one's judgment was quite as useful in pruning as the knife. To begin with a few examples, let them suppose that they had purchased some standard trees of Apple, Pears or Plums which had been well grown. If the trees were young, say three or four years old, the shoots should be cut back to one-third of their length, taking care to prune to an outside bud, so as to produce a tree with an open head. The reason for this was that the first care, with standard trees, must be for a few years to secure good growth and form firm open heals which would carry fruit for generations-and those who sought to obtain fruit at once made a fatal error. If young standard trees were left unpruned they would make scarcely any growth the following season, but the bads would just push out a few leaves and remaining nearly dormant, would, the following year, be transformed into hloom buds, and if these produced fruit the long brauches would be broken down and the tree ruined for life: if, on the other hand, one wished to prune them back the first year after planting, a whole season would be lost, and it was often very difticult to find buds to prune to, as the buds on the lower portion of these long branches would have failed to develop, and were what were technically called "blind.
Pyramid treen should be treated much in the same way an standards; young vigorous trees ahould be clasely pruned; older trees, being more formed, did not require such severe pruning, as the foundation of the tree was already laid, and what one wanted was rather to continue the work already begun, than to cut hard back and so form strong shoots; older transplanted trees merely required the longest shoots shortening, in order to maintain the balance of the tree, and to prevent their lower portions having undeveloped buds. It was frequently advisable to thin out entirely a few of the branches upon formed or specimen trees, where they were placed too closely together, as this was an operation which seldom received atteution. These remarks npon pyramid trees were of course based on the mupposition that they had been carefully pruned of pyramid trees being purchased and planted which had stems three purchased and planted able. Such trees could remark were not applic. able. Such trees could only be treated by being cut hard back to 15 or 18 inches from the anface of the
was possessed of sufficient patience to await the wesult, the alternative being to dig them up and burn them.

Cordon Trees. - These should have the leading branch left as long as possible, the only object of shortening it at all, if well ripened, being to ensure the whole of the buds breaking. Now as they wanted the buds to form ruit spurs, that they should be as weak as possible, and away, the stronger would the growth be from the remain. ing buds, let them err rather on the side of cutting away too little than too much.

Empalier Trained Trees. - These should have the leading shoot pruned back to about 14 inches from the top pair of branches ; provided, of course, proper buds could be found there to make growth to form was, be it an inch or so higher or lower. The side branches which were about 1 foot apart, should be treated just in the same way as cordons. He wished to make it clear that the pruning of a cordon or espalier tree should be the exact opposite of that recommended for a standard tree, for the simple reason that in the case of a standard tree, the result which one wished to obtain was growth, whilst for the already formed trained tree one wanted short fruit-spurs.

Semmer Pruininu. - This, as ordinarily carried out, was the main cause of our garden fruit-trees being unfruitful ; whereas, if properly done, it should cordons and side-shoots from the branches of espalier or other trained trees, or pyramids, should be gone over during the season of early growth (May), and pinched back with the finger and thumb-nail to three leaves. These shoots would then commence to grow again from the upper buds, and should be pinched back to two leaves (making five). Some times a third pinching was necessary in a wet autuma. The result of this treatment would be that the side-shoots would be thin and weak, and so predisposed to form fruit-spurs, whilst the leading shoots and those required for extension would have had an extra amount of sap thrown into them, and would consequently be strong, clean, and vigorous. In the subsequient autumu or winter pruning of these side-shoots leave always on young and vigor ous trees three buds; on old trees, two would sutfice. The reason for leaving three burls was, that one or two--generally two-must make growth, whilst they wanted the lowest one to remain nearly dormant, and just put out a leaf or two, so as to develop into a fruit-bud next year. The mode of summer pruning often seen practised was very different to that here described. It consisted iu allowing the side-shoots to grow freely until July, and then cutting them hard back to two buds. The result was, that the shoots were far thicker and stronger than they should be, and consequently more liable to make strong wood next season. The tree received a great check from the removal of so much foliage, and tinally, the buds left were almost certain to break ont into growth the same season. Close pruning like this quickly transformed a tree iuto a dense thicket of shoots impervious to sun or air, and totally unfitted for bearing fruit. Close pruning was responsible for more failures in garden fruit culture than all other causes put to gether, and he blamed the methol of close summer pruaing, because the trees were thus subjected to two close prunings a year instead of one, and thus hecame thickets in about half the time. The reduction of apurs, necessary as it was, must be deferred until the bloom-buds are formed. As soon as one had a really developed bloom-bud on the spur, any growth extending beyond it might and should be removed, so as to give the tree a neat appearance, prevent the overcrowding of follage, and have the fruit as close to the main feeding supply as possible.
Stone Fruits. - He would like to say that all stone fruits hated the knife, and the more pinching one could do to save subsequent pruning the better would the tree like it, and the less would they be troubled by gumming and other evils.
Root-Pruning. - In the present condition of knowledge - and many things had to be learned-he looked upon root-pruning more in the light of a surgical operation to be undertaken advisedly than as one of the routine operations of the fruit garden. Care should be exercised, or the cure was apt to be worse than the disease. In the case of young trees there was of course no difficulty in the matter; but with old trees, when the roots had extended to a considerable distance, there was a great danger of killing the tree. Tbe modus opercudi of root. pruning was this: as early as possible in the season,
as soon as the leaves turned yellow, and before they fell off, get out a trench round the tree to be ope rated upon, cut back the strong roots (with an upward cut of the knife) and drive a spade under the ball of soil in which the tree stood, so as to sever any tap-roots which might be working down: into the subsoil, fill up the trench again as quick $l_{y}$ as possible with some good loam and old manure from a spent hotbed, and the shortened roots would make plenty of young fibres before the advent of winter. When really old trees had to be dealt with, it was best to prune only half way ronnd the tree one season, and to complete the circle next

Mr. Pearson, whose paper was listened to with deep interest, explained many of the points by means of specime

Mr. Arnold said he had paid a deal of attention to the paper, particularly with regard to the pruning of contions. go round the trees, say in June. Instead of cutting amans the lateral growtha, he bruke them and left them banging, and he found that when they wanted to cut back finally to tho third bud, it answered to break the branch at the fourth wed as they would find that the first bud beyond the break would develop into an unmistakeable fruit bud.
Mr. Colvile Browne (Hextable) said he should like to corroborate the remarks of the last speaker. As one who had a good deal to do with fruit-pruning, he found the quite sure whether it would answer in large establishments by breaking off the breast shoots and the superfuons shoots. It was noticeable that below the break or below It was very curions, and he get an unmistakeable fruit bud to bear it in mind with respect to rank growers like the Pitmaston Duchess. If they had some good system of bending or twisting with rapid growers, they would obtain rery mach better results in the long run and have less work for the knife. He found there was more harm done by the pruning knife than from any other cause. Magnificent trees were sent out from the nurseries and spoilt in four or five years. He thought, however, nurserymen were grestly to blame, because thes did not give all the information they ought to. They had to thauk Mr. Pears much valuable information that das
Mr. Fletcher (gardener to Mr. Tbompson of Maidenhead)
testimony to the value of the paper, and waid those who ight and guidance. He was very pleased to hear $\mathbf{y}$. Pe.zrson speak abour newly-planted trees, and he thought it might be taken for granted that as a mule newly-planted trees should be pruned. He knew there had been a con. roversy on the subject, but he was not certain which side won. They should be guided by common sense a greas dealh and by circumstances.

## individual judgment.

Mr. Rivers said he could fully bear out uh it had been said about twisting the branches. Constant piuching was nots success, and with cordon trees one pinching was enous it and it shonld be done in June. He was once in a garden Rouen, belonging to a professor. The trees were beautifuly arranged, but there was hardly a fruit $n$ theni asked the gardener whether tbere whs any frut in foot orchard, and the gardener said there was. They had not they any fruit on the cordons because, added the gardener, Whith were pruned on the professor's syatem (laughter. neco regard to root pr
A gentleman asked whetber it might not be worth while get over the difficulty by preparing the trees before thans planting, in the same way as they ought to do with Raw erry canes.
Mr. Bomyard anill he would strongly advine that pruning bould not be done the firat year. As to pruning trees bolore they were sent out from the mursery, speaking as one glad had to do a vast amount of packing, he would be very to do the pruning, as nurserymen were but mortad for 3 tradesmen. But people would not like to pay to nmill for well-pruned tree, because thes would think it too that these the money. It should, howevar, be remembere they wio trees were entrusted to rallway companies. handled by inexperienced persons, and sometimes unad and serionsly. If the trees were sent out properly p fato prop Were then
Mr. Pearson said he hoped he had made it quite clear thas lose pruning was the thing he was fighting aggingt. Roply ing to questions, he said that at present we had stock for Plums. With regard to the betheir old friond branches, one method was that adopted by their to the end Shirley Hibberd, who used to tie bricks and stalogue, his or of them. As to giving information in a catalogu erience was that the reader would talse no What wan aald, as he would be aure nurseryman had his own axe to grind.
pyrauids, there are a number of them whit and there are a number thanches. Cherries did not like the knife. As regards standerd trees-Applen, Pum and Plums-he believed most strongly in pruning thom the time of planting.
(To be continued.)

## ONIONS AT BANBURY.

Stptbmer 19.-The annal Onion Show, eatabliahed by the late Mr. Henry Deverill a few yeara ago, took place as usual in the Seed Establishment, Cornhill, Banbary, on the above date, the whole of the shop and one of the warehouses being filled with exhibits. Despite what many regard as an untoward seanon, Onions have tnished in fine condition, as was evidenced by the oplendid asmples exhibited on thi occasion, there being a very keen competition in everal of the classea.
The Champion prize for the six largett and handeoment specimens of any one of Deverill's Pedigree Onions, was won specmens any one of Deverill's Pedigree Onions, was won Bssingatoke, who had sir of Allas Craigo weighiog $17 \frac{1}{f} \mathrm{~b}$., all very finely finiehed, hadiome, plump, and wolid. The largost of the six weighed 3 lb .1 oz , and when lifted from the open Rround, $3 \mathrm{lb}, 6 \mathrm{oz}$.
The next class was for twelve specimens of either one of the following varieties-Aile Craig. Adranoer, Coooe Nut, and the origianl Excelsior. There were several computitora, and all four prizes went to Ailsa Craig, which is the largest Union in caltivation: Mr. Bowerman again taking the lst prize with twelve, weighing $30 \$ \mathrm{lb}$ 。; Mr. Nicholls, the Gardens, Nuneham Park, Ogford, winning 2nd, with 26 it lb .; Mens. No
 Kymlese, the Gardens, Malshanger Park, Baeingstoke, 3 rd,
with $23 \ddagger$ lb. With twelve specimens of the flat type, viz. with 234 lb . With twelve specimens of the flat type, viz.,
Rousham Park Hero, Anglo Spanisb, The Lord Keeper, or Royal Rousham Park Hero, Anglo Spanisb, The Lord Keeper, or Royal
Jubiloe, Mr. W. Kmecler came in lst with twelve very finelyJubiloo, Mr. N. KMELLer came in lst with twolve very finely-
finished examplos of Anglo-Spanish, weighing 21 l lb.; Mr. R. Linisbed examplos of Anglo-Spanish, weigbing 21, 1b, MM. R. 2nd ; and MP. C. J. WAITE, the Gardens, Glenhuret, Esher, the 3rd, both showing Anglo-Spanieh, in each case the dozen bulbs weighed $19 \mathrm{lb} .$, Mr. LyE's wore better finished.
With twalve examples of the Improved Wroxton, said to be one of the best keeping Onions in cultivation, Mr. R. LyF came 1st with 12 lb . weight, all true to type: Mr. Haines, The Gardens, Coleahill, Shrivenham, was 2nd, with 11 lb .
In the clase for twenty Onions of any variety, offered by Hemry Deverill, Mr. Knellers. Baingutoke, was 1 st with Ailsa Craig. woighing 33 lb .; and two other prizes were warded to this variety.
The next clam was for $t$ welve Onions of any variety, grown in Sootland and the Northern Counties; Mr. C. J. Fisier, York, came let with eapital bulbs of Royal Jubilee: Mr Milleen, Stockton-on-Tees, 2ad, with Anglo-Spanish; and Mr. G. Coles, Lancaster 3rd, with Royal Jubilee.

Valuable prizes were also offered for eight dishes of vegetables in the main varieties distributed by Mro Hemey Devicause; the let whe won by Mr. R. Lere with a supert colloction; Mr. C. J. Waite being a close 2nd. There was alto an excellent competition in the clases for eight diebles of vegetables, shown by cottagers and ellotment holdere, and a vegetaber of capital collections mere staged.
This exhibition is cery were staged.
This exhibition is rery popular in Banbury, the town haring long been famous for its Onions; and free admiesion is permitted to anyone desirous of witnessing it

## GRAND YORKSHIRE GALA

Septimber 24.-A meeting of the guarantore and life members in connection with the Grand Yorkthire Gala was held on the above date, at "Harker's Hote)." Alderman Sir Joseph Terry, J.P. presided. The b slance sheet sabmittod showed a profit of $21137 \mathrm{7s}$ ad. on the year, compared with $£ 3483 \mathrm{~s}$. 4 d., on the gala of 189. It wis recommendell that grants amounting to R300 shon'd be made. and they were apportioned as follows:- County Hospital, ${ }^{250}$; Dispensery, 230 ; Blue and Grey Coat Schooln, 840: Boys' Industrial school, e10; Girls' Industrial School, s10; Bootham Asylum, Na1; Home for Friendiess Girle, \&10: Home for Nurses, \&15: Blind School, 2558, . Soldiers untitute, 25: Penitentiary, E10; Yorkhire Society's Echool, 2.6 bs .; St. 8tephen's Orphanage, 210 ; Charity Organisation, E10; Association for the Care of Young Girle, $810 ;$ Hungate Misoion, $\mathbf{e s}^{5}$; Bisters of gt. Vincent de Paul (Crèche), R.5. Gratuities. \&7 los. It was decided to invest 2103 of the ezar at present in the bank, and suggestion was made that the remainder, or a part of it, might be devoted to the improveremainder, or a part
ment of the fisture?

## Obituaty.

Peter Grieve.-By the audden death of Mr. Puter Grieve on the early morning of September 26, 1895, the borough of Bary St. Ejmanda has loat a arefal citizen, and horticalturiste a warm-hearted comrade and a distinguished practitioner. Though afforing for mome years from heart divease, the deceased, with his nual pluck and perseverance, has atcended to his customary daties as a member of the Barial Buard, a regular attendant at the readingroom, \&c. One of his last act was the sending of a tentimonial to Mr. Barron, the receipt for which was his first letter received after his death this morniog. Knowing him ao well as I have done for nearly fifty years, I believe be would bardly have had this other-
wise. Mr. Grieve was 83 , and will be baried with his only daughter, Lucy Grieve (ber Pear iu fraiting well this year, close to her dead father in Bary), at Culford, close to his life-work. Mrs. Grieve, who is well known and gratefully remembered by 20 many gardeners for her hospitality, survives her husband, and will have the warm sympathy of many reader of this notice. The funeral took place in the churchyard at Calford on Tuenday, October 1.

I should like to any emething-much, in fact-of the worth and worl of my friend of nearly filty years; but his loss is too recent, and too great. Located near him, asnociated with him in every ponsible way in horticultaral mattor for so long a period, his audden removal leaves a vacant place which is hardly likely to be filled. I loved him at a friend, a companion, a neighbour; a brother of the pen, the knife, and apade; and never found him wanting in any good work, or kind word or deed. As to hil great doinge as a caltivator in all depart-mente-are they not to be read in all the back records of Culford Gardens for years, and in many a back number of the Gardeners' Ckronicle? His solid soundoem at a juror; his practical experience as a

writer, are also well known. Hi work among double Petanias and Pelargoniams was also duly chronicled as it appeared; and the art of raising Tricolora by the father of most or all of them, may, I believe, atill bs had.

Neither has the change of fashion in furnishing flower-beds detracted from the value of Mr. Grieve' work in hybridisation or crove - breeding Polargoniams or other plants; his akill and perweverance were marvellous, and so were the products; the tricolors, bicolore, and brogzes had a brillisat reign for jeara; and it is quite ponsible that for various purposes they may have a renaisanc. Be that as it may, Mr. Grieve did good work at Culford and other places as a landacape gardener, as well at a oultivator and crom-breeder. The grand Yew hedges inclosing the vegetable quarters in the princely kitchen gardens are of his planting, and will prove, perhaps, his most enduring monument Hi flower-garden within the centre of the kitchengarden, and in other directions; his raised bede of beanty on the vine-borders, were for yeart pictares of exquisite colouring and finiahing. And now he rest under the shadow of the old fame and the old
beauty; and may hir reat and his rising be alike blessed is the heart-felt wish of all his comrades who knew him best, and loved him mont! D. T. Fish.
[Oar portrait is of Mr. Grieve in middle li'e, and originally appeared in our columns on August 28 1875, in illuatration of a detailed account of his career. Mr. Grieve was one of our most valued correspondents, and we highly appreciated his jadgment when, some years aince, we had occaaion to seek his advice. Bat it is as a hybridist that he will in the future be known. Those who knew him beat will be called in their turn, bat Grieve's work in advancing horticulture will remnin a valued heritage to posterity.]

Charles V. Riley.-It is with great concorn that we extract the following paragraph relating to thie diatinguished entomologist from the colamne of Garden and Forest, no other communication having up to the present reached us. Chables V. Riley, the well-known entomologiat, died in Washington on Saturday night from injariea received in a fall from a bicycle. He was born in London in 1843, came to this country at the age of seventeen years, and settled on a farm in Illinois. He served as a coldier in the last years of the war, and after come experience in journalism, he was made State Entomologiat of Mistouri, which position be filled for nearly ten years. His work in that State attracted mach attention, avd in 1878 he came to Waahington, where, until last year, when he reaigned his position, he bes practically supervised all the entomological work carried on by the Government. Mr. Riley was a tirelest worker, with an aptitude for original research, and many of his published papert are of permanent value. He had a talent, too, for political management, and for many years he war recognised in the Department of Agriculture as one of the fosces in directing it policy and selecting its agents.

## Plant Notes.

## CONVOLVULUS MACROSTEGIUS.

I meceived aeede of the above-named plant from California at the commencement of this year, and was informed by the sonder that, like the Solanum ranti, it was indigenous to the Itland of Santa Croz, and that it had yellow flowers, and was now in all probability sent to Earope for the firat time. I distributed seeds to several friends, and nowed some myself, of which four germinated, and were in May planted out in my garden, where they have growa mont vigorously, ending out long trailing thoots from 2 to 3 feet in length, but have not bloomed. I fear the winter frosts will kill it even here, and should be glad of some information aboat it. W, E. Gumbleton.

Solanum xanti vab. Walrachi.
At the commencement of this sear I received from the Director of the South Californian Acclimatieation Society at Montecito, Santa Barbala, some seed of what he assured me was a most beariful new Solanam, under the above name, and which came from the Island of Santa Croz, and was now nent to Earope for the first time. He said that the flowers of this plant were of a beautiful shade of trae blue, and eweat-acented, wo that I thought I had got a treanure indeed. Nearly a dozen of the seeds came up, and keeping five for myself, I dietributed the othert amonget my friends, who are interasted in new plants. I planted my five planta in a bed in my garden in the month of May, where they grew and developed very rapidly, sending up first aningle stem to $a$ height of between 3 and 4 feet, and then branching freely from the axil of nearly every leaf all up the atem. About the middle of Jaly buachee of buds appeared on the points of all the topmost shoots, which opened towards the end of the montb, when, to my great diaspointment, the colour of the flowera tarned out to be not at all true blue, as they had beer described to me by the sender of the meeds, but of a parplish-lilac, with five little green and
white spots or marka round the centre of the flower one at the base of each petal．I could not perceive any trace of perfume，which was another dinappoint ment to me．I sent apecimens to the herbarinm at Kew for identification，which were pronounced to be merely the type form，S．xanti，Can it be that S．zanti var．Wallacei was a blue bybrid form，and that the meedling have reverted to one of the parents？I think this matt be the case．W．E Gumbleton．

The term＂acenmulated temperatare＂indicatee the aggre gate amount，as well as the duration，of degrees of named：and this combined result is expresesed in Day degrees－a＂Day－degree＂signifying $1^{\circ}$ continued for an inversely proportional number of hours．

## THEPAST WEEK

Tiz following summary record of the weather throughout the British Lalands for the weet ending September 28，is formiahed from the Meteorological Office：－
＂The weather during this period was extremely fine，dry， and aummer－like generally．Thunder and lightning wer experienced，however，over Ireland on September 23，and over the more sonthere parts of Ingland on September 24 or 25 ， but the storms were accompaniod in moot casso by very little rail．

The temperature was unusually high for the time of year the excess above the mean being as much at $16^{\circ}$ over the greater part of Rngland，and between $7^{\circ}$ and $9^{\circ}$ eleewhere In the majority of districts，this week has been warmer than any experienced during the past summer．The height of the maxima were registered on September 24 at most of the English stations，but towards the end of the period in the rish and scotch districts．They were as high $9886^{\circ}$ in th Midland Counties＇and＇England， ， $85^{\circ}$ in the＇Ohen Islands．＇ $81^{\circ}$ in＇England，E．and $\mathrm{S} . \mathrm{W}$ ，＇and $82^{\circ}$ in＇England， NE，＇while over Ireland and Scotland the bighest readings E E，＇while over Ireland and Scotland the bighest readings
raged between $75^{\circ}$ and $79^{\circ}$ ．The lowest of the minima were raaged between $75^{\circ}$ and $79^{\circ}$ ．The lowest of the minima were

recorded either on September 22 or 23 ，when the thermometer | record to $32^{\circ}$ in the＇Midland Counties，＇ $34^{\circ}$ in＇Englavd，E．＇and |

## SEEDS．

London：October 2．－Meesrs．John Shaw a Sons，Soed Merchants，of Great Maze Pond，Borough，London，S．E． describe to－day＇s market as bare alike of business and of buyers．Juat now，consumptive sowing－wants are at minimum，whilst no speculation whatever has yet sprung up． All kinds of Clover and Grass－seeds are consequently cheap and neglected．There is no change in either Rye or Tares Canary－seed having for the past month exhibited remarkable stendiness，now shows decided signs of making a jump up－ wards．For Peas and Haricots，the inquiry is slow．Mnstard sud trapereed show no alteration．

Braci and White Grapes: $H$. G. $B_{0}$. The berrien are affected with the socalled "spot," sungus called G'æaporium lwsicolor ; there in no known care for it, although the free use of sulphar, which is a abstance inimical to all forms of fuagus life, might ward off fature attacks. It ahould bo spplied mixed with white-wash as a dressing for the hot-water pipen, and for filling evaporatiog pans placed about the vinery. Remove as zoon as seen all the affected berries, burning them forthwith.
Clmbodendrons: R. M. Keep them moderately dry daring the winter.
Ccelogng cristata: $R$. M. When growing, the temperatare of the cool part of the Cattleya-house saits it well, but during the winter it ahould be kept in a cooler house, removing to a warm house before growth begin. It will flower from I acember to March, and if it be not expesed to damp, or the flowers are aprinkled with water, the latter will individaally last in good condition for a long time. Aa antumn approache the quantity of water afforded at the root ahould be gradually redaced, till in the winter just enough is applied ae will keep the paeudo-balbs plamp. In the summer, a alight shade may be allowed on the house when the aun is hottent, at other times full exponure is best for the plant.
Flowrer pots for Plants of Coleus to be Wintreed IN: $\boldsymbol{R}$. M. Half-a-dozen cuttinge would be a nofficient namber for a large 48, i.e., a 5 inch pot.
Fumiators: K. L. G. We ure unable to inform you which is the beat apparatue.
Graprs: A. L. The berries came to hand in a decayed coadition owing to the great beat and bad packing, and no caterpillars were found in the box. Piease send the caterpillar carefully packed in a tin box, when we will endeavour to give jou ite name.
Insect Destroyne Saxtfrage: E. L. B. Probably a grub of some species of weevil. The beetle (weevils) themelven can be caught when feeding at night, but in the case of the grabs it is a difficult matter. You should take up the Saxifrage plante, searching carefully for the grabs, and then replant into fresh soil in another part of the garden.
Insects: A. Parry. The Pear treen were attacked by aswly larvæ. Carefally hand-pick, and deatroy them; or place a beet, or something similar ander the treep, and strike the lower part of the trunke sharply with a mallet, gathering up the larve that fall. If the trees are tall, aprsy with kerotene emalnion, R.McL.
Names of Fruits: Hartwell. Pear Hesale; Apples, 1. Dachess of Oldenburgh; 2, Cox's Orange. A Reader. 1, Hollandbury; 2, Golden Noble; 4, Hawthornden; 5, Brownlee's Rassett; 6, Early Jalian.-C. R. 1. Nerine $O^{\prime}$ Brienii carmioata. J. M. 1, Cratwañ coccinea; 2, Sambucas canadensie. - $G$. $\bar{K}$. Amaryllis Belladonna. G. H. Gaaphalinm uliginonum.

Petunia: W. A. G. Not uncommon.
Pyros Maulet: E. W. The fruits make a preserve, ratber acid, but very agreeable to the taste. Pare the fruite thinly, and remove the seeds. Boil the fruit gently until it is quite soft, then pass it through a sieve, weigh it, and add half the weight of the best loaf-sugar (cruahed) to the palp, and boil the mixture until it "jellies" as it cools. Pat it away in glane jars, carefully tied down.
Skmdling Baldwin Apple: J. D. Without reeing the plant we are not enabled to form an opinion concerning the pruning that may be necensary. We should opine, having regard to the warmth of the autumn, that a scoall amount of shoot-thinning only will be all the pruning required. It is not good practice to crop young trees heavily, at it tends to check growth too much.
Stoni Floor that Gets Greren: R.M. Use Weedkiller, which is to be bought of the florists and nurserymen. It is a poison, and you mat therefore be careful in its use, and not allow children, domentic animals, fowle, \&c., to go into the room till the ubatance has done its work. It mas be mopped all over the next day, and the dirty water poured into an underground drain. Scrub the floor with a bast broom and hot soap-suds.
Thanatophore: $\boldsymbol{R}$. T. We believe it to be an efficient merns of killing insects infesting planta grown ander glany, without injury to the latter.
Walnuts: H. G. B. There is no difficalty in removing the outer covering of the nute, if you allow them to remain ungathered till quite mature. Do not store them in heap before removing the hasks, bat do it without delay.
Williame' Bon Chbétibn Prar: W. E. No You have let the fruite remain on the tree too long, with the result that they have become "sleepy." This variety should be taken from the tree as soon as the stall parts readily from the atem, going over the tree each alternate day till the crop is gathered. After gathering any of the fruits, place them ia a cool dry place till they begin to change colour. It is at this atage that they are the bent eating, a perfectly yellow Bon Chzétien being nearly always over-ripe. In the South, except in cold clayey soils, this variety should not be grown on south walla, the fraite generally becoming mealy or else rapidly over-ripe. The flavour of the fruit is more racy from tree growing in the open quarters.

CONTINUED INCREASI in the CIRCULATTON OF THE "GARDENERS" CHRONICLE:"
TwPORTAMT: To ADVERTLEERS. The Publither has the sabisfroction of annownetng that the etrculation of the "Gardeners" Chronicie" has, since the reduction the the price of the paper. Increased to the extent of more than 80 per cont., and that it continues to increase weolily.
Advertiors are reminded that the "Chroniole" circulates among COUNTRY GEMTLEEEE, AYD ALL CLABSES OF GARDEMEBS 1UD OABDMar-LOVERs at home, that thas a speciaily large POAEGE AWD COLOHLAL ONBOULATSO, and that it in preserved for refremer in ail ole primotpal Libraries.

These are the first and only plants from these mountains, and are from quite a different part of Colombia to those sold by ns on October 4.

\title{
REMARKABLE PLANTS \\ CATTLEYA, PROBABLY GIGAS OR AUREA SECTION (MONTANA TYPE). \\ All Seedling Plants, and mostly all unflowered. A much diversified and most remarkable lot of plants.
}

CATTLEYA CIGAS, IMPERIALIS TYPE.
THE GREAT CRIMSON AND PURPLE GIGAS 275 LOTE.

\section*{Aiso, 187 LOTS of a form or \\ SANDERIANA,}

From a Native Collector, from the far interior. These are of a wonderfully distinct-looking and promising oharacter-bulbs are long (as in Lælia), olub-shaped, with thick, short, broad leaves. The plants are simply grand. This magnificent type of Cattleys gigas, together with C.aurea, will be as prolifio in quite new forms as our celebrated Montana varieties of -

\section*{CYPRIPEDIUM INSIGNE.}

Our Collectors are exploring vast distriots, at great expense, to secure all the forms of these magnificent Cattleyas, which we shall hope to offer to Orohidists without any reserve. We must sell them, if only to continue the great work of collecting we have undertaken in these new pathleas wilds, and hitherto impenetrable monntains. Every importation will be offered as it comes to hand.

This is the best time of year to buy this type of Cattleya; this voe guarantee, the plants are perfectly dormant, and could not be in finer or more perfect condition for growing.

\section*{\({ }^{\text {arso, }}\) \\ A NEW GUINEA DENDROBE, \\ With large white flowers, as large as D . bigibbum, with bulbs in the way of D . atro-violaceam.} Collector describes it as a GRAND NEW DENDROBE.

Together with other fine Orohids, including TWENTY BOXES OF MIXED ORCBIDS.
FOR ALL PARTICULARS OF SALE, SEE CATALOGUE.

\section*{THE "SPOT" DISEASE OF ORCHIDS.}

TTHE disease known as " spot," whioh appears under the form of brown apots or blotohes on the living leaves of Orchids, is unfortanately too familiar to cultivators and admirers of these plants, and although the health of the plant is not materially affected, exoept when the spots are unusually numerous, nevertheless the unsightly blotohes on the leaves detract greatly from a fall appreciation of the beanty of Orchids when in bloom.

The disease first appears under the form of minute pale spots, one to two millimètres in diameter, on the upper surface of the leaf, which vary considerably in number and arrangement, being in some instances numerous and orowded, in others, few in number, and scattered. Every portion of the leaf is equally susoeptible to the disease, and the fact that very young leaves of diseased plants frequently show "spot," has been considered by some as strong evidence in favour of the disease being due to some parasitio organism; this, however, is not the true explanation, the disease proving oonclasively to be of a non-parasitio nature, and with proper precautions to be entirely under the control of the cultivator. My previous note" announcing that "spot" was due to the presenoe of an organism called Planmodiophora orohidis, was based upon the absolute agreement with the microscopio details of two diseases of Vine-leaves desoribed by Viala and Sauvageau, \(\dagger\) and attributed to the presence of two organisms aalled Plasmodiophors vitis and Plasmodiophora oslifornics respeotively. Returning to the Orohid disease: the minute pale spots already alluded to, whioh, it may be remarked, are not at all conspiouous, and are likels to escape observation unless specially looked for, soon assume a pale brown colour, and gradually increase in size, retaining an irregularlycircular outline, until they attain a diametor varying from four to eight millimetres. When the spots are numercus and near together, they frequently run into each other, forming irregular blotohes of variable size and form. As the disease progresses, the spots beoome darker in colour, and owing to the collapse of diseased cells beneath the epidermis, the surface of the apot beoomes depressed below the level of the surface of the leaf. In many instances, the diwease passes oompletely through the leaf, forming a corresponding brown depressed spot on the under surface.

}

Microscopic examination shows the following details. The first indication of disorganisation is platmolytia, followed by the complete disappearance of the chloroplats from the palinede-cells of the leaf, hence the pale coloar of the spote daring the firat atage of the diseare. This is immediately followed by the appearance of a highly refringent, hyaline, oleaginout-looking aphere in each cell. Daring the early period of formation, the centre of the aphere present a granalar appearance, and when broken up and treated with a aolation of iodine, the granales prove to be minute atarch graina, which were liberated from the divintegrated chlorophyll grains, and engalphed daring the formation of the aphere. Within three daya from the first appearance of the pherea, the enclosed atarch grains have become completely dissolved, and their substance added to the common mass. If at thic atagea section through a diseased apot be piaced in water and examined nuder the microscope, the apheres will be seen to undergo vacuolation, gradually changing from the previous solid condition into hollow vesicles, the walls of which become irregularly perforated or reticulated, the configaration of the network alowly and constantly changing after the fashion of the movements presented by the vegetative phase of Planmodiophora Brassicæ, but differing in the movements, being of a parely phyaical natare, the perfectly homogeneons membrane becoming thinner in proportion as the vesicle increases in size, and in conatantly retaining a rounded, even contour. Increase of size usually continues until the vesicle fills the cell in which it is contained. Vacaolation takes place exactly at atated above when sections are placed in a 1 per cent, solution of osmic acid inatead of water, which, taken alone, in sufficient proof that the epheres in question are not of an amoeboid natare. In some instances, instead of one, several apheres are formed in a cell, esch undergoing racaolation, bat remaining comparatively amall in size.
The composition of the epheres is proved by the action of reagents to be complex, and although I bave sometimes spoken of them as tannin-venicles, it must be clearly anderatood that I do not intend to convey the idea that they conaite entirely of tannin, although agreeing in many reapect with the atructures called tannin-vesiclen by Klercker,*
That tannin is present is shown by the following reactions: Potassium bichromate produces a brightbrown precipitate, insoluble in water; an aqueous solution of cupric acetate causea a dingy-brown colour, which changen to green when subsequently treated with an aqueous solation of ferrous euphate; a 1 per cent. solation of osmic acid blackens the apheres, but as previoasly stated, does not prevent vacuolation. Finally, the accumalation of methyleneblue by tannin-bearing cells, as pointed out by Pfeffer, + held good, the vesicles becoming stained deep blue after remaining in an exceedingly dilate aqueous solution of methylene-blue for twenty-foar houre ; iodine-green may be abbetitated for methyleneblue with good resalts. All the above reactions are mont decided before vacuolation takes place; in fact, when the venicles are fally distended, bat little coloration is produced by any of the reagents mentioned. Oa the other hand, the presence of proteid in the apheres is saggented by the rapid staining of the mass, on the application of auch reagent as eosin, carmine, iodine, \&c. Carbobydrates are also in all probability present.
The apheres originate in the cell-sap, and their presence depends entirely on plamolysis of the cells, which occurs during the earliest phase of the disease. Contemporaneously with the formation of the tannin-venicles the cytoplanm becomes turbid, the primordial atricle at the ame time becoming tinged brown, and undergoing important changes. In nome cases, the inner surface of the latter becomen aniformly covered with minate, apherical masees, and in this condition rewembles, soparficially, celle tllled with the spores of a Planmodiophora; here, how-
* Studien thber die Gerbitottrikuolen. Thblager Inangur imeert. 1888.

over, the resemblance ende, as the minute apheren are found to form only a single layer lining the primordial utricle, and not completely filling the cell, as in Plasmodiophora; furthermore, reagents show that the spheres consiat of tannin, and not protoplasm. In other cases, the inside of the epiplasm, and sometimes also the cell-wall-which, along with the other parte, undergoes disintegration -is covered with tabes or varionsly branched, very slender rode of a brown colour. Usally, however, the epiplam or primordial ntricle become entirely disorganised, drops of tannin accumalate at various pointainits abstance, accompanied in many indtancea by minate crystal-like bodies. These eventaally disappear, leaving holes in the membraue, which, along with others previously present, prodace an irregular reticulation, the whole being of a brown colour. The nucleur of the cell frequently remains anchanged throughout the entire çcle of disease.

In Viala and Saragasa' account of the Vine disease previously alluded to, vacuolated tanninveacle and the reticulated primordial utricle have been reapectively interpreted at constituting the vegetative phase of their apposed Plasmodiophora vitin.

The investigation of the disease under contideration was at first puraued along lines suggested by the preconceived idea that a fungus was the cause of the mischief, and it was only after numerous and varied experiment. had failed to demonatrate the existence of the hypothetical fangus, that a search was made for bacteria, tat with a like result. Finally, failing to induce the disease in bealthy plants by inocalation with the expressed jaice from diseased pots, even when introduced under the epidermis, thas proving the absence of an enzyme or organic ferment, which would have been due to the presence of fungi or bacteria, this was accepted as corroborative evidence of the sbuence of these organimm.

At this atage, Mr. W. Watson, assistent curator, Royal Gardens, Kew, whom I take this opportunity of thanking for numerous practical hint during this investigation, aggested a wadden chilling of the plante as a probable cause of the divease. Actiog on thin suggention, the following somewhat drastic experiment was undertaken.
A young healthy plant of Habenaria Susannx, R. Br., perfectly free from " wpot," and which, up to the date of the experiment, had been growing in a house having a temperature ranging between \(75^{\circ}\) and \(80^{\circ}\) Fabr, wat elected for experiment. Minute particles of ice were placed at intervals on the unipjared epidermis of the upper aurface of the leaver, the plant-along with the pot in which it grew-was then placed in a sink and covered with a bell-jar, and cold water from a tap allowed to flow over the bell-jar for twelve hours, during which time the temperatare inside the jar ranged between \(41^{\circ}\) and \(45^{\circ}\) Fahr. Twenty-four hours after the ex. periment, the points on the aurface of the lesven originally covered by particlen of ice were pale in colour, and on examination under the microscope, plamolyair of the cells of the palisade-tisaue, and degeneration of the chloroplasts, were found to have taken place. The remaining apote were examined at intervaly, and within four days, every phase of the disease was obwerved, agreeing in every respect with the feature already described.

The foregoing experiment showed that a nudden fall of \(30^{\circ}\) of temperatare could not induce "pot" on the dry arface of the leaf, but only at those point where it had been mointened by the melted ice. That the chill caused by contact with the ice itself was not neceasary for the formation of "spot," was proved by a second experiment with the name apecies of plant, all the conditions being as nearly as ponnible counterparts of those in the first experiment, excepting that minute drops of water at a temperature of \(45^{\circ}\) Fabro, were placed on the leavea instead of particles of ice. A diseased opot appeared at each point previously occupied by a drop of water, and showed all the microncopic characteristics of true "spot." Namerous additional experiment. with the object of determining the minimum depres.
sion of temperature necsasary to produce the direate, howed that the formation of "spot" could not be indaced by a fall of lean than \(9^{\circ}\) Fahr., from the average temperature in which the plant had been previously growing. One other point in regard to temperature was clearly demonatrated by the ex. perimenta, viz., that plants which had previouly grown in a high temperature, became diseased at : much smaller reduction of temperature than plasta previously accastomed to a comparatively low temperatare.

In condazting the experiments deacribed abova, irregularity in the appearance of the apots in different pocimen of the same specie, even when conducted under precisely nimilu conditions as to temperature, howed that mas other undetermined factor exercised an influmen, After repeated experiments this proved to bothe relative amount of moisture present in tha phath After a pseudo-bulb with it accompanying leal had been removed from a plant and allowed to remia for three days in a dry piace, it was foand imponible to produce spot by the method mentioned abone, whereas with a similar pecimen removed from the aame plant, and having the preado-balb placed in water at once, fully developed " pot" could be produced in four daya. Similar realta were obtained when experimente were made with entire plant; those copiously applied with water at the root, and grown in a high temperature, "ppotting" readily; whereas plants in a resting condition, scantily supplied with water and kept in a low temperature, usually renist all attempte to produce "apot" artificially.

It may be mentioned that, other condition being equal, "ppot" can be produced with the greatet certainty, and in the shortest amount of time, when the experiment is conducted in an atmosphero saturated with moisture. This agrees with the experience of gardeners, who state that "apot" in most prevalent in foggy weather.

Experimente show that "branissure," or browning of Vine-leaven, when the plants are grown in the open air, can be caused by the following combination of meteoric conditions. A copions deponition of dew and rapid fall of temperature, following heaty rain. Similar condition produce the disease in tho leaves of Tomatos, which has been deacribed by Abbey* as due to an organism named by him Plasmodiophora Tomati.

\section*{Summary,}

The Orchid diaease known an "apot" is of note parasitic origin; the initial cause being the presenco of minute drop of water on the surface of the leave at a time when the temperature is exceptionally low and the roots copioualy supplied with water.

The effect of the chill prodaced by the dropt of water under the above-mentioned conditions, is to cause plamolynis of the cells of the leaf underlying the drops : this is followed by the precipitation of tannin and other sabstances, and eventailly the complete disintegration of the celle.
"Spot" in the broadeat sense of the term, whicis would include the effect of exceptional moteoric conditions on the living parth of plants, more eapecially the leaves, when growing in a state of nature, it, in the case of cultivated Orchid, manily, il not entirely, caused by the three following conditiont 1, too high a temperature; 2, too much water, and not anfficient air in contact with the roots; 3 , watering or spraying with a falling instead of a rivich temperature. George Massee, \(F_{0} L_{0} ._{\text {., }}\) a princip Asistant, Royal Herbarium, Kew, in "Amnaid by Botany," October. [The original is accompanied by a coloured plate showing the microncopical changel referred to.-ED ]

\section*{KEW NOTES.}

Furcega atcantra.-This plant may now ba neen in flower in the Sacculent-house at \(\mathrm{K}_{\theta \text { w }}\), or rather outside it, the apike having pushed up through the roof to a height of 25 feet. The plant, which has ucarcely any atem, conaiat of a large rosette of about aixty leaven, which are about 5 feet long and 6 inches broad, spinelens, bright green, and is a atriking object even when out of flower. The spike beare numerons branches of whitish star-shaped flowers, 2 inches acrose, and drooping. The plant will, of course, periah as the result of flowering. The lat time this apecies flowered at Kew was in 1874. This is one of the most important of fibre-sielding plants. It it klona commercially as the Maritio Hemp-plant or Green Aloce (Alcös vert), having been many

Ptrcatrnia terrcuinea.
There is a large example of this, the largeat of all the Pitcairniae, in the Temperate-house at Kew, where the comparatively cool temperature appears to suit it, the head of leaves being fally eight foet through, and perfectis healthy. This year the number of flower-ncapes it has produced is larger than usual-they are 6 feet long, branched, clothed all over with s dense ruat-like down; the flowers, which are 4 inchen long, are at firat of a pale steelblue colour, afterwards changing to white. According to Mr. Baker, this apecies attains to a height of 12 feet, with antem as thick as man's arm. The Kow plant has a atem 6 inchen in diametor, and about a dozen brancher or rosettes of leaves; these are about a yard long and 2 inchen wide, shining green above, whitish beneath, the margine armed with stout
house at Kew. The bright weather we have experienced this year has given us more flowers than unual in the Cactus-house, and if we could be certain of auch weather evary year Cacti would soon find general favour. C. triangularis is one of the oldeat of cultirated Cacti, a plant of it being recorded in the Hampton Court garden in 1690. The utems are stouter than those of mont of the night-flowering scandent apecies, diatinctly trigonous, and the flowers are a foot acrow, the narrow reflexed sepale coloured greenish-jellow, and the lanceolate petal milkwhite with a large cluster of bright yellow atamens flling the whole cup. The Kew plant is trained along the rafters of an unthaded house of intermediate temperature, but it would be happier if trained againat a wall to which its aerial roota might cling.

Cattleya elongata (C. Alexandere),
This is again in flower at Kew , and again falls short of what we were led to expect when it was first introdused. It has an erect scape 1 foot loag, bearing three dowern, each haring a pedicel 2 inchea long, and measuring 2 inches across the regments. The colour of the sepals and petals is a coppery brown, with a lash of rose about the tips, the lip being deep rose, above which the white top of the column shows conspicaonaly. In a broad sense, I ohould say this is a form of C. gattata, although for garden parposes it requires to be distiogniahed on account of the length of the pedicels, the waviness of the petale, and the peculiar colour of the sepals and petals. It grows well when treated as at tropical Orchid. The name preferred here was given to this plant io 1877 by M. Rodrigues [Orchid., Nov. 1, 72 , Ex Indice Kewensi], fifteen yeara before it was named C. Alexandm, by its introdacer, M. Linden.

\section*{Stanhorea Haselomiana.}

We have had this plant in calcivation three years, thanke to an importation of it by M. Linden, although is wat described by Reichenbach forty years ago. It is one of the handsemeat and largestflowered of the many upecies now known, and it is as easily managed as auy of them. The Kemplant is now in flower, filling the warm Orchid hoase with a delicious fragrance, and delighting visitors with its extraordinary 10 m and delicate colours. Before the segments curled beck each flower was fally 6 inches acroas, and colcured pale creamy.yellow, with a suapicion of apricot in it, the whole being dotted over with irregular ring-like blotches of lilacpurple. In stracture the flower is not anlike S . Wardi, from which, however, it differs in baving the menochil, or middle portion of the lip, being anazaally long, as well a in being mach larger, and different in colour. To those who caltivate this beautiful genus I would recommend S. Hatelowians as a plant worth procaring. A figure of it bas been prepared for the Botanical Magazine. Mr. Rolfe thinks S. Moliana, figured in Lindenia, wil., vo 333, is probably the same apecien. W.W., Kevo.

\section*{Florists Flowers.}

FINISHing the bloons of chrisanTHEMUUS,
If blooms of the finest exibition quality are to result, the finishing processes must be closely attendd d to, or the ten montha' labour and anxiety will be thrown away. If anitable accommodation existe this last phase of calture is quite simple, but not so if the hoases are unfitted lor the proper development of the fowers in the month or six weeks previous to their opening. The worst kind of house is one that is lofty and lacking in light. Sach houses are asually much too moist, caneing injury to the petals and lengthening of the flower-stalk, with consequent weakness long before the blooms are fally developed. In this kind of house the condition are sach that the bads do not awell astisfactorily. Sometmes a seaton's labour is thrown away by a single act of carelesiners on the part of the gardener or his arsistants, or by want of knowledge as to the requirements of the plants at that time.
Alter the Chryeanthemuma are housed and the colour of the florets is visible, developing bigins. It whould be remembered that buta which have became deformed ever so little cannot becump perfect flowers, and it is better to remove thrm and thos relieve the plant. The blooms that remain will be all the better if the energies of the plant are spent apon two bloom rather than three, which is the usual nauber allowed to each plant.
It is seldom that a house can be devoted entirely to Chryeanthemume, although it is beat if it cas be managed. A span-roofed greenhouse afford good aceoromodation for the plante in the final atage of growth; and in such a howe the tints of the blooms ought to be of greas excellence, owing to the aboundant light and air enjoyed-and it is apon these two points that so much depends in the finishing of the
blooms. Generally, Peach-house blooms. Generally, Pesch-housee or vinerien, after
the frait is gathered, are utilised for Chy yanathemama
and here also the plante obtain enfficient light aud air; moreover, the foliage in the case of the Vines useful as ebade for the 目owers. The Vine leaves mant not be left too thickly on the rods, or epinding will occur. Air must be afforded day aud night till the bloom are generally expasding, when some reduction in the amonnt of air admitted may take place; an at that atage I objecs to a direct carrent passing over the plants in such a manner as to cause a draught, the more eapecially when-as is sometimes the case-the house faces north or east. If the weather is cold, wet, or foggr, use slight artificial beat so as to ensure buoyancy. The air should be admitted freely at the frort, and ame at the trp of the house. Sbade of gome kind is alpags cecasary while the blonms are expanuinis to and the shade should be of a temporary character becanse of the importance of light in dall weather. The plants eheald not lack maurial asaistance, although aome provers moud have is buidre that directly the colour of the forety focures wiztho manuring chou!d c+ase. This is a fallacious practice, the plant requiring feeding as moch then as at any time. My practice is to feed the plant until the
bloomsarethres-patsexpanded, and then torffod no bloomsare thres-partsexpanded, and thentorffind
more. The kind of manare should be varied, and affording atrong doses of any one kind is bad for them-weak and offen is a much moro prudent practice; besider, the same kind of stimulant always afforded, cerses to have sug goud effect. A return to pare water only for two or three watering is conducive to succesp, especiaily where animal manure have been employed, the char water acting at a parifier. It is allowed to be more difficult to fanish an incurved tban a Japanese bloom. If the latter are large in diameter and depth, the petall proportionate in breadth, and the colour rich and clear, and the florets evenly diaposed so as to form a perfectly symmetrical flower, everything necenary in a Japanese bloom is attained. Bat in the incurveds we must not only obtain size, bat also depth, and what is perhap more important, molidity of petal; and bloums which lact any one of these requirementa are not perfect. If ina dinimatar of a bloom of any of the "Queen of Fongland" sertion is 5 inches, and the depth 2 isches, the bloom is not properly developed.

I have, perhape, entered rather tco fullo into the ree quirements of the blonm, and enpecially those belonging to the incurved aection; but havingeen so many mistake made by exhibitora in igooring esential points, I am impresed with the idea that beginner cannos have the matter placed bofore them too plainly. There is too much haviering niter sibo in incusved flowers, add beginners sometimes have the idea that early crown bade give the largest bloomeand so they will in diameter, perhaps; but if they are "taken" before the middle of Auguat, the blooms are sare to be rongh as well a "thin," and quite uselesm in competition against flowers that were not taken until nomewhere near the 25 th of the same month, or the following wetk. Earlier-formed bude develop florets that are more inclined to reflex tban incorve, when this tendency is common. In thesecarem the cprning blooms ahould be turned upaide down by removing the branches from the npristht stake, and making the branches equally aafe by nome othar meanm. In the case of vineries or Peach-honses being pmployed, I qually tio the branchea to the wires, ard h) fot the blons downotris. In this maroay the thate incurve much bettar than they will du when growing upright. Jaily attelition ia rocnequy in removiog mis-bhapen peia!s, for all the berming in the world will not make all the petale grow towarde the centre. If thege deforman putas ane Thioutd, these of parfect abapa will that their flaces, and grow evenly, making a perfect blorin. By following the detaile here given, the work of Areang the hiomg is much facilitate di when they are cut and ready for the exhibition atand.

Japanese bloome can be much improved whilet opening by the ame meare. Sometimes, the planta having received a check at the roots in aome way or other, development in the flower is retarced isstead
of unfolding evenly and straight, the tips of the florets curl inwards, which is a deformity. A litus attention paid to relieving such by the aid of tho twetars, is time we!! wiont The development of the blosing way he wech retarded if insect peato of not well looked after. Kinnes. are very tronble. some, being partial to the succulent petale, sod they will climb aimost any height to get at them, Trap made of Eimboocine or Bean-atalke 1 foot long thrust in amongat the leaves, atill conatitute the mon tficacious manrar of checking their progren and depredasionm. E. Molyneux.

ORCHIDS IN THEIR HOME. We diserobark, say at Savanilla U.S. of Colombin, at the mou!h of the mighty Rio Magdalens, Tae rirer is navigable for a diatance of 600 miln, and under favourable coaditions, the rogage ill take frone utus totern days, whereas under mend circuaztances is might take fifteen to twajn The lown parts in ROD witior mach of interest the
 swaps. Indeed. ing atertcims are iundatd, bot
 appear. Wiost of the heabitsistons are built of Bumboo
 liamboo poles speured in the ground, with a her lages at (Cous batyracea tied on for roof and mallh 'Iite prircipal fuoda are corn, rice, Banana, ad luccas. 'Ine iatter are the tabers of Manihy utilissinas (known in commerce as Tapioca).
The vegetation on the Lower Magdalena is somewhat monotonous, bat, gradaally ascending, the number of anpcias increapes. The acenery in mas places is magnifcent; imagine the river bantu covered with trees or shrabs of all descriptiont, festooned with Vines and ciimbers down to the waterl edge, forming a dense mass, here sud there brightend by the presence of lovely flowera and bearaifull. colonred birds. Bahind this extends a beartitiol landscape dotted with Palme, and in the bactground the blue chains of the Cordilleras, towering one above the other. The collector will feel not a litite ? inappociatmi hy the almost total abrence of Orchid difuge the riyner, if it be his first trip.
After the terminus of the Lower Magdalens in bached a ahort ralroad takes the traveller to Honds. Hara the river forme sume mighty rapid, Which rivide the Magdatens into sectione, the Upper and the Lower. From Honda the only mean of tranaportation left the traveller is on male ot horseback. Arter three or four daya' hard riding os a stauborn mule over bot plaing, wading riverh, climbing and descending hills, Ibagas is reacheph The latter used to be, and still is, to a certail extent, the centre for Cattleya Trianæi. Howera, at present the plants are becoming very rearco there. Ebasue in situated at the foot of the Tolims, a nowy peak, forming part of the central monntail chain of Colombia, and at an elevation of 4000 fet above sea-level.

\section*{Where they Grow.}

One of the munt important items to the collector is the fiading of a cood district, not ouly mberf plants are abundant, bat also where a good arnin of varieties may be obtained. This involvea a greal many hardships and inconveniences, bat it certainly payn, though a gond deal of money and time han to to npent before obtaining reau! platita are mentiful and infpeasily procured, the col

 menciog to gather the plante, a good ceatral plad must, bu wolected a head quarters-a place nituak inte if posible, in the district itsell, or in the immediat catseirts, or, is short, in some place from wati there is an exis pormitting the collector to tranport the plant on mishback. By head-quarters 1 ion io a fex trivciug or ten's pitched for the cecsion maten Which to storen an! diy the plants and mase cam \&:.Wheutagis o. rinctwa are resty, men aro and out in differens dipecicing in parties of that holl three, after prefinaily b-ing ohom what nad to collect. They carry provisionn to lat them in the times for two weeks. They bury themelver in why monntaing, ready to deatroy angthing in thair
baraing en Orchid. Whenever a plant is detected, the tree it cat down and the plant torn off from the trunk or the branches. The plants are packed in attring bage, and carried down to the ranch. The vegetation io most exaberant in the Cordillera monatains, with their apara and hills ; rivers and atreamo, forming valleys and gullies, hollows and precipices imposible to dectribe or imitate ; and in thees secluyed localities it is where the Orchids luxariate, and where they dieplay their magnificent Howera to the best adrantage, inviting the collector to come and pick them, yet oftentimea defying every sttempt to capture them. If the collector is a lover of plants, he will here ree Nature in all its marvellons benaty. For a moment or two he is likely to forget himeelf, forget all hardshipt and worries, while a feeling of enthatiasm ateals over him, leaving an impretion which be will not moon forget. J. E: Lager, in " American Gardening。"
(To be continued.

\section*{pea Trials in Lincolnshire.}

Whrn at Boston about the middle of Jaly, I had an opportanity of seeing a large and very racceasful trial of Peas in the seed-trial grounds of Mearra. W. W. Johnson \& Soas, reed merchants of that town. Mr, Alfred Johnson had epared no pains in getting together all the new varieties he could obtain; the seeds of which were sown in good groand. Every trial sample was ataked, and all that good cultivation could do was done to ensare a complete test. To add to the success of the trial, the weather had proved highly favourable. For while the sonthern midlande, London, and districts stretcoing to the sea had felt the drought everely, mott refreshing rain-nhowers had visited the B aston dintrict; and while the patcare in the South was brown, in this portion of Liacolnshire it was living green. Peas had, therefore, done well, they had made a healthy clean growth, and developed fine well-filled pods.
Taking the earlieat varieties, William Harat and Eaglish Wonder (Barbary) led the way. The earlineas, dwarfness, cropping qualitien, and good character of William Harat are well known; not so in the case of English Wonder, a dwarf early wrinkled variety, with dark green pode which fll well, the pods being a little pointed. I have heard this Pea so well spoken of in differeat parts of the country, that I am gratified to have my own high opinion of it confirmed ; it is an excellent Pea for small gardenn. Satton's A1, an early indented variety, will be found very serviceable to those who prefer an early crop of the Ringleader type. Bat a coming early Peawill be found in Satton' Szedling, a dwarf, firat early, wrinkled variety, growing atrongly in the fertile Lincolnubire loam, and not exceeding a foot in height, the pods pale green in colour, a little pointed, and well filled with fine Pers. As it was sent out only in the present year, it may not be widely known, bat visitors to the Temple Show had an opportanity of seeing bearing plants of this Pea in pots. Satton's Favourite Marrowfat, new in the present year, was doing well also, \& wrinkled marrow, prodacing palecoloured, broad quarestipped pode, well filled, the plants bearing freely, height 20 inches or so. Chelrea Gom was here also, closely resembling William Harat, from which it is a sapposed selection, but with pods more cimitar-shaped. Dainy, growing here to the height of 2 feet, is an excellent garden Pea to prodace an early crop, it beara large fall-pointed pode, and it in an excellent cropper, and valuable for mall garden. Witham Wonder, appeared to be a curved-podded variety of the Eoglish Wonder. Stanley (Horsford) is a promiaing Pea, a little taller in growth than Satton's Seedling, producing large full-curved whitioh pods, and an excellent cropper; like the preceding, a very aneful variety for amall gardens. Plentiful has all the character of a green form of Day's Sunrise, growing to a height of \(2 \frac{1}{2}\) feet, coming in after William lat, a rare cropper, prodacing atraight well-filled pods, to all appearance a very prolific and bardy Pea for market gardens. Gradua, aonounced an a large-podded firat early wrinkled variety, prodaces fine-pointed pods of the character
of those of Dake of Albany, bat the work of selecticu is by no meane complete, jadging from what was seen at Boton. Bat with rigid selecting, a very gnod ispa of early Pea is likely to be produced ; in beight it is about 2 feet. May Queen, ent out by Menne. Sutton \& Sons as firat early wrinkled variety, as early as American Wonder, is one of the earlieat in flowering and podding, and produce a fairly good crop of medium-sizad pale pods. Here it was about 18 inches in height; it in an early variety well worthy a trial. A green form of Earliest of All doe well in the sandy soil of Lincolnshire, and is considered valuable for markat purposes. Saston's Bountiful is a fine Pea, bearing pode somewbat curved as the pointe; it is in the way of Gladiator, but moch earlier. Satton's A 1 Marrowfat, which followa their May Queen in bearing, is a first-class Pea, having wellfilled poda of good size; it should be noted as a valuable garden variety, at Boston it was from 2at to is feet in height. Sutton' Esn press of India is like the forpgoing, \& valaable garden Pea, it has large wellfilled pods of the Dake of Albany type, somewhat pointed, a variety which sppears to be becoming very popular in the country, height \(3 \frac{1}{2}\) feet; it comes into bearing directly after Whiam 1 et. Oracle (Laxton), vent out as a main crop variety, producen very fine green poll and foliage; the dry reed a blue ruund, somewhat wrinkled; a econd early of a fine robut growth-the pods containing on an average ten Peal. This a variety that appears to suit Lincolquire well, and it growa to a height of \(2 \frac{1}{2}\) feet. Gludiator may be dencribed an in the way of Telegraph, but earlier, pods large and curved, \(2 \frac{1}{2}\) feet. The foregoing mas be aid to form the nection of first and second early varieties.
Among the main crop Peas, Laxton's Alderman mut find a place; it grow to the height of 5 feet, and produces handaome large green pode, "ike those of Dake of Albany; and whether employed for garden or exhibition parposes, will be greatly esteemed.

Eckford's Critic, growe to about the ame height, and produces very fine blunt tipped pods, and as seen here well deserved the three merks given to it in the Cbiswick trials. Satton's Royal Jabilee is a very fine late Pea, probably one of the lateat, bearing large acimitar-hhaped pods, 3 feet in height, very robut in growth. It may be deacribed as a late Windsor Caste-its appeara to be a Pea witha great future before it. Dase of Yurk has appearance of being a selection from Dake of Albany, but earlier, and likely to be very usefal. Censor (Eakford), is a Pea growing to the beight of \(2 \frac{1}{2} \mathrm{f}\) et, having fine fall dark green pode, slightly incarved, certainly a very fine garden variety. Yorkshire Hero was also here represented by a very fine atock, and still hold its own despite rivalry. Sharpe's Q deen is a very robast grower, about 3 feet in height, pode large, green, slightly curved, a great cropper of a fine quality; apparently of somewhas delicate constitation, as it is subject to mildez. Su:ton's Perfection Marrowfat appears to resemble the foregoing in many respects, but to all appearaica a more robust grower. President Garfild is a Pea said to be difficult to keep trae; is is of the same style and quality as Priace of Wales, but the saed is larger and more wrinkled. Prince of Wales in an old Pea of good quality, bus needs improving by mean of rigid selection; it is in considerable demand in some parts of the country. Conaummate (Eckford), is very like Sharps'e Queen in height and general appearance. Satiefaction, in height \(2 \frac{1}{2}\) to 3 feet, bars very fine and well filled pointed podr, and is said to be of excellent quality. Dr. Maclead, a fine old variety in considerable demand in the West of Eogland, was also here in excellent character; and Veitch's Perfection, atill a fine old garden Pea, was represented by a very fine true atock which crops 'wonderfully well, and which jet remaine one the most nsefal garden Peat. Invincible (Jobnson), is a blue wrinkled variety, 3 各 feet in height, bearing freely, very fioe, alightly curved pode, the quality high. Autocrat is a mont valuable late Pea, with medium-sized dark well-flled pods; a dwarf No Pla Ultra, height 3 feet-it is ex-
cellent for elasing at late exbibitione. Satton'a 11 arar Mammoth Marrowfer is a very fine garden lea, producing immenee alightly-cusped pode, extra fize \(f: r\) tyitition, hight is feet. Sutton' Conquer.r burs large white moin which curve back a litime uth painte, and the puls are aptu to be a litte indented; a very fiae variety, in height 3 feeta new I'ea of the preseut year. Suiton' Late \(Q\) zeen in also new of the present year, pod the shape of that of Ne Pus Uitra, a little paler in colour, a robust grower ard free cropper, and \(a\) fine garden variety, 3 feet. A Pea of unaaual excelleace in foand in Jubnon's Uaivalled, a daarf and prolific wrinkled Marrow, nomewhat of the character of Telephone, with large bright green pods, averaging ten Pean in a pod; height 4 feet-a fine and robust garden variety. A variety named George Celland in a robust grower, with dark foliage, lorg deep green pointed pods of the Queen type, very promiaing; the planta were from of late sown ample introcanced from Araerica. Satton' Windsor Castle appears lita a relection made from their Royal Jabilee on accornt of it lateness ; of robust growth, free croppiog, large pointed, well-filled pods, very prolific, an excellent garden variety, height \(3 \frac{1}{2}\) feet.
Of the taller section, Hzkford's Wpicard is an illutration, growing to the heisth of 6 feet, large, alightly curved Telephone pods, and a great cropper. Boston Hero, also 6 feet, is said to be the result of a croun between Dake of Albany and John Ball, and in Lincolnshire it requires to be grown in a rather dry, hallow soil; in a generous one, it gee very much to haulm-it is a very free bearer. Wem (Eickford) is a very tall grower in Lincolnuhire, producing very large whitioh pod of excellent quality in the weds; it is a free cropper. Memorial (Eck. ford) is a deep green wrinkled Marrow, growing quite tall, with very long, llightly-pointed pode, promining to be very fine for extibition.

Ia the next group appeared Telegraph, represented by a very fine stock, a variety in great demand in Yorkebire; a Leeds seedeman informed me that he sold more of this than of any other variety. Goiiath appears to be a round-needed form of Telephone, and jet diztinct from Telegrapb. Harrison's Giory and Bedmen's Imperial represent two varieties largely grown for cooking purposes in winter; both were fully podded. Day's Commander appears to be King of the Marrows; Ambasador, a pointedpodded Ne Plus Ultra; Goldander, a very fine atceck of Ne Plus Ultra, as it is exactly like it. Dake of Albany, ene of the Peas most generally grown, was very fine here.
I had opportanities of seeing nome of thena Peas growing in large breadus in open fields, where, they were, of course, not staked. Here Satton's Bountifal was very fine, apparently ready to gather four or five day after Earlient of All: a fiae market variety. Eoglish Wonder wan reaily aperb in the open, atearly as any variety, green in foliage and pod-literally a mase of well filled pods. So prolific is it, that I was informed a short time ago by Mr. J. Perkins, of Northampton, that he had harvested \(5 \frac{1}{3}\) buabela of seed from 1 gallon of seed - a return of over 44 fold. Saiton's Early Marrowfat is alsu a very fine market Pea, bearing heavily. Sutton's Dwarf Mammoth Marrowfat may be regarded an an improvement of Stratagem ; on an expenaive plantation the individuala were found to be bearing large, well-flled pods in pairs. Windsor Castie is mieo a fine field Pea; the ame may be said of Invincible. Market gardesers whould keep an eye on both of thene. Satton'a Exhibition Marrowfat ander field culture prodace large curved pods, and is a great cropper-a fine variety for late exhibitions ; height, 3 f feet. Dake of York (Cooper, Taber \& Co) aeemed better under field calture than when taked; it wa producing a wonderfal crop of fine pods. Saperabundent (Fcckford) wat very fine under field culture; it is a flat-podded variety, and very prolific. Satton's Magnam Bonum Marrowfat, which grows to a height of 3 feet, is a prand cropper, producing tery fine pale-green pode, alightly curved. (iradus (Harrison \& Sont) was in the geld as early en lislitat of All; it bearepointed
pods, is a great cropper, and excellent for field caltare. Satton's Royal Jubilee in a vigorons grower and heavy cropper under field culture. Critic and Centor were also very good.

That it may be fairly aaid we have too many Peas, there can be no doubt. Menme. Harst \& Sons' catalogue for the present year contains 122 names, and of these a few may be accepted as synonyms ; perbaps the growth in numbers is not very remarkable after all, for their catalogue issued in 1852 contained forty-nine varietien. It is perhaps well to have an ample choice to meet individual tastea, and adapted to certain localities ; still there is an amount of bewilderment in the contemplation of momany, and the differences between nome are only very alight. Perhaps the old adage, that it is possible to have too much of a good thing, may be accepted in the cane of Peas; and it does appear an if the list is likely to be extended rather than reduced. Certain it is, that no one who valuen Pear an a cooked vegetable can fail to have his taste gratified among no many claimanta to his farour. R.D.

\section*{BERLIN.}

Cypripeditum Charlesworthii in one of the beat Cypripediums of ita class, as was shown here at the latt meeting of the Horticaltural Society, by Mr. Lackner, of Steglitz, near Berlin. Young planta imported in 1894 were beset thickly with flowers; a good many of them bore two flowers upon one atalk. There were two forms, one with the upper repal folded backwarda, thas resembling C. Spicerinnum ; the other one with this petal quite flat. In the large collection exbibited there were differently coloured forms: the mont interesting one, an imported plant of this year, had a dark red petal. Vanda Kimballisa is also a fine plant when in flower. Mr. Lackner exhibited more than 100 plante, all flowering at once-indeed, a fairy-like picture. The cat flowers of this, as well as of the Cypripedium, keep fresh in water for over three weeks, whilet they last upon the plant for from two to three month.
A very fine new Dahlia of the Jaarezi group, the colour of "La Reine Rose," won a First-class Certificate from the Horticultaral Society. The grower was Mr. Schwiglewiki, of Carow, near Berlin.
Helianthus rigidu [?] is agiant amongat Sunflowers. A flower-stalk of 4 mètres 35 centimètres (about 14 feet), was exhibited at the last meeting.
A large International Horticaltaral Exhibition will be held at Berlin in the epring of 1897, when the Horticultaral Society will celebrate its seventy-fifth birthday. The Society hat granted 50,000 marks for medala, \&c. A new feature at this exhibition will be a section for amateura. It is proposed that only auch amateure ae grow their plants without any help from a gardener thall be allowed to exhibit in this wection. Another clause ran thas, that only such plants thall obtain a prize as have been cultivated by the exhibitor for at least one year. Of late yeara it has been observed more and more here, that the highent prizem are taken not by much gardeners an coltivate the beat plante, bat by those who have the most money, and can therefore buy up the most and beat plants. The amateur nection of the Horticultaral Society think that this is wrong, and therefore has framed the above clanse, which will bring the prizes within the reach of the best growern.

\section*{Palats in Livine-Rooms.}

Some good Palma for living-rooms are the follow. ing, jadging by those in my collection, Elais gaineentic, the Went African oil Palm; it grows thus very well, almont better than in a nurwery. Pinanga javanica: this highly interenting Palm is somewhat difficalt to root. I potted my plant in a large pot, containing samodnut, wo that the earth maintained an more equable temperature ; since then
the pleat has grown rapidly the plant has grown rapidly. The lesvere sare reddish
when young, and aterwarder when young, and afterwards become bright green.
Chamesodores corallina neede time before it can
accommodate itelf to the dry air of a living-room, as the older leaves are apt to turn black; but once acclimatised, it growa rapidly. A very fine Palm, which is quite hardy, is Martinezia caryotifolia; it grow very well. One of the most rapid growern is Wallichia caryotoidea, of which I have young planta about a year old and a foot high; they have from five to nix leaves. My Phoeniz humilis is a mont delicate plant; it is like Cocon plamona in habit, but of as gracefal form as Cocon Wedelliana. This latter gave me mach trouble at firat, until I learned that the plant disliked mach water. It became yellow when I watered it too much; it is now turning darkgreen, since it has received aa little water an possible. The Cocos Datil, on the contrary, cannot get water enough; indeed, it is a plant which grows best in a swamp. Here it in a short time attains immense dimennions; my specimen, one and a half year old, in sbout 1 métre ( 3 feet) high. A somewhat more difficult plant to grow is Areca rabra. I had two large apecimens, one more than 6 feet high. Both died without \(m y\) being able to tell why. Now I am experimenting with a young plant about a foot high; this is doing very well. A very hardy and fine Palm in Hyophorbe Verschaffeltii. Very variable plants are the Chamærops humilis. I have three large specimens, but all three are so different one from the other, that they might well belong to three distinct apecies. My collection of Palms, containing some thirty species, and aboat sixty or seventy speciment, gives me much pleasure, as I grow the plants from weed. The plants are accustomed from the first to the dry air of a room, and many a specien, cultivated in the hot house in nurteries, grown well in my room: without any other attention than a protecting pot containing raw-dust-for, as I have found, the roote are the weakent organs of the Palms.

Ageratum mexicanam flore roseo: this longdenired variety, with pure rone-coloured flowert, was exhibited by F. C. Schmidt at Erfurt; the new variety will certainly become popalar in gardens. Paeraria Thanbergiana is a leguminous climber from Japan; its habit resembles a giant Bean, and in foliage also. The flowers, crimson-red, are set on long, straight spikes, which appsar on the outmost apex of the plant. The plant, is perennial, quite hardy here at Berlin. Its greateat meritiry, that it grow rapidly; a two-year-old plant in the nursery of Mr. Späth, at Rixdorf, near Berlin, who imported the seeds from Japan, measares now about 12 mètres (about 36 feet). Amaryllia Belladona does not thrive when grown in pote. A very fine plant, with over a dozen flowers, was exhibited by the gardener of the famous Wörlitz Park, near Dessan, at the last meeting of the Horticultural Society at Brrlin. It is hardy at Würlitz, where it grows best in warm, sunny borders near walls; here at Berlin it is necessary to protect the plant during the winter. Paulownia imperialis, which here muat be protected during the winter each year, and which, notwithatanding, often dies, is best grown as an undershrab. If the plant is cat down yearly in the autumn to a foot high, and then protected, it sends up in the apring a great many hoots, the tallest of which reach a height of more than 4 mèbres ( 13 feet). Treated than, the plants form bushes of unrivalled beauty. U. \(D_{\text {. }}\)

\section*{Orghid Notes and Gleaning8.}

\section*{Epidendrum Godserfianum.}

This is perhape the most handsome of ita section, and well away from the merely botanical clase of Epidendrum, its tall branched apiles of large yellowground coloured flowert, veined with parplith-brown, and with ample white lip veined with bright parple, making it a really handsome arecies. As it flowers endure for a very long period of time, it is a very deairable plant. It was imported by Meurra. F. Sander \& Co., of St. Albans, with the true Cattleya labiata, and named in honour of the manager of the Sto Albana Orehid nurwery.
A very fine form of it in flowering with C. J.

Lacas, Esq, Warnham Court, Horhham (gry
Dancan). Cymbidiom ciaanteum,
Although one of the earlient-known speciee, wh one which has been represented in collection thy over aixty years, this fine apecies has becomon int although it has much graca and beants. Amp fine variety, having long aprays of fowers, is oflo yellowish, closely atriped with parple, and mit bright yellow lip spotted at the bate with port and at the apez with brownish-red, is in fomen Sunningdale Park gardenn. The plant in ond a small collection brought by Mr. Joiceg, jum, ham the Himalayas.

Sobralia Lindeni.
Under thir name a few fresh impoted and Sobralia were sold by Messra. Linden, al Bram
 on Saptember 12, 1893. A flower frua memine then parchased is kindly forwarded byc.a. Linem Esq, Warnham Court, Horsham, and, u Mi, Lam saya, it certainly a most charming apeia, The flower is large, the repals and petalis of s diate blum-white, and the lip is also bluab-white on we bassl half, but the front portion is of a rimem crimson-purple, shading off into a nearly blum tif toward the margin. This finely-coloured muin traverned by well-defined branching white bim which make it a very diatinct feature. Ahs tance the flower revembles a light form of Culm Laddemanniana.

\section*{THE PUBLIC PARK AT DAB. LINGTON.}

Most large towns are now in possention of pobis parke and flower-gardens, but few possen one thit has so many charming features as Darlington in it situation and arroundings. It is distant bat lifl from the centre of this fine old town, which, anm other things, is celebrated for its connection nith George Ssephenson, of railway fame, and consiaini the railway atation the redoubtable No. 1 engine tender by which the firct railway journey wa med Darlington was honoured thin year by a vinit of th Royal Agricultaral Ssciety of Eagland, and th many visitors to the town which this visit occariow were drawn to the pablic park, whose axcalls keeping and numerous fiae features came in for \(m\) deserved ealogy. The approach to the chief eataw to the park on the town side in broad, wellb by road, bounded on the right by the river Stenn the public gymaaniam; on the left, by a rond villas, having well-kept front gardens. The put together with the lake, has an area of 46 ampu entrance is made to the park through ornawid gates of iron, having lodges at the siden, and show road with an avenue of promising Lime.freas were planted fifteen years ago when the part wh onclosed by the corporation of the town. Sinu tw time, much work in laying-out, tree-plantiad otherwise improving the park, has been carried by Mr. James Morrison, the superintendent.

The natural nadulation of the ground 10 itself well to the methods of planting and badit out which are adopted, there being 10 diabli geometrical desiga of flower beds, but nuat 1 fresh and novel takes the eje at every tans, pavilion and aperintendent's house are bape blot situated on the terrace; on the gran avilion, the terrace and in front of the pariand bid five designe in carpet bedding; the cours of the five being a large circle, carefully 30 to represent the arms of naked of Darliagton, surmounted by \(N\), 1 andeth holding a pickaxe; below this the No. and with two tracks, and the bales of wool, and head of a ball; on the quarter earroariantioni arm: the words "Invignis Bargi de "Fiores" is and below in the motto on a acroll, "Somentin dustria." The groundwork connista of are tomentona; the engine and bull's head tho out with the dark-leaved Ajaga reptans, the and woolpack with golden-leaved Prom that a bordering of a dark blue Lobelia arimul
bed which are on either aide of the borough arms, represent eight rayed atars, outlined with Echeveria glancs, the centre of one of them containing a representation of the royal crown, in Pyrethrum, on a groundwork of Herniaria glabra, the jewel being represented by crimson and blue fowers; the other bed is planted so as to represent the creat of the Prince of Wales, the feathers being worked out with Mesembryanthemam cordifolium variegatum and Pyrethram, and the motto, "Ich Dien," is ahown on a groundwork of dark green. The bed. at each end are circular, and are aurmounted by a crown ; in the centre of the circle are the lettert R. A. S. E., the monogram of the Royal Agriculcaltural Society of Fiagland. This is enclosed by a Garter, bearing the motto of the Society, "Practice with Science;" and below each bed, on a acroll, are the word. "Welcome to the Royal." TThe Darling-
